It may, at firſt view, appear ſomewhat odd and fantaſtic, that adjectives ſhould, in the ancient languages, have aſſumed ſo much the form of ſubſtantives; ſince neither number, nor gender, nor caſes, nor relations, have any thing to do, in a proper ſenſe, with mere qualities, ſuch as, *good* or *great*, *ſoft* or *hard*. And yet *bonus*, and *magnus*, and *tener*, have their ſingular and plural, their maſculine and feminine, their genitives and datives, like any of the names of ſubſtances or perſons. But this can be accounted for, from the genius of thoſe tongues. They avoided, as much as poſſible, conſidering qualities ſeparately or in the abſtract. They made them a part or appendage of the ſubſtance which they ſerved to diſtinguiſh; they made the adjective depend on its ſubſtantive, and reſemble it in termination, in number, and gender, in order that the two might coaleſce the more intimately, and be joined in the form of expreſſion as they were in the nature of things. The liberty of tranſpoſition, too, which thoſe languages indulged, required ſuch a method as this to be followed. For, allowing the related words of a ſentence to be placed at a diſtance from each other, it required the relation of adjectives to their proper ſubſtantives to be pointed out, by ſuch ſimilar circumſtances of form and termination, as, according to the grammatical ſtyle, ſhould ſhow their concordance. When we ſay, in Engliſh, the "Beautiful wife of a brave man," the juxtapoſition of the words prevents all ambiguity. But when we ſay, in Latin, "*Formoſa fortis viri uxor*;" it is only the agreement, in gender, number, and caſe, of the adjective *formoſa*, which is the firſt word of the ſentence, with the ſubſtantive *uxor*, which is the laſt word, that declares the meaning.

"The ſame word," ſays Mr. Tooke, in the Second Part of his Diverſions of Purley, "is *not* ſometimes an adjective and ſometimes a ſubſtantive. But it is true that ſome languages have ſuch defects, that, for want of an adjective diſtinction to ſome of their terms, they are forced to attribute the term itſelf without any adherent intimation of its attribution. Which defect, viz. the want of an *adjective* termination, was, I ſuppoſe, originally the caſe with all terms in the rude ſtate of all languages: and this defect ſtill continues moſt in the moſt imperfect and unimproved languages. The want of an *adjective* termination to the ſigns of ideas, is more eaſily borne in languages where the *added* ſign is cloſely joined to the ſign which it is intended to accompany. But, without an *adjective* termination, all tranſpoſition would be excluded: and therefore the tranſpoſed languages are never ſo deficient in this reſpect as the others. In Engliſh, inſtead of *adjectiving* our own ſubſtantives, we have borrowed, in immenſe numbers, *adjectived* ſigns from other languages; without borrowing the *unadjectived* ſigns of thoſe ſame ideas: becauſe our authors frequently found they had occaſion for the former, but not for the latter: and, not underſtanding the nature of language, or the nature of the very benefit they were receiving; they did not, as they might and ſhould have done, improve their own language by the ſame contrivance within itſelf; but borrowed from other languages abbreviations ready made to their hands. Thus, while the ſubſtantives are Engliſh, as *boy*, *man*, *woman*, *mind*, *birth*, *life*, &c. the adjectives are of foreign origin, as *infantine*, *puerile*, *virile*, *human*, *female*, *feminine*, *mental*, *natal*, *vital*, &c. The adoption of ſuch words as theſe, was indeed a benefit and an improvement of our language; which however would have been much better and more properly obtained by *adjectiving* our own words. For, as the matter now ſtands, when a poor foreigner has learned all the names of things in the Engliſh tongue, he muſt go to other languages for a multitude of the *adjectived* names of the *ſame things*. And even an unlearned native can never underſtand the meaning of one quarter of that which is called his native tongue." Hence the common remark, that we cannot underſtand our own language without firſt learning Latin.

Of VERBS.—Of the whole claſs of words that are called attributive, and indeed of all the parts of ſpeech, the moſt complex by far is the verb. It is chiefly in this part of ſpeech that the ſubtile and profound metaphyſic of language appears; and therefore, in examining the nature and different variations of the verb, there might be room for ample diſcuſſion. But as ſuch grammatical diſcuſſions, when purſued far, become intricate and obſcure, we ſhall avoid dwelling any longer on this ſubject than is abſolutely neceſſary. The verb is ſo far of the ſame nature with the adjective, that it expreſſes, like it, as M. Siret obſerves, an attribute or property of ſome perſon or thing. But it does more than this. For, in all verbs in every language, there are no leſs than three things implied at once; the attribute of ſome ſubſtantive, an affirmation concerning that attribute, and time. Thus, when we ſay "the ſun ſhines;" ſhining is the attribute aſcribed to the ſun; the preſent time is marked; and an affirmation is included, that this property of ſhining belongs at that time to the ſun. The participle *ſhining* is merely an adjective, which denotes an attribute or property, and alſo expreſſes time; but carries no affirmation. The infinitive mood, *to ſhine*, may be called the name of the verb; it carries neither time nor affirmation, but ſimply expreſſes that attribute, action, or ſtate of things, which is to be the ſubject of the other moods and tenſes. Hence the infinitive often carries the reſemblance of a ſubſtantive noun; and, both in Engliſh and Latin, is ſometimes conſtructed as ſuch. As, *Scire tuum nihil eſt*; *Dulce et decorum eſt pro patria mori*. And, in Engliſh, in the ſame manner: "To write well is difficult; to ſpeak eloquently is ſtill more difficult." But as through all the other tenſes and moods the affirmation runs, and is eſſential to them; "The ſun ſhines, was ſhining, ſhone, will ſhine, would have ſhone, &c. the affirmation ſeems to be that which chiefly diſtinguiſhes the verb from the other parts of ſpeech, and give it its moſt conſpicuous power. Hence there can be no ſentence or complete propoſition, without a verb either expreſſed or implied. For, whenever we ſpeak, we always mean to aſſert that ſomething is, or is not; and the word which carries this aſſertion or affirmation, is a verb. From this ſort of eminence belonging to it, this part of ſpeech hath received its name, verb, from the Latin *verbum*, or 'the word,' by way of diſtinction.

Verbs, therefore, from their importance and neceſſity in ſpeech, muſt have been coeval with men's firſt attempts towards the formation of language: though, indeed, it muſt have been the work of long time to rear them up to that accurate and complex ſtructure which they now poſſeſs. It ſeems very probable, as Dr. Smith hath ſuggeſted, that the radical verb, or the firſt form

of it, in moſt languages, would be what we now call the *imperſonal verb*; "It rains; it thunders; it is light; it is agreeable;" and the like; as this is the very ſimpleſt form of the verb, and merely affirms the exiſtence of an event, or of a ſtate of things. By degrees, after pronouns were invented, ſuch verbs became perſonal, and were branched out into all the variety of tenſes and moods.

The *tenſes* of the verb are contrived to imply the ſeveral diſtinctions of time. Of theſe we muſt take ſome notice, in order to ſhow the admirable accuracy with which language is conſtructed. We think commonly of no more than the three great diviſions of time, into the *paſt*, the *preſent*, and the *future*: and we might imagine, that if verbs had been ſo contrived as ſimply to expreſs theſe, no more was needful. But language proceeds with much greater ſubtilty. It ſplits time into its ſeveral moments. It conſiders time as never ſtanding ſtill, but always flowing; things paſt, as more or leſs perfectly completed; and things future, as more or leſs remote, by different gradations. Hence the great variety of tenſes.

The *preſent* may indeed be always conſidered as one indiviſible point, ſuſceptible of no variety. "I write, or I am writing;" *ſcribo*. But it is not ſo with the *paſt*: there is no language ſo poor, but it hath two or three tenſes to expreſs the varieties of it. Ours hath no fewer than four. 1. A paſt action may be conſidered as left unfiniſhed; which makes the imperfect tenſe, "I was writing;" *ſcribebam* 2. As juſt now finiſhed: this makes the proper perfect tenſe, which in Engliſh is always expreſſed by the help of the auxiliary verb, "I have written." 3. It may be conſidered as finiſhed ſome time ago; the particular time left indefinite: "I wrote; *ſcripſi*; which may either ſignify, I wrote yeſterday, or I wrote a twelvemonth ago." This is what grammarians call an *aöriſt*, or indefinite paſt. 4. It may be conſidered as finiſhed before ſomething elſe, which is alſo paſt. This is the pluſquamperfect: "I had written; *ſcripſeram*: I had written before I received his letter." Here we obſerve, with ſome pleaſure, that we have an advantage over the Latins, who have only three varieties upon the paſt time. They have no proper perfect tenſe, or one which diſtinguiſhes an action juſt now finiſhed from an action that was finiſhed ſome time ago. In both theſe caſes they muſt ſay *ſcripſi*, though there be a manifeſt difference in the tenſes which our language expreſſes by this variation, "I have written," meaning, I have juſt now finiſhed writing; and "I wrote," meaning at ſome former time, ſince which other things have intervened. This difference the Romans have no tenſe to expreſs; and therefore can only do it by a circumlocution. The chief varieties in the *future* time are two. A ſimple or indefinite future; "I ſhall write;" *ſcribam*: and a future relating to ſomething elſe which is alſo future; "I ſhall have written;" *ſcripſero*; I ſhall have written before he arrives. On the tenſes of verbs, Mr. Harris's Hermes may be conſulted by ſuch as deſire to ſee them ſcrutinized with metaphyſical accuracy; and alſo, the Treatiſe on the Origin and Progreſs of Language, vol. ii. p. 125.

Beſides tenſes, or the power of expreſſing time, verbs admit the diſtinction of *voices* as they are called, the *active* and the *paſſive*; according as the affirmation reſpects ſomething that is done, or ſomething that is ſuffered; "I love," or "I am loved." *Neuter verbs* may be known by this, that a paſſive verb cannot be formed from them, as from a verb active. Verbs admit alſo the diſtinction of *moods*, which are deſigned to expreſs the affirmation, whether active or paſſive, under different forms. The *indicative mood*, for inſtance, ſimply declares a propoſition, "I write; I have written;" the *imperative* requires, commands, threatens: "Write thou; let him write." The *ſubjunctive* expreſſes the propoſition under the form of a condition, or in ſubordination to ſome other thing to which a reference is made: "I might write, I could write, I ſhould write, if the caſe were ſo and ſo." This manner of expreſſing an affirmation under ſo many different forms, together alſo with the diſtinction of the three perſons, *I*, *thou*, and *he*, conſtitutes what is called the *conjugation* of verbs, which makes ſo great a part of the grammar of all languages.

It now clearly appears, as before obſerved, that of all the parts of ſpeech, verbs are by far the moſt artificial and complex. Conſider only, how many things are denoted by this ſingle Latin word, *amaviſſem*, "I would have loved." Firſt, The perſon who ſpeaks, "I." Secondly, An attribute or action of that perſon, "loving." Thirdly, An affirmation concerning that action. Fourthly, The paſt time denoted in that affirmation, "have loved." Fifthly, A condition on which the action is ſuſpended, "*would* have loved." It appears curious and remarkable, that words of this complex import, and with more or leſs of this artificial ſtructure, are to be found, as far as we know, in all languages of the world. Indeed, the form of *conjugation*, or the manner of expreſſing all theſe varieties in the verb, differs greatly in different tongues. Conjugation is eſteemed moſt perfect in thoſe languages which, by varying either the termination or the initial ſyllable of the verb, expreſs the greateſt number of important circumſtances without the help of auxiliary words. In the oriental tongues, the verbs are ſaid to have few tenſes or expreſſions of time; but then their moods are ſo contrived as to expreſs a great variety of circumſtances and relations. In the Hebrew for inſtance, they ſay, in one word, without the help of any auxiliary, not only "I have taught," but, "I have taught exactly, or often; I have been commanded to teach; I have taught myſelf." The Greek, which is the moſt perfect of all the known tongues, is very regular and complete in all the tenſes and moods. The Latin is formed on the ſame model, but more imperfect; eſpecially in the paſſive voice, which forms moſt of the tenſes by the help of the auxiliary *ſum*, I am.

In all the modern European tongues, conjugation is very defective. They admit few varieties in the termination of the verb itſelf; but have almoſt conſtant recourſe to their auxiliary verbs throughout all the moods and tenſes, both active and paſſive. Language has undergone a change in conjugation perfectly ſimilar to that which it underwent with reſpect to declenſion. As prepoſitions prefixed to the noun ſuperſeded the uſe of caſes; ſo the two great auxiliary verbs, *to have*, and *to be*, with thoſe other auxiliaries which we uſe in Engliſh, *do*, *ſhall*, *will*, *may*, and *can*, prefixed to the participle, ſuperſede in a great meaſure the different terminations of moods and tenſes which formed the ancient conjugations. The alteration, in both caſes, was owing to the ſame cauſe, and will be eaſily underſtood, from reflecting on what was formerly obſerved.

Auxiliary verbs are, like prepoſitions, words of a very general and abſtract nature. They imply the different modifications of ſimple exiſtence conſidered alone, and without reference to any particular thing. In the early ſtate of ſpeech, the import of them would be incorporated with every particular verb in its tenſes and moods, long before words were invented for denoting ſuch abſtract conceptions of exiſtence, alone and by themſelves. But after thoſe auxiliary verbs came, in the progreſs of language, to be invented and known, and to have tenſes and moods given to them like other verbs; it was found that, as they carried in their nature the force of that affirmation which diſtinguiſhes the verb, they might, by being joined with the participle which gives the meaning of the verb, ſupply the place of moſt of the moods and tenſes. Hence, as the modern tongues began to riſe out of the ruins of the ancient, this method eſtabliſhed itſelf in the new formation of ſpeech. Such words, for inſtance, as *am*, *was*, *have*, *ſhall*, being once familiar, it

appeared more eaſy to apply theſe to any verb whatever; as, "I am loved; I was loved; I have loved;" than to remember that variety of terminations which were requiſite in conjugating the ancient verbs, *amor*, *amabar*, *amavi*, &c. Two or three varieties only in the termination of the verb were retained, as, *love*, *loved*, *loving*; and all the reſt were dropped. The conſequence however of this practice, was the ſame as that of abolifhing declenſions. It rendered language more ſimple and eaſy in its ſtructure; but withal more prolix and leſs graceful. The uſe of auxiliary verbs in the conjugations of the Italian, Spaniſh, and French, languages, ſeems to have been borrowed from the German, ſince their mother-tongue, the Latin, makes no uſe of them but in the compound tenſes of the paſſive voice.

PARTICIPLES are in our grammars made a ſeparate part of ſpeech, though evidently a part of the verb, while adjectives are confounded with nouns, to which they have no relation whatever. They are two in number; the participle of the *preſent*, and the participle of the *paſt*; *loving*, *loved*; *learning*, *learned*. They are called *participles* becauſe they *partake* of the nature of the verb. *Loving*, *learning*, may be applied to perſons, as may *loved*, *learned*, the former implying the actual exiſtence of the quality in the perſon at the time ſpoken of; the latter that the quality had exiſted in the perſon. *He is learning French*, or *he has been learning French for ſome time paſt*. The preſent tenſe of the Engliſh language being rather an indefinite tenſe, this participle is alſo indefinite: *learning* in both of the above inſtances ſhowing that the quality was exiſting in the man for an indefinite time. In the ſentences, "he is loved," or, "he has been loved," the participle *loved* ſhows that the quality had exiſted in the man at a former period; "he has been loved," namely, at a diſtant time; "he is loved," implies that the perſon at the preſent time is one who had love, and no intimation being given that the love of him ceaſed to exiſt, it naturally follows that we preſume he will continue to be beloved. In all languages the participle has thus the circumſtance of *time* attending the quality expreſſed, which may belong to a perſon; and in this chiefly it differs from the adjective.

ADVERBS form a very numerous claſs of words in every language, reducible in general to the head of attributives; as they ſerve to modify or to denote ſome circumſtance of an action or of a quality, relative to its time, place, order, degree, and the other properties of it which we have occaſion to ſpecify. They are for the moſt part no more than an abridged mode of ſpeech, expreſſing by one word what might by a circumlocution be reſolved into two or more words belonging to the other parts of ſpeech. *Exceedingly*, for inſtance, is the ſame as "in a high degree;" *bravely*, the ſame as "with bravery or valour;" *here*, the ſame as "in this place;" *often*, and *ſeldom*, the ſame as "for many, and for few, times:" and ſo of the reſt. Hence, adverbs may be conceived as of leſs neceſſity, and of later introduction into the ſyſtem of ſpeech, than many other claſſes of words; and accordingly the great body of them are derived from other words formerly eſtabliſhed in the language.

PREPOSITIONS and CONJUNCTIONS, are words more eſſential to diſcourſe than the greateſt part of adverbs. They form that claſs of words called *connectives*, without which there could be no language; ſerving to expreſs the relations which things bear to one another, their mutual influence, dependencies, and coherence; thereby joining words together into intelligible and ſignificant propoſitions.

CONJUNCTIONS are defined as words which are to "connect words, either two or more words in a ſentence, or to make of two ſimple ſentences one compound ſentence." This is the general account: but unfortunately we ſtumble at the next ſtep without having enquired after any of theſe words; for theſe conjunctions are immediately after divided into two claſſes, the one called *connective*, and the other *disjunctive*; that is, one claſs of theſe connecting words, inſtead of connecting, disjoin: and hence ariſes an abſurdity. There are certain words in all languages, which by frequent repetition have loſt their original form, and their meaning is not obvious. Such are the words *if*, *and*, *becauſe*, *or*. From their meaning not being known, ſome writers have ſuppoſed them to have no meaning at all, and that they were mere ſounds to connect or disjoin, were continuative, ſubcontinuative, collective, &c. But Mr. Horne Tooke has ſhown, that many of theſe words are the imperatives of old Saxon verbs; and the Hebrew language is a confirmation of his theory. We ſhall ſubjoin his table:

The Engliſh Conjunctions	Are the Imperatives	Of their reſpective Saxon Verbs,	
if	*gif*	*gifan*	to give
an	*an*	*anan*	to grant
unleſs	*onles*	*onlefan*	to diſmiſs
eke	*cac*	*eacan*	to add
yet	*get*	*getan*	to get
ſtill	*ſtell*	*ſtellan*	to put
elſe	*ales*	*alefan*	to diminiſh
though or	*thafig* or	*thafigan* or	to allow
tho'	*thaf*	*thafian*	
but	*bot*	*botan*	to boot; to ſuperadd
but	*be-utan*	*beon-utan*	to be out
without	*wyrth-utan*	*wyrthan-utan*	to be out
and	*an-ad*	*anan-ad*	dare con-geriem

leſt is the participle *leſed* of *leſan*, to diſmiſs.

Since { *ſiththan*, *ſine*, *ſeandes*, *ſiththe* or *ſin-es* } is the participle of *ſeon*, to ſee.

That is the Saxon article or pronoun ðat. *As* is *es*, a German article, meaning *it*, *that*, or *which*. And *ſo* is *ſa* or *ſo*, a Gothic article of the ſame import with *as*.

From conſidering the above ſynopſis, and referring to a ſimilar derivation in other languages, we have reaſon to believe that there is no ſuch ſeparate claſs as conjunctions, or words without meaning, to connect and diſjoin, but that the connection or disjunction is to be found in the meaning of the word. See ETYMOLOGY, vol. vii. p. 44.

If we are right in our opinion with reſpect to conjunctions, we ſhall naturally be little inclined to admit PREPOSITIONS as another claſs of words without meaning themſelves, but merely intended "to unite two words of meaning together, which without this aſſiſtance could not coaleſce." We ſhall look to derivation for the meaning of theſe words; and if we have any grounds for giving them a meaning, we ſhall claſs them accordingly. Let us try then with the ſuppoſed prepoſitions, *with*, *without*, *chez*, χωρις, *ſonder*.

With means, in all caſes where it is employed, addition; *without*, the contrary. "The king of England, *with* the lords and commons, can make a law: *without* the lords and commons, cannot make a law." Join the lords and commons to the king, and his act is good: take them away, and in law making he becomes a cipher. There is an Anglo-Saxon verb, *withan*, whoſe imperative is *with*; this imperative, we ſay, remains in uſe in what is called the prepoſition *with*; the other parts of the verb are obſolete. *Without* comes from the Saxon *wyrthan-utan*, be out. Thus in French *avec*, correſponding to our *with*, is from the imperative of *avoir* and the adjective *ce*, have that. *Chez* is called a prepoſition in French; but it is in reality a corruption of *caſa*, a houſe; *chez moi*, at my houſe. χωρις may very reaſonably

ſonably be referred to χορίζω, when *ſonder* of the Germans, of ſimilar import, ſeems to have the ſame relationſhip to *ſondern*, the verb.

Thorough, *thourough*, *thorow*, *through*, or *thro'*, is no other, ſays Horne Tooke, than the Gothic ſubſtantive *dauro*, or the Teutonic ſubſtantive *thuruh*, and, like them, means *door*, *gate*, *paſſage*. So that the ſentence cited by him, reſolved upon his principles, ſtands thus: "The ſplendid ſun—*join* his beams—genially warmeth—*paſſage* the air, (or, the air being the *paſſage* or *medium*)—the fertile earth." And in the ſame manner may we tranſlate the prepoſition *through* in every inſtance where *through* is uſed in Engliſh, or its equivalent prepoſition in any language; as from the Latin and Italian word *porta* (in Spaniſh *puerta* and in French *porte*), have come the Latin and Italian prepoſition *per*, the French *par*, and the Spaniſh *por*.

Up, *upon*, *over*, *bove*, *above*, have all, ſays the ſame philologiſt, one common origin and ſignification. In the Anglo-Saxon, *ufa*, *ufera*, *ufemæſt*, are the adjectives *altus*, *altior*, *altiſſimus*. *Ufa* or *ufan*, up; comparative *ufera*, *ofere* or *ofer*, over or upper; ſuperlative *ufemæſt*, upmoſt or uppermoſt. *Beufan*, *bufan*, *on-bufan*, bove, above.—If this be a juſt account of the origin of theſe words, the ſentences where *upon*, *over*, and *above*, occur, will run thus: "The ſtatue ſtood *on high* a pedeſtal;" "The river ran *higher* a ſand;" "The ſun is riſen *on high* the hills." And here we may obſerve, that the mere relation between ſtanding, running, &c. and place, is rather inferred from the verb itſelf than expreſſed by a ſeparated word; and the reaſon is obvious. For if a ſtatue ſtand, every one knows that it muſt ſtand *on* ſome thing as well as *at* ſome time. There is therefore no neceſſity, whatever elegance there may be in it, for employing any word to denote that relation, which is commonly believed to be ſignified by *on*; but it is neceſſary to inſert, between the verb and pedeſtal, a word ſignificant of *place*, that *pedeſtal* may not be miſtaken by an ignorant perſon for a *portion of time*, or any thing elſe connected with the ſtanding of the ſtatue.

Our very beſt writers are extremely incorrect in the uſe of the prepoſition. Few names ſtand higher in our language than thoſe of Swift, Dryden, Bentley, Bolingbroke, Pope, and Addiſon. We might therefore reaſonably expect that the writings of theſe eminent men would afford a ſtandard of propriety. Swift wrote upon the ſubject of the Engliſh tongue, and was remarkably attentive to grammatical preciſion. Dryden was the firſt poet, Engliſh critic, and proſe-writer, of his time. Bentley's literary character was well-known through Europe. Bolingbroke and Pope were both very elegant, and generally very correct, writers. And Johnſon concludes Addiſon's Life with ſaying, that "whoever wiſhes to attain an Engliſh ſtyle, muſt give his days and nights to the volumes of Addiſon." But yet theſe authorities, though claſſical, might lead a writer into many groſs errors; for they are all guilty of faults, or rather of anomalies. The inaccuracies moſtly noticed are in the uſe of the prepoſition. Swift writes: "Value themſelves *by* drawing your character;—beſtow favour *to* the moſt deſerving;—fell *into* their cognizance;—factions *into* which we are engaged." Dryden: "Reſtore *into* the good graces;—accuſed *for* luxuriancy;—may congratulate *to* themſelves." Bolingbroke: "Reproached *to* Tacitus;—ſwerve *out* of the path." Bentley: "Reſolved *of* going;—made much *on*." Addiſon: "Policy prevail'd *upon* force;—diſſent *with* the examiner." Pope: "And virgins ſmil'd at what they bluſh'd [at] before."

At length biſhop Louth gives one rule upon the ſubject reſpecting the government of nouns, viz. that nouns generally require after them the ſame prepoſition as the verb from which they are formed. We exceedingly lament that he did not give us a chapter upon the uſe of the prepoſition after the verb itſelf.

If it be ſaid that theſe errors might have been avoided, we aſk, through what means? Had theſe authors ever been told, that the prepoſitions they thus made uſe of were improper? or had it ever been ſettled, that the regimen of ſuch words as were naturalized ſhould follow that of the parent language? It may be ſaid, that we are not likely again to fall into the *ſame* errors, becauſe the biſhop has pointed out the impropriety. But it would not be difficult to quote from living authors, of great ability and claſſical education, inaccuracies as groſs as thoſe mentioned in the biſhop's note, which, we conceive, can ariſe only from the want of ſome rule or ſtandard of acknowledged authority. We ſhall venture to notice a few expreſſions which appear incorrect, in Johnſon, Harris, and others of the ſame date: "Turned their thoughts *upon* the modes of virtue;—Johnſon expatiates freely *into* whatever is collateral;—ſatisfied *in* the works." *Preface to the Hermes*. "Cenſured *of* vanity." *Shenſtone*. "Contraſted *to*." *Warton*. "Compliance *to*." *More*. "Congenial *to*;—antipathy *at*;—eloquent *of*." *Mackenzie*. Theſe writers are of conſiderable authority; and the expreſſions are taken from ſhort eſſays, a ſpecies of literary production in which perſpicuity, accuracy, and expreſſion, are more particularly attended to.

We have now only to ſpeak of the INTERJECTION. The genuine interjections are very few in number, and of very little importance, as they are thrown into a ſentence without altering its form either in ſyntax or ſignification. In the words of Horne Tooke, "The brutiſh *inarticulate* interjection has nothing to do with ſpeech, and is only the miſerable refuge of the ſpeechleſs. The dominion of ſpeech (according to the ſame author) is erected on the downfal of interjections. Without the artful contrivances of language, mankind would have nothing but interjections with which to communicate orally any of their feelings. The neighing of a horſe, the lowing of a cow, the barking of a dog, the purring of a cat, ſneezing, coughing, groaning, ſhrieking, and every other involuntary convulſion with oral ſound, have almoſt as good a title to be called parts of ſpeech as interjections. In the intercourſe of language, interjections are employed only when the ſuddenneſs or vehemence of ſome affection or paſſion returns men to their natural ſtate, and makes them for a moment forget the uſe of ſpeech; or when, from ſome circumſtance, the ſhortneſs of time will not permit them to exerciſe it." The genuine interjection, which is always expreſſive of ſome very ſtrong ſenſation, ſuch as *Ah!* when we feel pain, does not owe its characteriſtical expreſſion to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and geſture. Of conſequence, theſe tones and geſtures expreſs the ſame meaning, without any relation to the articulation which they may aſſume; and are therefore univerſally underſtood by all mankind. Voluntary interjections are uſed in books only for embelliſhment, and to mark forcibly a ſtrong emotion. But where ſpeech can be employed, they are totally uſeleſs; and are always inſufficient for the purpoſe of communicating thought. Dr. Beattie ranks *ſtrange*, *prodigious*, *amazing*, *wonderful*, *O dear*, *dear me*, &c. when uſed alone and without apparent grammatical ſyntax, among the interjections: but he might with as much propriety have conſidered *hardly*, *truly*, *really*, and even many Latin verbs, as interjections; for theſe too are often uſed alone to ſupply the place of whole ſentences. The truth is, that all men, when ſuddenly and violently agitated, have a ſtrong tendency to ſhorten their diſcourſe by employing a ſingle word to expreſs a ſentiment. In ſuch caſes, the word employed, whether noun, adjective, or verb, would be the principal word of the ſentence, if that ſentence were completed; and the agitation of the ſpeaker is ſuch, and the cauſe of it ſo obvious, that the hearer is in no danger of miſtaking

the

the ſenſe, and can himſelf ſupply the words that are wanting. Thus if a perſon, after liſtening to a romantic narrative, were to exclaim, *ſtrange!* would any man of common ſenſe ſuppoſe that the word *ſtrange*, becauſe uttered alone, had loſt the power of an *adjective* and become an *interjection?* No, ſurely: every one ſees that the exclamation is equivalent to, *that is ſtrange*, or, *that is a ſtrange ſtory*. Real interjections are never employed to convey truth of any kind. They are not to be found amongſt laws, in books of civil inſtitution, in hiſtory, or in any treatiſe of uſeful arts or ſciences; but in rhetoric and poetry, in novels, plays, and romances, where in Engliſh, ſo far from giving pathos to the ſtyle, they have generally an effect that is diſguſting or ridiculous.

Of DERIVATION.

Upon ETYMOLOGY in general we have ſpoken in the preceding volume, p. 44. But it may be proper to add ſomething relative to the derivation of Engliſh words.

Though there is little doubt but nouns were the firſt words invented and uſed, yet in the preſent ſtate of language we generally find the noun to be derived from the verb.—The thing implied in the verb, as done or produced, is commonly either the preſent of the verb; as to love, *love*; to fright, a *fright*; to fight, a *fight*; or the preterite of the verb, as, to ſtrike, I ſtrick *or* ſtrook, a *ſtroke*. The action is the ſame with the participle preſent, as, *loving*, *frighting*, *fighting*, *ſtriking*. The agent, or perſon acting, is denoted by the ſyllable *er* added to the verb, as, *lover*, *frighter*, *ſtriker*. Subſtantives, adjectives, and ſometimes other parts of ſpeech, are changed into verbs; in which caſe the vowel is often lengthened, or the conſonant ſoftened; as, a houſe, *to houſe*; braſs, *to braze*; glaſs, *to glaze*; graſs, *to graze*; price, *to prize*; breath, *to breathe*; a fiſh, *to fiſh*; oil, *to oil*; further, *to further*; forward, *to forward*; hinder, *to hinder*. Sometimes the termination *en* is added, eſpecially to adjectives: as, haſte, *to haſten*; length, *to lengthen*; ſtrength, *to ſtrengthen*; ſhort, *to ſhorten*; faſt, *to faſten*; white, *to whiten*; black, *to blacken*; hard, *to harden*; ſoft, *to ſoften*.

From ſubſtantives are formed adjectives of plenty, by adding the termination *y*; as, wealth, *wealthy*; health, *healthy*; might, *mighty*; worth, *worthy*; wit, *witty*; luſt, *luſty*; water, *watery*; earth, *earthy*; wood, a wood, *woody*; air, *airy*; a heart, *hearty*; a hand, *handy*. Or, by adding the termination *ful*, denoting abundance; as joy, *joyful*; fruit, *fruitful*; youth, *youthful*; care, *careful*; uſe, *uſeful*; delight, *delightful*; plenty, *plentiful*; help, *helpful*. Sometimes, in almoſt the ſame ſenſe, but with ſome kind of diminution thereof, the termination *ſome* is added, denoting *ſomething*, or *in ſome degree*; as delight, *delightſome*; game, *gameſome*; irk, *irkſome*; burden, *burdenſome*; trouble, *troubleſome*; light, *lightſome*; hand, *handſome*; alone, *loneſome*; toil, *toilſome*.

On the contrary, the termination *leſs* added to ſubſtantives, makes adjectives ſignifying want; as, *worthleſs*, *witleſs*, *heartleſs*, *joyleſs*, *careleſs*, *helpleſs*. Thus, comfort, *comfortleſs*; ſap, *ſapleſs*. Privation or contrariety is very often denoted by the particle *un* prefixed to many adjectives, or *in* before words derived from the Latin; as, pleaſant, *unpleaſant*; wiſe, *unwiſe*; profitable, *unprofitable*; patient, *impatient*. Thus, *unworthy*, *unhealthy*, *unfruitful*, *unuſeful*, and many more.

The original Engliſh privative is *un*; but as we often borrow from the Latin, or its deſcendants, words already ſignifying privation, as, *inefficacious*, *impious*, *indiſcreet*, the inſeparable particles *un* and *in* have fallen into confuſion from which it is not eaſy to diſentangle them. *Un* is prefixed to all words originally Engliſh; as, *untrue*, *untruth*, *untaught*, *unhandſome*. *Un* is prefixed to all participles made privative adjectives; as, *unfeeling*, *unaſſiſting*, *unpleaſing*, *unaided*, *undelighted*, *unendeared*. *Un* ought never to be prefixed to a participle preſent, to mark a forbearance of action, as *unſighing*; but a privation of habit, as, *unpitying*. *Un* is prefixed to moſt ſubſtantives which have an Engliſh termination, as, *unfertileneſs*, *unperfectneſs*, which, if they have borrowed terminations, take *in* or *im*, as, *infertility*, *imperfection*; *uncivil*, *incivility*; *unactive*, *inactivity*. In borrowing adjectives, if we receive them already compounded, it is uſual to retain the particle prefixed; as, *indecent*, *inelegant*, *improper*; but if we borrow the adjective, and add the privative particle, we commonly prefix *un*, as, *unpolite*, *ungallant*.

The prepoſitive particles *dis* and *mis*, derived from the *des* and *mes* of the French, ſignify almoſt the ſame as *un*; yet *dis* rather imports contrariety than privation, ſince it anſwers to the Latin prepoſition *de*. *Mis* inſinuates ſome error, and for the moſt part may be rendered by the Latin words *male* or *perperam*. To like, *to diſlike*; honour, *diſhonour*; to honour, to grace, *to diſhonour*, *to diſgrace*; to deign, *to diſdeign*; chance, hap, *miſchance*, *miſhap*; to take, *to miſtake*; deed, *miſdeed*; to uſe, *to miſuſe*; to employ, *to miſemploy*; to apply, *to miſapply*. Words derived from Latin written with *de* or *dis* retain the ſame ſignification; as, *diſtinguiſh*, diſtinguo; *detract*, detraho; *defame*, defamo; *detain*, detineo.

The termination *ly* added to ſubſtantives, and ſometimes to adjectives, forms adjectives that import ſome kind of ſimilitude or agreement, being formed by contraction of *lic* or *like*. A giant, *giantly*, *gianthike*; earth, *earthly*; heaven, *heavenly*; world, *worldly*; God, *godly*; good, *goodly*. The ſame termination *ly* added to adjectives, forms adverbs of like ſignification; as, beautiful, *beautifully*; ſweet, *ſweetly*; that is, *in a beautiful manner*; *with ſome degree of ſweetneſs*. The termination *iſh* added to adjectives, imports diminution; and added to ſubſtantives, imports ſimilitude or tendency to a character; as, green, *greeniſh*; white, *whitiſh*; ſoft, *ſoftiſh*; a thief, *thieviſh*; a wolf, *wolviſh*; a child, *childiſh*. We have forms of diminutives in ſubſtantives, though not frequent; as, a hill, *a hillock*; a cock, *a cockrel*; a pike, *a pickrel*, this is a French termination; a gooſe, *a goſling*, this is a German termination; a lamb, *a lambkin*; a chick, *a chicken*; a man, *a manikin*; a pipe, *a pipkin*; and thus *Halkin*, whence the patronimic, *Hawkins*, *Wilkins*, *Tomkins*, and others.

Of concrete adjectives are made abſtract ſubſtantives, by adding the termination *neſs*, and a few in *hood* or *head*, noting character or qualities; as, white, *whiteneſs*; hard, *hardneſs*; great, *greatneſs*; ſkilful, *ſkilfulneſs*, *unſkilfulneſs*; *godhead*, *manhood*, *maidenhead*, *widowhood*, *knighthood*, *prieſthood*, *likelihood*, *falſehood*. There are other abſtracts, partly derived from adjectives and partly from verbs, which are formed by the addition of the termination *th*, a ſmall change being ſometimes made; as, long, *length*; ſtrong, *ſtrength*; broad, *breadth*; wide, *width*; deep, *depth*; true, *truth*; warm, *warmth*; dear, *dearth*; ſlow, *ſlowth*; merry, *mirth*; heal, *health*; well, weal, *wealth*; dry, *droughth*; young, *youth*; and ſo moon, *month*.

Like theſe are ſome words derived from verbs; die, *death*; till, *tilth*; grow, *growth*; mow, later-*mow'th*, after-*mow'th*; commonly ſpoken and written later-*math*, after-*math*; ſteal, *ſtealth*; bear, *birth*; rue, *ruth*; and probably *earth* from *to ear* or *plow*; fly, *flight*; weigh, *weight*; fray, *fright*; to draw, *draught*.

We have many words borrowed from the Latin; but the greateſt part of them were communicated by the intervention of the French; as, *grace*, *face*, *elegant*, *elegance*, *reſemble*. Some verbs, which ſeem borrowed from the Latin, are formed from the preſent tenſe, and ſome from the ſupine. From the preſent are formed *ſpend*, *expend*, expendo; *conduce*, conduco; *deſpiſe*, deſpicio; *approve*, approbo; *conceive*, concipio. From the ſupines, *ſupplicate*, ſupplico; *demonſtrate*, demonſtro; *diſpoſe*, diſpono; *expatiate*, expatior; *ſuppreſs*, ſupprimo; *exempt*, eximo.

Some words purely French, not derived from the Latin, we have transferred into our language; as, *gar-*

den,

den, *garter*, *buckler*, *to advance*, *to cry*, *to plead*, from the French *jardin*, *jartier*, *boucher*, *avancer*, *crier*, *plaider*; though indeed even of theſe part is of Latin original.

As to many words which we have in common with the Germans, it is doubtful whether the old Teutons borrowed them from the Latins, or the Latins from the Teutons, or both had them from ſome common original: as, *wine*, vinum; *wind*, ventus; *went*, veni; *way*, via; *wall*, vallum; *wallow*, volvo; *wool*, vellus; *will*, volo; *worm*, vermis; *worth*, virtus; *waſp*, veſpa; *day*, dies; *draw*, traho; *tame*, domo, δαμαω; *yoke*, jugum, ζευγος; *over*, *upper*, ſuper, υπερ; *am*, ſum, ειμι; *break*, frango; *fly*, volo; *blow*, flo.

Our anceſtors were ſtudious to form borrowed words, however long, into monoſyllables; and not only cut off the formative terminations, but cropped the firſt ſyllable, eſpecially in words beginning with a vowel; and rejected not only vowels in the middle, but likewiſe conſonants of a weaker ſound, retaining the ſtronger, which ſeem the bones of words, or changing them for others of the ſame organ, in order that the ſound might become the ſofter; but eſpecially tranſpoſing their order, that they might the more readily be pronounced without the intermediate vowels. For example, in expendo, *ſpend*; exemplum, *ſample*; excipio, *ſcape*; extraneus, *ſtrange*; extractum, *ſtretched*; excrucio, *to ſcrew*; exſcorio, *to ſcour*; excorio, *to ſcourge*; excortico, *to ſcratch*; and others beginning with *ex*: as alſo, emendo, *to mend*; epiſcopus, *biſhop*, in Daniſh *biſp*; epiſtola, *epiſtle*; hoſpitale, *ſpittle*; Hiſpania, *Spain*; hiſtoria, *ſtory*.

The ſame word, according to its different ſignifications, often has a different origin; as, *to bear a burden*, from *fero*; but *to bear*, whence *birth*, *born*, *bairn*, comes from *pario*; and *a bear*, at leaſt if it be of Latin original, from *fera*. Thus *perch*, a fiſh, from *perca*; but *perch*, a meaſure, from *pertica*, and likewiſe *to perch*. *To ſpell*, is from *ſyllaba*; but *ſpell*, an inchantment, by which it is believed that the boundaries are ſo fixed in lands that none can paſs them againſt the maſter's will, from *expello*; and *ſpell*, a meſſenger, from *epiſtola*; whence *goſpel*, *good-ſpell*, or *god-ſpell*. Thus *freeſe* or *freeze*, from *frigeſco*; but *frieze*, an architectonic word, from *zophorus*; and *freeſe*, for *cloth*, from *Friſia*, or perhaps from *frigeſco*, as being more fit than any other for keeping out the cold.

There are many words among us, even monoſyllables, compounded of two or more words, at leaſt ſerving inſtead of compounds, and compriſing the ſignification of more words than one; as from *ſcript* and *roll*, comes *ſcroll*; from *proud* and *dance*, *prance*; from *ſt* of the verb *ſtay* or *ſtand*, and *out*, is made *ſtout*; from *ſtout* and *hardy*, *ſturdy*; from *ſp* of *ſpit* or *ſpew*, and *out*, comes *ſpout*; from the ſame *ſp*, with the termination *in*, is *ſpin*; and adding *out*, *ſpin out*; and from the ſame *ſp*, with *it*, is *ſpit*, which only differs from *ſpout* in that it is ſmaller, and with leſs noiſe and force; but *ſputter* is, becauſe of the obſcure *u*, ſomething between *ſpit* and *ſpout*; and by reaſon of adding *r*, it intimates a frequent iteration and noiſe, but obſcurely confuſed; whereas *ſpatter*, on account of the ſharper and clearer vowel *a*, intimates a more diſtinct noiſe, in which it chiefly differs from *ſputter*. From the ſame *ſp*, and the termination *ark*, comes *ſpark*, ſignifying a ſingle emiſſion of fire with a noiſe; namely, *ſp* the emiſſion, *ar* the more acute noiſe, and *k* the mute conſonant, intimates its being ſuddenly terminated; but adding *l*, is made the frequentative *ſparkle*. The ſame *ſp*, by adding *r*, that is *ſpr*, implies a more lively impetus of diffuſing or expanding itſelf; to which adding the termination *ing*, it becomes *ſpring*; its vigour *ſpr* imports, its ſharpneſs the termination *ing*; and laſtly *in* acute and tremulous, ending in the mute conſonant *g*, denotes the ſudden ending of any motion, that it is meant in its primary ſignification of a ſingle, not a complicated, exilition. Hence we call *ſpring* whatever has an elaſtic force; as alſo a fountain of water, and thence the origin of any thing; and *to ſpring*, to germinate; and *ſpring*, one of the four ſeaſons. From the ſame *ſpr* and *out*, is formed *ſprout*, and with the termination *ig*, *ſprig*; of which the following, for the moſt part, is the difference: *ſprout*, of a groſſer ſound, imports a fatter or groſſer bud; *ſprig*, of a ſlenderer ſound, denotes a ſmaller ſhoot. In like manner, from *ſtr* of the verb *ſtrive*, and *out*, comes *ſtrout* and *ſtrut*. From the ſame *ſtr* and the termination *uggle*, is made *ſtruggle*; and this *gl* imports, but without any great noiſe, by reaſon of the obſcure ſound of the vowel *u*. In like manner from *throw* and *roll* is made *troll*; and almoſt in the ſame ſenſe is *trundle*, from *throw* or *thruſt*, and *rundle*. Thus *graff* or *grough* is compounded of *grave* and *rough*; and *trudge* from *tread* or *trot*, and *drudge*.

It is for the ſake of preſerving the etymology of words, that people write differently from what they ſpeak: a phenomenon, which indeed has been hitherto repreſented, by grammarians and philoſophic linguiſts, as the moſt palpable abſurdity that can be conceived; although the agreement of all the weſtern nations of Europe, in what they have thus termed abſurdity, ſhould have convinced them, that there muſt be ſome reaſon for it, and which ought not to be overlooked. This reaſon then is no other, than to preſerve, as long as is neceſſary, to the eye at leaſt, the proximate derivation by means of writing, although the pronunciation has loſt it; to promote thereby that univerſal intelligibility, which is the firſt and principal object of language; for, as the pronunciation in all mixed languages, is from time to time conſiderably changed, many words would ſoon become altogether obſcure and unintelligible, did not the etymological way of writing them, ſtill maintain their true form, as long as is practicable and neceſſary. Beſides, the adherence to the neareſt derivation, and the preſervation of the original form of words, by accurate writing, are likewiſe the means of preventing the extremely fluctuating pronunciation from ſtill greater deviations. This is the true reaſon, why all the weſtern Europeans, and conſequently the Engliſh too, write differently from what they ſpeak: and as this phenomenon has been produced entirely by "the latent perception of purpoſe and means," which is involved in ſo much obſcurity, that grammarians have not yet been able to account for it; hence we receive a leſſon, not to cenſure the like regulations, if they are univerſally adopted by one or more nations, until the real foundation of them has been diſcovered. The difference of this mode of writing from that of ſpeaking, is indeed in itſelf an imperfection; but in all thoſe languages, that are ſo thoroughly mixed, it is a real perfection; becauſe it preſerves, at leaſt to the eye, the immediate derivation, and conſtantly furniſhes us with the eaſieſt poſſible method of underſtanding words, while it ſerves to prevent any further deviations in the pronunciation.

Some difference of opinion prevails as to doubling of conſonants in various words. As to the final *k* after *c*, it is now generally omitted; and it is ſingular enough that C, having the very form of an ancient Greek ſigma, ever came to be appropriated to the expreſſion of the ſame ſound as K; but as this is the caſe at preſent, it ſeems to be frequently (and perhaps, from the ſuperior elegance and lightneſs of its ſhape, juſtly) preferred for that purpoſe. Now when the laſt ſyllable is unaccented, only one final conſonant is required; and the *c* is taken: both *c* and *k* being adopted in monoſyllables. In final variations or additions however, beginning with a vowel before which *c* would regularly have the ſound of *s*, *k* is properly interpoſed; as in "phyſicked:" except when *s* is the ſound wanted, as in "phyſician;" and any ſuch reſource being of courſe unneceſſary with thoſe vowels upon which *c* has alone the force of *k*, as in "phyſical." Yet, though *c* may be eligibly preferred to *k* when the matter is indifferent, the uſe of it in "ſceptic" ſeems contrary to all analogy of pronunciation.

In polyſyllables, doubling a conſonant is the effectual

way of throwing the accent upon the preceding; and it is upon this principle that we write "offered" and "referred," "profited" and "omitted." This then appears the ground of diſcrimination; that (generally ſpeaking) an accented ſyllable requires a double, and an unaccented a ſingle, conſonant: a rule which might lead us to differ in ſome inſtances from common uſage, but in none from propriety: it would lead us to write "bridewel, waterfal, dunghil, handful; foretell, miſcall." It would lead us to recall the *d* in alledge and pidgeon; but to leave it out as uſual in college and knowlege. Attention to pronunciation, and to the diviſion of ſyllables, would alone be ſufficient to make the eliſion very improper in "chargeable, manageable," &c. and perſpicuity requires it to be avoided in "ſingeing," the participle of *ſinge*.

Of SYNTAX.

The Engliſh tongue poſſeſſes, undoubtedly, this property, that it is the moſt ſimple in its form and conſtruction of all the European dialects. Its words are ſubject to fewer variations from their original form than thoſe of any other language. Its ſubſtantives have no diſtinction of gender, except what nature has made, and but one variation in caſe. Its adjectives admit of no change at all, except what expreſſes the degree of compariſon. Its verbs, inſtead of running through all the varieties of ancient conjugation, ſuffer no more than four or five changes in termination. By the help of a few prepoſitions and auxiliary verbs, all the purpoſes of ſignificancy in meaning are accompliſhed; while the words, for the moſt part, preſerve their form unchanged. The diſadvantages in point of elegance, brevity, and force, which follow from this ſtructure of our language, have been before pointed out. But, at the ſame time, it muſt be admitted, that ſuch a ſtructure contributes to facility; it renders the acquiſition of our language leſs laborious, the arrangement of our words more plain and obvious, the rules of our ſyntax fewer and more ſimple. We agree, indeed, with Dr. Lowth, (Preface to his Grammar,) in thinking that the ſimplicity and facility of our language occaſion its being frequently written and ſpoken with leſs accuracy. It was neceſſary to ſtudy languages, which were of a more complex and artificial form, with greater care. The marks of gender and caſe, the varieties of conjugation and declenſion, the multiplied rules of ſyntax, were all to be attended to in ſpeech. Hence language became more an object of art. It was reduced into form; a ſtandard was eſtabliſhed, and any departure from the ſtandard became conſpicuous. Whereas, among us, language is hardly conſidered as an object of grammatical rule. We take it for granted, that a competent ſkill in it may be acquired without any ſtudy; and that, in a ſyntax ſo narrow and confined as ours, there is nothing which demands attention. Hence ariſes the habit of writing in a looſe and inaccurate manner. For perhaps no grammatical rules have ſufficient authority to controul the firm and eſtabliſhed uſage of language. Eſtabliſhed cuſtom, in ſpeaking and writing, is the ſtandard to which we muſt at laſt reſort for determining every controverted point in language and ſtyle. But it will not follow from this, that grammatical rules are ſuperſeded as uſeleſs. In every language, which has been in any degree cultivated, there prevails a certain ſtructure and analogy of parts, which is underſtood to give foundation to the moſt reputable uſage of ſpeech; and which, in all caſes, when uſage is looſe or dubious, poſſeſſes conſiderable authority. In every language, there are rules of ſyntax which muſt be inviolably obſerved by all who would either write or ſpeak with any propriety. For ſyntax is no other than that arrangement of words, in a ſentence, which renders the meaning of each word, and the relation of all the words to one another, moſt clear and intelligible.

All the rules of Latin ſyntax, it is true, cannot be applied to our language. Many of theſe rules aroſe from the particular form of their language, which occaſioned verbs or prepoſitions to govern, ſome the genitive, ſome the dative, ſome the accuſative or ablative, caſe. But, abſtracting from theſe peculiarities, it is to be always remembered, that the chief and fundamental rules of ſyntax are common to the Engliſh as well as the Latin tongue; and, indeed, belong equally to all languages. For, in all languages, the parts which compoſe ſpeech are eſſentially the ſame; ſubſtantives, adjectives, verbs, and connecting particles: and wherever theſe parts of ſpeech are found, there are certain neceſſary relations among them, which regulate their ſyntax, or the place which they ought to poſſeſs in a ſentence. Thus, in Engliſh, juſt as much as in Latin, the adjective muſt, by poſition, be made to agree with its ſubſtantive; and the verb muſt agree with its nominative in perſon and number; becauſe, from the nature of things, a word, which expreſſes either a quality or an action, muſt correſpond as cloſely as poſſible with the name of that thing whoſe quality, or whoſe action, it expreſſes. Two or more ſubſtantives, joined by a copulative, muſt always require the verbs or pronouns, to which they refer, to be placed in the plural number; otherwiſe, their common relation to theſe verbs or pronouns is not pointed out. An active verb muſt, in every language, govern the accuſative; that is, clearly point out ſome ſubſtantive noun, as the object to which its action is directed. A relative pronoun muſt, in every form of ſpeech, agree with its antecedent in gender, number, and perſon; and conjunctions, or connecting particles, ought always to couple like caſes and moods; that is, ought to join together words which are of the ſame form and ſtate with each other. The rule for the prepoſition, and thoſe for ſome other of the parts of ſpeech, may be gathered from the foregoing diſquiſitions on the noun, verb, &c.

Whatever the advantages or defects of the Engliſh language be, as it is our own language, it deſerves a high degree of our ſtudy and attention, both with regard to the choice of words which we employ, and with regard to the ſyntax, or the arrangement of theſe words in a ſentence. We know how much the Greeks and the Romans, in their moſt poliſhed and flouriſhing times, cultivated their own tongues. We know how much ſtudy both the French and the Italians have beſtowed upon theirs. Whatever knowledge may be acquired by the ſtudy of other languages, it can never be communicated with advantage, unleſs by ſuch as can write and ſpeak their own language well. Let the matter of an author be ever ſo good and uſeful, his compoſitions will always ſuffer in the public eſteem, if his expreſſion be deficient in purity and propriety. The many errors, even in point of grammar, the many offences againſt purity of language, which are committed by writers who are far from being contemptible, demonſtrate, that a careful ſtudy of the language is previouſly requiſite, in all who aim at writing it properly. On this ſubject, the reader ought to peruſe Dr. Lowth's Short Introduction to Engliſh Grammar, with Critical Notes; which is the grammatical performance of higheſt authority that has appeared in our time, and in which he will ſee, what has been ſaid concerning the inaccuracies in language of ſome of our beſt writers, fully verified. In Dr. Campbell's Philoſophy of Rhetoric, he will likewiſe find many acute and ingenious obſervations, both on the Engliſh language, and on ſtyle in general. And Dr. Prieſtley's Rudiments of Engliſh Grammar will alſo be uſeful, by pointing out ſeveral of the errors into which writers are apt to fall.

Of PROSODY.

Prosody compriſes *orthoepy*, or the rules of pronunciation; and *orthometry*, or the laws of verſification.

Pronun-

PRONUNCIATION is juſt, when every letter has its proper ſound, and when every ſyllable has its proper accent, or, which in Engliſh verſification is the ſame, its proper quantity.

The *accent* conſiſts in a particular elevation of the voice, by which, in polyſyllables, one ſyllable is as it were raiſed above the others: thus in *emer'gency, employ'ment*, the ſyllables *mer* and *ploy* are called *accentuated ſyllables*. The reaſon of this mode of diſtinguiſhing one ſyllable from another, is properly contained in the nature of the word and the intention of the ſpeaker, who, by this elevation of the voice, points out that ſyllable, which expreſſes the principal idea, and to which he chiefly directs the attention of the hearer. Hence the two accentuated ſyllables, above-mentioned, contain the principal ideas of the words in which they occur, and all the other ſyllables denote only collateral ideas, or further determinations, inflexions, and the like. This, in the nature of the thing, is *properly* the intention of the accent; for this reaſon, in the German, and probably too in all other unmixed languages, we meet with the general rule, that the radical ſyllable, in ſuch words as conſiſt of a plurality of ſyllables, always receives the accent; ſince it contains the principal idea of the word. In the German language this rule is ſo general, that the few exceptions from it ſcarcely deſerve any attention. But, as the Engliſh is a very mixed language, this rule is liable here to a much greater number of exceptions; eſpecially with reſpect to words borrowed from the Latin and French, in which the radical ſyllable has become obſcure, ſo that it cannot in all inſtances preſerve its due accent. But thoſe words from the Anglo-Saxon, which are ſtill current in the Engliſh language, follow this rule, and perhaps as uniformly as in the German.

The great diſtinction of our accent depends upon its ſeat; which may be either upon a vowel or a conſonant. Upon a vowel, as in the words, *glóry, fáther, hóly*. Upon a conſonant, as in the words, *hab'it, bor'row, bat'tle*. When the accent is on the vowel, the ſyllable is long; becauſe the accent is made by dwelling upon the vowel. When it is on the conſonant, the ſyllable is ſhort; becauſe the accent is made by paſſing rapidly over the vowel, and giving a ſmart ſtroke of the voice to the following conſonant. Thus the words, *add', led', bid', rod', cub'*, are all ſhort, the voice paſſing quickly over the vowel to the conſonant: but for a contrary reaſon, the words, *áll, láid, líde, róad, cúbe*, are long; the accent being on the vowels, on which the voice dwells ſome time, before it takes in the ſound of the conſonant. Obvious as this point is, it has wholly eſcaped the obſervation of moſt of our grammarians, and compilers of dictionaries; who, inſtead of examining the peculiar genius of our tongue, have followed the Greek method, of always placing the accentual mark over a vowel. Now the reaſon of this practice among the Greeks was, that as their accents conſiſted in change of notes, they could not be diſtinctly expreſſed but by the vowels; in uttering which, the paſſage is entirely clear for the voice to iſſue, and not interrupted or ſtopped by the different poſitions of the organs in forming the conſonants. But as our accent conſiſts in ſtreſs only, it can juſt as well be placed on a conſonant as a vowel. By this method of marking the accented ſyllable, our compilers of dictionaries, vocabularies, and ſpelling-books, muſt miſlead provincials and foreigners in the pronunciation of perhaps one half of the words in our language. For inſtance; if they ſhould look for the word *endeavour*, finding the accent over the vowel *é*, they will of courſe found it endéavour. In the ſame manner *ded'icate* will be called *dédicate*; precip'itate, preci-pitate; phenom'enon, phenó-menon; and ſo on through all words of the ſame claſs. And in fact we find the Scots do pronounce all ſuch words in that manner; nor do they ever lay the accent upon the conſonant in any word in the whole language; in which the diverſity of their pronunciation from that of the people of England chiefly conſiſts. It is a pity that our compilers of dictionaries ſhould have fallen into ſo groſs an error, as the marking of the accents in the right way would have afforded one of the moſt general and certain guides to true pronunciation, that is to be found with reſpect to our tongue; this therefore is the method we have adopted.

VERSIFICATION is the arrangement of a certain number of ſyllables according to certain laws. The feet of our verſes are either iambic, as *alóft, create*; or trochaic, as *hóly, lófty*. The iambic meaſure comprehends verſes of four, ſix, eight, ten, and even of twelve and fourteen, ſyllables; in all which meaſures the accent is to be placed on the even ſyllables, i. e. the ſecond, fourth, &c. in every line; and every line, conſidered by itſelf, is more harmonious, as this rule is more ſtrictly obſerved. —The trochaic meaſure includes verſes of three, five, and ſeven, ſyllables; the accent being on the odd ſyllables.

There is alſo another meaſure in Engliſh verſe, called the *anapeſtic*, in which, though the number of ſyllables may be even, ſtill the accent is upon the odd one:

May I góvern my páſſions with ábſolute ſwáy,
And grow wíſer and bétter as time wears awáy. *Dr. Pope.*

To this meaſure Mrs. Hannah More has thought fit to refer the heroic meaſure of the French, which ſhe ſays is to be read like our ſong of "A cóbler there wás and he lív'd in a ſtáll." Nothing can be more erroneous, or ſhow a greater ignorance of French metre, than ſuch an aſſertion. The French verſe is our Alexandrine line of twelve ſyllables, with the accent on each even ſyllable; and ſhould be read like "The lóng majéſtic márch and énergy' divíne."—Example:

Je chánte cé herós qui régna ſúr la Fránce
Et pár droit dé conquéte et pár droit dé naiſſánce.

Not as H. M. would read it; Je chánt' ce herós qui regná ſur la Fránce, &c.

Our verſification admits of few licences, except a *ſynalæpha*, or eliſion of *e* in *the* before a vowel, as *th' eternal*; and more rarely of *o* in *to*, as *t' accept*; and a *ſynæreſis*, by which two ſhort vowels coaleſce into one ſyllable, as *queſtion, ſpecial*; or a word is contracted by the expulſion of a ſhort vowel before a liquid, as *av'rice, temp'rance*. Cutting off the *e* in *liv'd, cloſ'd*, &c. is now frequently neglected in poetry, being thought unneceſſary, becauſe the words, though written at length, are generally ſhortened in pronunciation, even in proſe. But this reaſon is very inſufficient; for the meaſure frequently requires ſuch words to be pronounced with their full complement of ſyllables. Inſtances are very numerous indeed in Spenſer; but we ſhall quote only one from a modern writer:

Her eyes which ſo beautiful ſhone
Are cloſed for ever in ſleep. *Lyttleton.*

On the other hand, a cuſtom has obtained of printing the words *though* and *through* elliptically, thus, *tho', thro'*: now, being words already of one ſyllable, there can be no neceſſity for contracting them, as the ellipſis cannot make them more ſuitable to the meaſure of any verſe.

OF PUNCTUATION.

Punctuation has generally been conſidered as a modern invention; but ſome ſpecies of pauſes and diviſions of ſentences in ſpeaking and writing muſt have been coeval with the knowledge of communicating ideas by ſounds or by ſymbols. Suidas ſays, that the period and the colon were diſcovered and explained by Thraſymacus, about 380 years before the Chriſtian era. Cicero ſays, that Thraſymacus was the firſt who ſtudied oratorical numbers, which entirely conſiſted in the artificial ſtructure of periods and colons. It appears from a paſſage in Ariſtotle, that punctuation was known in his time. The learned Dr. Edward Bernard refers the know-

ledge of pointing to the time of that philoſopher, and ſays, that it conſiſted in the different poſitions of one ſingle point. At the bottom of a letter, thus, (A.) it was equivalent to a comma; in the middle (A·) it was equal to a colon; at the top (A˙) it denoted a period, or the concluſion of a ſentence. This mode was eaſily practiſed in Greek manuſcripts, while they were written in capitals. But when the ſmall letters were adopted, that is, about the ninth century, this diſtinction could not be obſerved; a change was therefore made in the ſcheme of punctuation.

According to Cicero, the ancient Romans, as well as the Greeks, made uſe of points. He mentions them under the appellation of *librariorum notæ*; and in ſeveral parts of his works he ſpeaks of *interpunctæ clauſulæ in orationibus*, of *clauſulæ atque interpuncta verborum*, of *interpunctiones verborum*, &c. Seneca, who died A.D. 65, expreſsly ſays, that Latin writers, in his time, had been uſed to punctuation. *Nos, cum ſcribimus, interpungere conſuevimus.* Muretus and Lipſius imagined that theſe words alluded to the inſertion of a point after each word: but they certainly miſtook; for they muſt neceſſarily refer to marks of punctuation in the diviſion of ſentences, becauſe, in the paſſage in which theſe words occur, Seneca is ſpeaking of one Q. Haterius, who made no pauſes in his orations. According to Suetonius, Valerius Probus procured copies of many old books, and employed himſelf in correcting, pointing, and illuſtrating, them; devoting his time to this and no other part of grammar. It appears from hence, that in the time of Probus, or about the year 68, Latin manuſcripts had not been uſually pointed, and that grammarians made it their buſineſs to ſupply this deficiency.

Quinctilian, who wrote his celebrated treatiſe on Oratory about the year 88, ſpeaks of commas, colons, and periods; but it muſt be obſerved, that by theſe terms he means clauſes, members, and complete ſentences, and not the marks of punctuation. Ælius Donatus publiſhed a treatiſe on Grammar in the fourth century, in which he explains the *diſtinctio*, the *media diſtinctio*, and the *ſubdiſtinctio*; that is, the uſe of a ſingle point in the various poſitions already mentioned. Jerom, who had been the pupil of Donatus, in his Latin Verſion of the Scriptures made uſe of certain diſtinctions or diviſions, which he calls *cola* and *commata*. It has, however, been thought probable, that theſe diviſions were not made by the addition of any points or ſtops; but were formed by writing, in one line, as many words as conſtituted a clauſe, equivalent to what we diſtinguiſh by a comma or a colon. Theſe diviſions had the appearance of ſhort irregular verſes in poetry. There are ſome Greek manuſcripts ſtill extant, which are written in this manner.

Though punctuation had been for ſo many hundred years in uſe, yet the period, in different poſitions, as before obſerved, had ſerved every purpoſe; and our very early printers employed no other mark, but uſed it indiſcriminately for every pauſe. The colon was introduced about the year 1485; the comma about 1521; and the ſemicolon, after being long uſed as a contraction for *ue* in *que*, as *arma virumq*; is ſaid to have been firſt introduced as a ſtop by our countryman ſir Philip Sidney, in 1587. The ſemicolon is not uſed in Roger Aſcham's Schoolmaſter, printed in 1570. About the year 1578, we begin to obſerve the inverted commas (") as a mark for quotations; alſo parentheſes (), crotchets or brackets [], the note of interrogation (?); alſo the marks of reference, as *, †, ¶; and the accents, ', `, ^.

The ſyſtem of points, as now uſed, may be regarded as ſufficient for every purpoſe of elucidation; though ſome would diſcard the ſemicolon altogether; and others, on the contrary, are of opinion that we rather want an additional point, a *ſemicomma*. But let us proceed to demonſtrate the uſe of thoſe we have.

The art of punctuation, though of the greateſt importance in writing, in printing, and in directing the voice of the reader, has hitherto been much neglected, or conſidered as an arbitrary invention, depending on fancy and caprice. "The doctrine of punctuation," ſays biſhop Lowth, "muſt needs be very imperfect; few preciſe rules can be given which will hold without exception in all caſes, but much muſt be left to the judgment and taſte of the writer." Our writers ſeem to have availed themſelves of this conceſſion: infected with the daſhing mania of Sterne, many of them appear even to have given up this modern art in deſpair, and to have conſidered it as already obſolete, or at leaſt uncertain. Yet a little attention to this art, however imperfect it may be, would much conduce to the intelligibility of ſome of theſe very authors. In moſt of them we indeed meet with commas, ſemicolons, colons, and periods; but in ſuch confuſion, that the old Roman manner, *continuo ductu*, would be as comprehenſible. The practice is here in fault, and deſerves ſevere reprehenſion. The arbitrary uſage of the fourteenth century is not creditable in a writer of the nineteenth. We ſhall therefore undertake to ſhow, by the following rules, that a right punctuation is founded on rational and determinate principles; and is really an indiſpenſible part of grammar.

ESSENTIAL and GENERAL RULES for POINTING.

I. Two ſubſtantives, or any two words of the ſame part of ſpeech, connected by the conjunction *and*, do not admit of a comma between them.—*Examples.* 1ſt. Of Subſtantives: "Painting and ſculpture are imitations of viſible objects."—2d. Of Verbs: "The ſtudy of natural hiſtory expands and elevates the mind."—3d. Of Pronouns: "You and I were formerly inſeparable."—4th. Of Adverbs: "However eaſily and agreeably you may conduct yourſelf, a rival will deal his praiſe but ſparingly and cautiouſly."

II. Three or more ſubſtantives, pronouns, adverbs, &c. in the ſame caſe, &c. and in immediate ſucceſſion, are ſeparated by commas.—*Ex.* 1ſt. Of Subſtantives: "Climate, ſoil, laws, cuſtoms, food, and other accidental differences, have produced an aſtoniſhing variety in the complexion, features, manners, and faculties, of the human ſpecies."—2d. Of Pronouns: "He, you, and I, went with her, him, and them, into the country."—3d. Of Adverbs: "However truly, eloquently, and forcibly, he ſpoke on the ſubject, it made no impreſſion on the audience."

The common, but very erroneous, practice, is to omit the laſt comma, or that which ſeparates the laſt ſubſtantive, &c. from the reſt of the ſentence; and ſometimes to omit that alſo which precedes the word *and*:

Ex. ——— "Now beneath the walls
At their command arms, food and fire they bring."
Lewis's Statius, x. 28.

Which certainly ſhould be pointed thus:

Now beneath the walls,
At their command, arms, food, and fire, they bring.

III. Subſtantives, or any words of the ſame part of ſpeech, immediately following one another, in the ſame caſe, tenſe, &c. and joined in pairs by the conjunction *and*, are ſeparated in pairs by commas.—*Ex.* 1ſt. Of Subſtantives: "Shape and beauty, worth and education, wit and underſtanding, gentle nature and agreeable humour, honour and virtue, were to come in for their ſhare of ſuch contracts."—2d. Of Verbs: "If honour were to prompt and impel, guide and direct, enforce and execute, all our wiſhes, laws would be uſeleſs."—3d. Of Adjectives: "He behaved himſelf in a manner eaſy and agreeable, affable and courteous, obliging and mild."—4th. Of Adverbs: "He behaved himſelf eaſily and agreeably, affably and courteouſly, obligingly and mildly."

IV. Two ſubſtantives, or any other words of the ſame part of ſpeech, connected by the disjunctive *or*, ſhould have

have a comma between them, if the latter be explanatory of the former; but, when the former word will admit the word *either* to precede it, the latter cannot be explanatory of the former, conſequently a comma is unneceſſary.—*Ex.* "Milton too frequently uſes technical words, or terms of art."—"You certainly muſt be [*either*] mad or fooliſh."—The difference is obvious. It is allowed, that punctuation ſhould not only direct the reader in pauſe, but ſhould point to the ſenſe of an author; and, in this caſe, the comma is made to perform its double office.

V. Nouns in appoſition, that is, nouns added to other nouns in the ſame caſe, by way of explication, or illuſtration, when accompanied with adjuncts, are ſeparated from the reſt of the ſentence by commas.—*Ex.* "Cupid, the god of love, was the ſon of Venus, the goddeſs of beauty."—In this example, *the god of love* is in appoſition to *Cupid*, and *the goddeſs of beauty* is in appoſition to *Venus*.

VI. Two nouns in appoſition, not accompanied with adjuncts, the latter noun forming, as it were, part of a proper name, are not divided.—*Ex.* "The emperor Antoninus wrote an excellent book."

VII. Expreſſions in a direct addreſs, or what is called in Latin the vocative caſe, are ſeparated from the reſt of the ſentence by commas.—*Ex.* "Beware, Amaſia, of the artful ſycophant."

To ſhow more clearly the uſe of the comma after the vocative caſe, let us take the following ſentence; and firſt we ſhall ſet it down without any point: "Sextus Nævius my client does not vie with you in intereſt." *Guthrie's Cicero*, iii. 349. Thus pointed, we cannot tell who was Cicero's client. If we ſhould point thus, "Sextus Nævius, my client, does not vie, &c." it would appear that S. Nævius was his client. But the true pointing, "S. Nævius, my client does not vie, &c." ſhews at once, that S. Nævius is the perſon addreſſed, or in the vocative caſe, and that the client was (P. Quintius) a perſon not then named.

VIII. A noun or pronoun, in what is called the caſe abſolute, and the participle, &c. with which it is connected, when it begins a ſentence, ſhould be ſeparated from the reſt of the ſentence by a comma.—*Ex.* "Harold being ſlain in the field, the conqueror marched directly to London."—"Harold's being ſlain in the field cauſed great joy to the friends of the conqueror."—In this latter example, *Harold's being ſlain in the field* is the complex nominative caſe to the verb *cauſed*, and does not therefore admit of a comma, notwithſtanding the length of the ſentence.

IX. Two adjectives, belonging to a ſubſtantive immediately following, with or without conjunctions, admit the intervention of no point.—*Ex.* "Beware of a cenſorious four ſeverity."—Commas placed after each adjective would be too rigid, and therefore the commas muſt be totally expunged. Another reaſon is, that the firſt adjective may be conſidered as acting adverbially upon the ſecond, (as if it had ſtood "cenſoriouſly-four,") and therefore admits no ſeparation from it or from its ſubſtantive. But the prevailing method, of putting a comma after the firſt only of two adjectives, ("Beware of a cenſorious, four ſeverity,") is abſurd in the higheſt degree. Take the following inſtance: In the edition of Boyer's French Grammar from which the compiler of this article ſtudied when a boy, the title-page expreſſes, among other things, "A Well digeſted, and copious Vocabulary." Here the *digeſted Well* is made quite a diſtinct thing from the Vocabulary, and is what no one would expect to find in a French Grammar.

A ſimilar rule holds with the verb: Two adverbs belonging to a verb immediately following muſt not have a point between them. The following inſtance will ſhow the abſurdity of departing from this rule: "Camden's Britannia is a work too long, and too well known, to have its merits now eſtimated." *Monthly Rev.* iii. 176. If we read this ſentence according to its punctuation, we ſhall ſuppoſe, that one reaſon why the merits of the Britannia cannot or need not now be eſtimated, is becauſe the work is *too long*; but, from the word *now* being inſerted, it can hardly be doubted but the writer of the article meant to ſay, that work had been *too long known* and *too well known*: therefore the comma after the word *long* ſhould have been omitted.

The abſurdity of inſulating certain words from thoſe they immediately belong to occurs ſo very frequently, that few books can be opened without preſenting inſtances ſuch as the following:—"A dray, or cart-horſe, ſhould be ſmooth trimmed about the head and ears." *Laurence on Horſes*, i. 308.—"As I choſe rather to be an ear, than an eye-witneſs of ſuch events, I departed." *Guthrie's Cicero*, ii. 20.—Here the word *dray* and the word *ear* are moſt carefully ſeparated from the very words which the ſenſe ſo cloſely connects them with; and even the hyphen is preſſed into the ſervice to increaſe the abſurdity.

X. Three or more adjectives, belonging to the ſame ſubſtantive, are ſeparated from each other, and from their concordant ſubſtantive, by commas.—*Ex.* "Sacred hiſtory is a ſimple, chaſte, faithful, diſpaſſionate, impartial, detail of facts."

XI. Three or more verbs having the ſame nominative caſe, and immediately following one another, are ſeparated by commas.—*Ex.* "Exerciſe ferments the humours, caſts them into their proper channels, throws off redundancies, and aſſiſts nature in her neceſſary operations."

XII. Several verbs in the infinitive mood, depending on one common word, and immediately ſucceeding one another, are divided by commas.—*Ex.* "The Spartan youth were accuſtomed to go barefoot, to lie on the ground, to ſuffer heat and cold, to live on the moſt ordinary proviſions, to be engaged in continual exerciſe, and to be enured to blows and wounds."

XIII. When the expreſſion is ſuch as would be tranſlated into Latin by a prepoſition and a gerundial adjective, a comma muſt always precede; for that expreſſion, in Engliſh, is ſtrictly rendered *in order to*, although it more frequently differs not in form from the infinitive mood.—*Ex.* "An old man muſt be a father, *to bear* the follies and abſurdities of youth."—In this place, *to bear* means *in order to bear*; and this is a diſtinction between the two ways in which the infinitive mood may be uſed.

XIV. A remarkable expreſſion, or a ſhort obſervation, in the form of a quotation, ought to be ſeparated from the words which introduce and follow it: If the quotation be very ſhort, or cloſely connected with the context, a comma will be ſufficient.—*Ex.* "Swift ſays, no wiſe man ever wiſhed himſelf younger."

XV. Between a nominative caſe and its verb, or between a verb and its objective caſe, no point can be admitted, provided they immediately ſucceed each other; but all words and ſentences that intervene, except an adverb or the like, are to be included between commas; and, when the nominative and objective caſes are not connected with their verbs by juxta-poſition, it is univerſal to lead from one to the other by commas.—*Ex.* "Epicurus, we are told, left behind him three hundred volumes of his works."—"Epicurus undoubtedly left behind him three hundred volumes of his works."

No ſingle uncompounded ſentence, conſiſting of a nominative caſe, a verb, and its objective caſe, can be ſo long as to juſtify the inſertion of a comma. As the natural connexion between thoſe parts of ſpeech, and their dependence upon each other, would be divided, the comma, ſo inſerted, would be improper. A pauſe in reading, indeed, may be allowable; but not a pauſe of ſuch length as the comma indicates. Beſides, there would ariſe a difference of opinion, in whether the pauſe ſhould follow the nominative caſe or precede the objective caſe. There are infinite inflections and pauſes of

the voice neceſſary to good reading, which the preſent points can never denote; but theſe modulations muſt be intirely left to the diſcretion and feeling of the reader.

Thus much for the comma. Thoſe, who are acquainted with the proper uſe of this point, will ſeldom be at a loſs in the others.

XVI. A ſemi-colón may be uſed, in dividing ſentences, where the grammatical conſtruction is not fully complete.—*Ex.*

"There entertain him all the ſaints above,
In ſolemn troops and ſweet ſocieties
Who ſing; and, ſinging, in their glory move."

The above rule, it ſhould be obſerved, is given chiefly as a mark of diſtinction between the uſe of the ſemi-colon and colon, as the colon ſhould not be uſed but where the grammatical conſtruction is quite complete. In juſtice to the author of the Elements of Punctuation, from whom we have borrowed theſe rules, we mention this, becauſe the Critical Review, vol. ii. for 1786, p. 73. taking the rule in itſelf, without the diſcriminating principle expreſſed by the author, treated the work very unhandſomely. See Steel's Elements of Punctuation, 2d. edit. p. xiv.

XVII. Semi-colons aptly divide ſentences that have one common nominative caſe, when any of them contain two or three clauſes; for the ſemi-colon ſhews the completion of each ſentence; and a diſtinction is thereby preſerved, which a continuance of commas would deſtroy.—*Ex.*

——— "Induſtry approach'd,
And rous'd him from his miſerable ſloth;
His faculties unfolded; pointed out
Where laviſh nature the directing hand
Of art demanded; ſhew'd him how to raiſe
His feeble force by the mechanic powers,
To dig the mineral from the vaulted earth,
On what to turn the piercing rage of fire,
On what the torrent of the gather'd blaſt;
Gave the tall ancient foreſt to his axe;
Taught him to chip the wood and hew the ſtone,
Till, by degrees, the finiſh'd fabric roſe;
Tore from his limbs the blood-polluted fur,
And wrapt them in the woolly veſtment warm,
Or bright in gloſſy ſilk and flowing lawn."

The infinitive moods in the 5th, 7th, and 8th, lines of this example, viz. *to raiſe, to dig, to turn*, are dependent upon the verb *ſhew'd*; and therefore, with their adjuncts, form but one ſentence, ſeparated at the end by a ſemi-colon. Whatever point a ſentence or member of a ſentence may require at the end of it, points of inferior power ſhould be uſed in the middle.

XVIII. A colon is admiſſible only where the grammatical conſtruction is quite perfect.—*Ex.*

"Then, too, the pillar'd dome magnific heav'd
Its ample roof; and Luxury, within,
Pour'd out her glittering ſtores: the canvas ſmooth,
With glowing life protuberant, to the view
Embodied roſe: the ſtatue ſeem'd to breathe."

XIX. Parenthetical marks demand every point which the ſenſe would require if the parentheſis were omitted, except where the parentheſis is interrogative or exclamatory.—*Ex.*

——— "As armies, at the call
Of trumpet, (for of armies thou haſt heard,)
Troop to their ſtandard, &c." *Milton.*

——— "Therefore, th' omnipotent
Eternal Father (for where is not he
Preſent?) thus to his Son audibly ſpake." *Milton.*

——— "They, not obeying,
Incurr'd (what could they leſs?) the penalty;
And, manifold in ſin, deſerv'd to fall." *Milton.*

To produce rules ſufficient for every purpoſe of compoſition, in all the poſſible variations of phraſe and conſtruction, would be tedious, difficult, and ineffectual: their number would deſtroy their utility. A nice acquaintance with punctuation is ſcarcely attainable by rules, as a knowledge of ſyntax may be acquired; but it muſt be procured by a kind of internal conviction, that the rules of grammar are never to be violated. What is meant by never violating the rules of grammar, is, that a proper connexion be always preſerved, in compound ſentences, between the nominative caſe, however complex, and its verb; the verb and its objective caſe, however complex; the relative and its antecedent. And this is to be chiefly attained by a liberal and proper uſe of the comma.

Let us take an inſtance from the work before us, vol. iv. p. 835. "Columna compiled a chronicle in thirty-ſix books, and wrote ſeveral hiſtorical tracts in relation to England." Was the *chronicle* relative to England? If ſo, there ſhould be a comma after the word *tracts*; if not, the ſentence is rightly pointed, but then we do not know what the chronicle was about.

The following line from Lewis's Statius is rendered almoſt unintelligible by wrong punctuation: "Deep, deep within Death, his half-brother lies." From this punctuation it would appear, that the half-brother of Death, or of ſome other perſon, had got deep within Death. Let us point it properly, "Deep deep within, Death, his half-brother, lies;" and we at once perceive the meaning to be, that *deep within* the cave lay *Death, the half-brother* of ſome being mentioned before.

Moſt people have heard an anecdote ſaid to be connected with the murder of our Edward II. A note, intended to encourage the murder, was written, by a perſon in authority, to the keeper of Berkeley-caſtle, in theſe words: *Edvardum occidere nolite timere, bonum eſt*; which, if pointed as above, is clearly an encouragement to the murder; remove the comma from *timere* to *nolite*, and it is the direct contrary. But the ſcrap was written without any point at all, ſo that it might be interpreted as ſuited the convenience or deſigns of the parties.

As points, when uſed at all in writing, are very frequently put in at hazard, they ſometimes have a ludicrous effect in altering the ſenſe, or at leaſt the meaning. Under Sharp's portrait of Brothers are theſe words: "Believing Brothers to be a prophet really appointed by God, I have engraved his portrait." By a ſlip of the graver, the comma was put in the wrong place, and the ſubſcription ſtood thus: "Believing Brothers to be a prophet really appointed, by God I have engraved his portrait." Theſe miſtakes, ludicrous or ſerious, are moſtly in the placing of the comma; and it has been before obſerved, that thoſe, who are intimate with the comma, will ſeldom be at a loſs in placing the other points.

Few will heſitate in placing the period; for almoſt all know when the ſenſe is complete; and, conſequently, ſuppoſing them poſſeſſed of the comma's uſe and of the period's ſituation, the difficulty is reduced to the remaining two only. The colon never intervenes in grammatical conſtruction, and the ſemi-colon but ſeldom; they are uſeful in marking a different degree of connexion between one ſentence and another; but in reading no material error can ariſe from ſubſtituting one for the other. It is becauſe the colon never interferes in grammatical conſtruction, that it was ſo long a cuſtom, in printing, to place a capital letter after a colon, the ſame as after a period: this was adhered to as long as books were printed with a capital letter to every ſubſtantive.

Punctuation ſhould lead to the ſenſe; the ſenſe will guide to modulation and emphaſis. When punctuation performs its office thus, it will point out likewiſe the grammatical conſtruction; for the ſenſe of a paſſage and its

its grammatical conſtruction are inſeparable. It follows, that a knowledge of grammar is neceſſary; it certainly is; and any rules, militating againſt grammar, may be made ſpecious, but they will ultimately be found defective.

In poetry, where ſubordinate ſentences muſt be introduced ſo as to preſerve the rhime or meaſure, punctuation is more particularly ſerviceable to the ſenſe. In proſe, the habitual phraſe of life, we can more readily perceive it; and the omiſſion or inſertion of a point does not long ſuſpend the judgement from diſcovering the meaning of an author: but, in metrical compoſitions, where ſentences are incomplete for, perhaps, four or five lines together, a proper uſe of the points agreeably facilitates our approximation to the ſenſe; and we find pleaſure in the peruſal proportionate to the readineſs and eaſe with which we diſcover the meaning of our author.

It certainly is among our deſiderata, that juſt punctuation ſhould be more generally cultivated. Did it form an attentive part of our education, a reference to books would teach the minutiæ better than any rules. With a few exceptions, we might recommend the numbers of the Monthly Review as a model for correct punctuation; we think they offend chiefly againſt the ixth rule.

The above rules for punctuation, and many of the remarks, are extracted from Steel's Elements of Punctuation, a book which contains every thing that can be deſired on the ſubject. The author of it was an elegant ſcholar, and bred to a profeſſion moſt likely to induce an attention to the minutiæ of literature, that of a printer. The literary world has cauſe to lament his premature death; and the compiler of this article takes the preſent opportunity of paying a tribute of reſpect to the memory of his departed friend, the gay companion of his boyiſh days.

GRAM'MAR-SCHOOL, *ſ.* A ſchool in which the learned languages are grammatically taught.

GRAMMA'RIAN, *ſ.* [*grammairien*, Fr. from *grammar*.] One who teaches grammar; a philologer.—The term *grammarian*, in ancient times, appears to have been applied as a title of literary honour to diſtinguiſhed writers. Even as late as the ſixteenth century, Baillet obſerves, that Saxo Grammaticus was thus called merely for the beauty of his ſtyle; and Thomas d'Avergne, a civilian of Naples, who lived in 1580, although he wrote upon no ſubject but what related to his profeſſion, is diſtinguiſhed by the title of *Grammarian*.

GRAMMA'TIC, or GRAMMA'TICAL, *adj.* [*grammaticus*, Lat.] Belonging to grammar.—I ſhall take the number of conſonants, not from the *grammatical* alphabets of any language, but from the diverſity of ſounds framed by ſingle articulations with appulſe. *Holder.*—Taught by grammar.—They ſeldom know more than the *grammatical* conſtruction, unleſs born with a poetical genius. *Dryden.*

GRAMMA'TICALLY, *adv.* According to the rules or ſcience of grammar.—When a ſentence is diſtinguiſhed into the nouns, the verbs, pronouns, adverbs, and other particles of ſpeech which compoſe it, then it is ſaid to be analyſed *grammatically*. *Watts.*

GRAMMATICAS'TER, *ſ.* [Latin.] A mean verbal pedant; a low grammarian.—I have not vexed language with the doubts, the remarks, and eternal trifling, of the French *grammaticaſters*. *Rymer.*

GRAM'MATIST, *ſ.* [from γραμμα, Gr. a letter.] A young grammarian; a grammaticaſter. *Cole.*

GRAM'MEN, a town of Flanders: five miles ſouth-weſt of Deinſe.

GRAM'MIC, *adj.* [*grammicus*, Lat. of γραμμη, Gr. a line.] Made by lines; demonſtrated by lines.

GRAMMI'TIS, *ſ.* in botany, a genus of the claſs cryptogamia, order filices. Generic characters—Fructification in ſtraight ſcattered lines; involucre, none.

Species. 1. Grammitis linearis: fronds linear, pointed, entire: ſtalks briſtly.

2. Grammitis marginella: fronds lance-lingulate, edged with brown: ſtalks very ſhort, ſlightly ciliate.

3. Grammitis lanceolata: fronds lanceolate, pointed, tapering to the baſe: lines of fructification nearly parallel with the rib.

4. Grammatis ſerrulata: fronds linear, toothed, from a rooting ſhoot.

5. Grammitis graminoides: fronds linear, undivided and forked at top: line of fructification ſolitary, terminal.

6. Grammitis myoſuroides: fronds pinnatifid: ſegments ſemiovate, obtuſe; upper ones united into a linear fructiferous tip.

GRAM'MONT, or GEERSBERGHE, a town of Flanders, which was in the beginning only a caſtle, built at the foot of a mountain by the Goths, and thence called Gotteghem. Baldwin de Mons, comte of Flanders and Hainaut, having purchaſed the lordſhip of Gerard, in 1068, he built a town, and called it the name of the former lord, Gerardmont, by corruption Grammont. It is ſituated for the moſt part on a hill, with the river Dender running through it, and ſeparating it into the Higher and Lower town: twenty miles weſt of Bruſſels, and ten ſouth-weſt of Oudenarde.

GRAM'PIAN HILLS, mountains of Scotland, which extend through the counties of Perth, Angus, Mearns, and Aberdeen. They take their name from a ſingle hill, the Mons Grampius of Tacitus, where Galgacus waited the approach of Agricola, and where the battle was fought ſo fatal to the brave Caledonians. Antiquarians have not agreed upon the particular ſpot.

GRAM'PLE, *ſ.* A crab fiſh. *Ainſworth.*

GRAM'POUND, an ancient town in Cornwall, diſtant 243 miles from London. It has a bridge over the river Vale, or Fale; and was made a borough ſo early as the reign of Edward III. Some think that this town is the Voluba of the ancients, becauſe it ſtands on the ſame river; and that on the building of the bridge it was changed into Grandpont. By the charter of king Edward it was endowed with large privileges, particularly freedom of toll through all Cornwall, a market on Saturday, and fairs on January 18, March 25, and June 11, which the burgeſſes hold of the duchy of Cornwall, in fee-farm, confirmed by Henry VIII. Here are ſtill the remains of a famous Cædefula, which, in Britiſh, ſignifies Felon wood, granted, with all the lands in it, to the town, in the time of Edward III. The corporation conſiſts of a mayor, eight magiſtrates, a recorder, and town-clerk. The river Fale riſes about two miles weſt of Roche Hills, and, running about eight miles in a ſouthern direction, becomes a conſiderable river at this place, where it paſſes under a ſtrong bridge. About a mile below this bridge the river was formerly navigable, at leaſt for boats; but the country has for ſome time been deprived of that advantage. Here is a conſiderable manufactory of gloves.

GRAM'PUS, *ſ.* A large fiſh of the cetaceous kind. See the article DELPHINUS, vol. v. p. 684, and the correſpondent engraving.

GRAN, a river of Hungary, which joins the Danube oppoſite Gran.

GRAN, or ESZTERGON, a town of Hungary, ſituated near the conflux of the rivers Gran and Danube; the ſee of an archbiſhop. In 1683, this town was taken by the king of Poland, and prince Charles of Lorraine, after a ſiege of five days. The Turks had been in poſſeſſion of it 143 years. The loſs of this fortreſs coſt the vizier his life, who might eaſily have covered the town, if he had not retreated to Eſzek, from whence retiring to Belgrade, he was ſtrangled by order of the grand ſignor: fifty-five miles ſouth-eaſt of Preſburg, and eighty-two eaſt-ſouth-eaſt of Vienna.

GRA'NA,

GRA'NA, a ſea-port town of Spain, in the province of Galicia: two miles weſt of Ferrol.

GRA'NA, a town of Italy, in the duchy of Aoſta: twelve miles eaſt-ſouth-eaſt of Aoſta.

GRA'NA PARADISI, *ſ.* in botany. See AMOMUM.

GRANADIL'LA, *ſ.* in botany. See PASSIFLORA.

GRAN'ADA. See GRENADA.

GRANA'DO. See GRENADE.

GRAN'ADO (El), a town of Spain, in the province of Seville: five leagues north of Ayamonte.

GRAN'AL, a town of Spain, in the province of Leon: twenty-eight miles ſouth-eaſt of Leon.

GRAN'ARD, a town of Ireland, in the county of Longford: eleven miles north-eaſt of Longford, and ſixteen ſouth of Cavan.

GRAN'ARY, *ſ.* [*granarium*, Lat.] A ſtorehouſe for threſhed corn.—Ants, by their labour and induſtry, contrive that corn will keep as dry in their neſts as in our *granaries*. *Addiſon*.

The two moſt important cautions to be obſerved in the building of granaries are, to make them ſufficiently ſtrong, and to expoſe their apertures or windows to the moſt drying winds. In this free country, public granaries have never been conſidered as an object worthy of the attention of the legiſlature. In moſt other countries, however, they appear to claim the firſt regard of the commonweal. In Geneva, the public granary is a very large building, of ſix ſtories high. Every ſtory forms one apartment for grain ungrinded only, becauſe meal or grinded grain can by no means be long preſerved. The dimenſions of each apartment are the ſame, in length about thirty-ſix paces, by twenty-four in breadth, and about nine feet in height. To ſupport the great extent of floor, and ſuch a weight of grain, there are very large and ſolid wooden pillars, through every apartment from top to bottom. There are ſix rows of theſe pillars, and nine pillars in every row; the diſtance of one pillar from another is ſix paces. The grain is chiefly wheat, imported occaſionally from Barbary, Sardinia, Franche Compté, &c. The loweſt flat of this granary is ſtored with as much grain as can be packed or heaped in it, and the quantity is gradually diminiſhed as they riſe to the upper ſtories, for the obvious purpoſe of ſaving labour and expence. Every apartment has many very cloſe windows, which are opened in dry weather, for the benefit of ventilation. Before they lodge the grain, it is moderately and ſkilfully kiln-dried, yet while it continues new, it muſt be turned over at leaſt once in twenty days. When this practice has been continued till the grain becomes ſufficiently firm and dry, generally in two years, it is rarely neceſſary to turn it any more. By this method of management, they have experience of preſerving the grain in perfect ſoundneſs for many years, and they have no doubt that it may be ſo preſerved even for a century. Thus by wiſe regulations, and well-directed economy, the public granaries are here rendered effectual means of reſtraining monopolies, moderating the markets, and preventing the calamities of ſcarcity, or exceſſive prices for bread. For other intereſting particulars on this ſubject, and the method of preſerving grain from the ravages of inſects, ſee the article CORN, vol. v. p. 207.

GRAN'ATAN, a town of Germany, in the circle of Upper Saxony, and circle of Erzgeburg: twelve miles north-eaſt of Freyburg.

GRANATA'RIUS, *ſ.* An officer who kept the corn chamber in a religious houſe.

GRAN'ATE, *ſ.* [from *granum*, Lat.] A kind of marble ſo called, becauſe it is marked with ſmall variegations like grains: more properly written GRANITE, which ſee.

GRAN'ATE, *ſ.* See GARNET.

GRAN'ATE, *adj.* [*granatus*, Lat.] That hath many grains or kernels.

GRAN'ATUM, *ſ.* in botany. See PUNICA.

GRAN'BY, a townſhip of the American States, in Eſſex county, Vermont.

GRAN'BY, a townſhip of the American States, in Hampſhire county, Maſſachuſetts, eaſt of South Hadley, about ninety miles weſterly of Boſton; incorporated in 1768, and contains, by the cenſus, 596 inhabitants.

GRAN'BY, a townſhip of the American States, in Hartford county, Connecticut, on the line which ſeparates Connecticut from Maſſachuſetts. It was formerly a part of Symſbury, and is eighteen miles north of Hartford.

GRAN'BY, a town of the American States, on the Congaree, in South Carolina, about two miles below the junction of Broad and Saluda rivers. Here a curious bridge has been built, whoſe arches are ſupported by wooden pillars, ſtrongly ſecured in iron-work, fixed in the ſolid rock. Its height is forty feet above the level of the water. The centre arch is upwards of one hundred feet in the clear, to give a paſſage to large trees which are always brought down by the floods. The ingenious architect has the toll ſecured to him by the legiſlature for one hundred years.

GRAN'BY BAY, a bay on the north coaſt of the iſland of Dominica. Lat. 15. 42. N. lon. 61. 25. W. Greenwich.

GRAN'CEY, a town of France, in the department of the Côte-d'Or, and chief place of a canton, in the diſtrict of Is-ſur-Tille: ſeven leagues ſouth-eaſt of Châtillon-ſur-Seine, and three and a half north-weſt of Is-ſur-Tille.

GRANCOLA'S (John), a French writer in eccleſiaſtical antiquities, and a native of Paris, where he died in 1732. He was admitted to the degree of doctor by the faculty of the Sorbonne, in 1685. He was made chaplain to the duke of Orleans, the regent, and after his death chaplain of St. Bennet's. Becoming attached to the ſtudy of eccleſiaſtical rites and uſages, he made large collections from the fathers, and publiſhed a great number of treatiſes, from the year 1692 to 1728, which, though chiefly compilations, ſerve to throw great light on the diſcipline and ceremonies of the Greek and Latin churches. His principal works, beſides a tranſlation into French of The Works of St. Cyril, 1715, 4to. were, 1. A Treatiſe on Liturgies, or the Manner of celebrating Maſs, in every Age, both in the Eaſtern and Weſtern Churches, 1698, 12mo. 2. The ancient Sacramentary of the Church, 1699. 3. An Hiſtorical Commentary on the Roman Breviary, 1727, in 2 vols. 12mo. 4. A Critique on Eccleſiaſtical Authors, in 2 vols. 8vo. 5. A Conciſe Hiſtory of the Church in the City of Paris, in 2 vols. 12mo.

GRANC'WOLDEN, a town of Norway, in the dioceſe of Chriſtiania: twenty-ſix miles ſouth of Chriſtiania.

GRAND, *adj.* [*grand*, Fr. *grandis*, Lat.] Great; illuſtrious; high in power or dignity.—God had planted, that is, made to grow, the trees of life and knowledge, plants only proper and becoming the paradiſe of ſo *grand* a Lord. *Raleigh*.—Great; ſplendid; magnificent:

A voice has flown
To re-enflame a *grand* deſign. *Young*.

Principal; chief:

What cauſe
Mov'd our *grand* parents in that happy ſtate,
Favour'd of heav'n ſo highly, to fall off
From their Creator. *Milton*.

Eminent; ſuperior: very frequently in an ill ſenſe.—So clomb this firſt *grand* thief into God's fold. *Milton*.—Noble; ſublime; lofty; conceived or expreſſed with great dignity. It is uſed to ſignify aſcent or deſcent of conſanguinity.

GRAND (Anthony le), a French carteſian philoſopher in the ſeventeenth century, called the abbreviator of Deſcartes, born at Douay. He was the author of various

various works, of which the principal were, 1. *Inſtitutio Philoſophiæ ſecundum Principia Ren. Deſcartes*, 4to. 2. *Curioſus Naturæ Arcanorum Perſcrutator*, 1673, 8vo. 3. Notes upon The Phyſics of Rohault, which have been frequently printed. 4. *Hiſtoria Sacra a Mundo condito ad Conſtantinum Magnum*, 8vo. which is his beſt performance.

GRAND (Joachim le), a political and hiſtorical writer, born in 1653, at Thorigny in Normandy. He entered into the congregation of the Oratory, which he quitted in 1676, and went to Paris, where he engaged in the education of two young men of rank, and at the ſame time applied to hiſtorical ſtudies under the direction of father Le Cointe. He firſt appeared as a writer in 1688, when he publiſhed A Hiſtory of the Divorce of Henry VIII. and Catharine of Arragon, 3 vols. 12mo. In this he attempts to juſtify the jeſuit Sanders, and to refute the two firſt books of Burnet's Hiſtory of the Reformation. He alſo, in 1691, addreſſed three letters in a 12mo. volume to biſhop Burnet, on his critique of Boſſuet's Hiſtory of the Variations of Proteſtant Churches. He was taken from his literary purſuits by the appointment of ſecretary to the abbé d'Eſtrees, in his embaſſy to Portugal, in 1692, which continued till 1697. Some tranſlations of Voyages and Travels from the Portugueſe were part of the fruits of this employ. In 1702 he accompanied the ſame miniſter to Spain, where he remained as ſecretary till 1704. The marquis de Torci, miniſter of ſtate, took him into his ſervice in 1705, and employed his pen in ſeveral memorials concerning the ſucceſſion to the Spaniſh monarchy, and other political topics, in which he acquitted himſelf with great ability. His laſt printed work was a treatiſe On the Succeſſion to the Crown of France, 1718, 12mo. which is reckoned a curious and uſeful performance. He died at the age of eighty, in 1733. He was poſſeſſed of two priories, and had been for a time cenſor-royal of books.

GRAND (Louis le), a learned French eccleſiaſtic, born at Luzigni, in the dioceſe of Autun, where he died in 1780. He was educated in the ſeminary of St. Sulpice, at Paris, and admitted to the degree of doctor by the faculty of the Sorbonne. The whole of his time which was not taken up in the diſcharge of his clerical functions he devoted to cloſe ſtudy. He publiſhed, 1. *Prælectiones Theologicæ de Deo*, in 2 vols. 12mo. 2. *De Incarnatione Verbi Divini*, in 2 vols. 12mo. 3. A treatiſe *De Eccleſia Chriſti*, 8vo. His writings are eſteemed for their perſpicuity, and the excellence of their arrangement.

GRAND, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Neufchateau: three leagues weſt of Neufchateau.

GRAND ANSE, or JEREMIE, a town in the weſtern part of the iſland of St. Domingo. The town is well built, but the road is ſo bad, that veſſels, to eſcape the wind, are compelled to take ſhelter behind cape Donna Maria.

GRAND ASSI'ZE, in law, a writ in a real action to determine the right of property in lands.

GRAND BAY, a bay on the ſouth coaſt of Newfoundland, a little to the ſouth of Cape Ray.

GRAND CA'PE, in law, a writ on plea of land, where the tenant makes default in appearance at the day given, for the king to take the land into his hands, &c. *Reg. Jud.* 1.

GRAND CHAMP, a town of France, in the department of the Morbihan, and chief place of a canton, in the diſtrict of Vannes: two leagues and a quarter north-north-weſt of Vannes, and two and a half north-eaſt of Auray.

GRAND DISTRESS', in law, a writ ſo called, becauſe the extent thereof is very great, being to all the goods and chattels of the party diſtrained within the county: it lies in two caſes, either when the tenant or defendant is attached, and appears not, but makes default; or where the tenant hath once appeared, and after makes default, then this writ is had by the common law, in lieu of a petit cape, by ſtat. Weſt. 1, c. 44. 52 *Hen.* III. c. 9.

GRAND FO'RO, a town of Africa, on the Slave Coaſt.

GRAND GUS'TO, among painters, a term uſed to expreſs, that in a picture there is ſomething very great and extraordinary, to ſurpriſe, pleaſe, and inſtruct.

GRAND I'SLAND, an iſland at the mouth of Lake Ontario, within the Britiſh territories, having Roebuck and Foreſt iſlands on the ſouth-weſt, and the Thouſand Iſles on the north-eaſt. It is twenty miles in length, and its greateſt breadth four miles.

GRAND I'SLAND, an iſland in Lake Superior, ſituated on the north ſide of the lake.

GRAND I'SLAND, an iſland in Niſagara river, about ſix miles long and three broad. The ſouth end is four miles north of Fort Erie; and its northern extremity three miles ſouth of Fort Sluſher, and fourteen ſouth of Niagara fort.

GRAND I'SLES, two large iſlands in Lake Champlain; each about ten miles long, and each forms a townſhip belonging to Vermont, in the American States.

GRAND JU'ROR, *ſ.* One of a grand jury.—You are *grand jurors*, are ye? *Shakeſpeare.*

GRAND JU'RY, in law, the jury that find bills of indictment before juſtices of peace, and of gaol-delivery, or oyer and terminer, &c. See the article JURY.

GRAND LAKE, a lake in the province of New Brunſwick, near the river St. John's, thirty miles in length, ten in breadth, and in ſome places forty fathoms deep.

GRAND MA'NAN, an iſland ſituated about ſix miles ſouth by ſouth-eaſt of Campo-Bello iſland, in the Atlantic Ocean, oppoſite to Paſſamaquoddy Bay, on the eaſtern border of the American States.

GRAND MAS'TER, *ſ.* The chief of the Teutonic order of knighthood.—The firſt *grand maſter* of the order was Henry Wallpot. *Cheſterfield.*

GRAND MAS'TERSHIP, *ſ.* Dignity of grand maſter.—He then quitted his *grand maſterſhip*. *Cheſterfield.*

GRAND RI'VER, a river of North America, which runs a north-weſt courſe into Lake Erie, twenty miles below the Forks, and eighty miles ſouth-weſt of Preſque Iſle.

GRAND SER'JEANTY, an ancient tenure by military ſervice. See the article TENURE.

GRAND SIGNOR', *ſ.* [Ital. great lord.] A title given to the emperor of the Turks.

GRAND SO'NE, a town of France, in the department of the Doubs; one league and a quarter eaſt of Beſançon, and two and a half north of Ornans.

GRAN'DAM, *ſ.* Grandmother; the father's or mother's mother:

Thy tigreſs heart belies thy angel face:
Too well thou ſhew'ſt thy pedigree from ſtone;
Thy *grandame*'s was the firſt by Pyrrha thrown. *Dryden.*

An old withered woman:

Cry'd, one and all, the ſuppliant ſhould have right,
And to the *grandame* hag adjudg'd the knight. *Dryden.*

GRAND'CHILD, *ſ.* The ſon or daughter of a ſon or daughter; one in the ſecond degree of deſcent.—Auguſtus Cæſar, out of indignation againſt his daughters and Agrippa his *grandchild*, would ſay that they were not his ſeed, but impoſthumes broken from him. *Bacon.*

He 'ſcaping with his gods and reliques fled,
And tow'rds the ſhore his little *grandchild* led. *Denham.*

GRANDCOU'R, a town of Swiſſerland, in the canton of Berne: ten miles weſt of Friburg.

GRANDCOU'RT, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Neufchatel: five leagues eaſt of Dieppe, and four north of Neufchatel.

GRAND'DAUGHTER, *ſ.* The daughter of a ſon or daughter.

GRAN'DE, *adj.* [Italian.] In muſic books, great, diſtinguiſhing the grand chords.

GRAN'DE, a town of Norway, in the dioceſe of Drontheim: twenty-eight miles north-weſt of Drontheim.

GRAN'DE, a river in South America, in Peru, near Cayanta; remarkable for its ſands enriched with gold duſt.

GRANDE RIVIE'RE, or Rio Grande, a river of Africa, which runs into the Atlantic, in lat. 11. N. lon. 13. 50. W. Greenwich.

GRANDE RIVIE'RE, a ſettlement in a hilly tract of the iſland of St. Domingo, or Hiſpaniola, ſix leagues and a half ſouth-weſt of Fort Dauphin, and four leagues and three quarters north-by-eaſt of St. Raphael, in that which was the Spaniſh part of the iſland. Lat. 19. 34. N. lon. 74. 30. W. from Paris.—Alſo the name of a ſmall river, in the ſame iſland, which riſes at Limonade, and empties into the ſea at Qr. Morin, five leagues eaſt of Cape François.

GRANDE RIVIE'RE, a river on the northern ſide of Chaleur Bay, about ſix leagues weſt-north-weſt of Cape Deſpair. Here is a fine cod fiſhery.

GRANDE SEAU'X, an Indian nation, in North America, who inhabit ſouth of the Miſſouri, and can furniſh 800 warriors.

GRANDEE', *ſ.* [*grand*, Fr. *grandis*, Lat.] A man of great rank, power, or dignity.—Some parts of the Spaniſh monarchy are rather for ornament than ſtrength: they furniſh out vice-royalties for the *grandees*, and poſts of honour for the noble families. *Addiſon.*

GRAN'DESHAGEN, a town of Germany, in the circle of Upper Saxony, in Pomerania: two miles north-weſt of Grieffenburg.

GRAN'DET (Joſeph), a pious French divine, born at Angers, in 1646. Having embraced the eccleſiaſtical life, he ſpent ſome years in the ſeminary of St. Sulpice, at Paris, whence he returned to his native place in 1674. He was there appointed ſuperior of the ſeminary in that city. In 1685 he was preſented to the church of the Holy Croſs at Angers, where he continued his miniſterial functions for thirty-two years, beloved and reſpected for his numerous acts of benevolence and charity. He died in 1724, in the ſeventy-ninth year of his age. He was the author of ſeveral lives of perſons eminent for their ſanctity, which have been much read by pious catholics.

GRANDEV'ITY, *ſ.* [from *grandævus*, Lat.] Great age; length of life.

GRANDE'VOUS, *adj.* [from *grandævus*, Lat.] Long-lived; of great age.

GRAN'DEUR, *ſ.* [French.] State; ſplendour of appearance; magnificence.—As a magiſtrate or great officer, he locks himſelf from all approaches by the multiplied formalities of attendance, by the diſtance of ceremony and *grandeur*. *South.*—Elevation of ſentiment, language, or mien.

The pleaſures which ariſe from the contemplation of objects in themſelves grand, awful, or ſublime, many diſtinguiſhed writers have attempted to explain; yet we are far from having attained to any preciſe ſyſtem on this intellectual ſpeculation. Mr. Addiſon appears to have been the firſt who attempted a regular enquiry on this ſubject, in his "Eſſay on the Pleaſures of the Imagination," publiſhed in the ſixth volume of the Spectator. His ſpeculations, if not exceedingly profound, are, however, very beautiful and entertaining; and he has the merit of having opened a track, which was before unbeaten. The advances made ſince his time in this philoſophical enquiry, are not very conſiderable. This is owing, doubtleſs, to that thinneſs and ſubtilty which are found to be properties in all the feelings of taſte. For inſtance; we all learn by experience, that certain figures of bodies appear to us more beautiful than others. On inquiring farther, we find that the regularity of ſome figures, and the graceful variety of others, are the foundation of the beauty or grandeur which we diſcern in them; but when we attempt to go a ſtep beyond this, and inquire what is the cauſe of regularity and variety producing in our minds the ſenſation of beauty or grandeur, any reaſon we can aſſign is extremely imperfect. Theſe firſt principles of internal ſenſation, nature ſeems to have covered with an impenetrable veil. But it affords ſome gratification to reflect, that although the efficient cauſe be obſcure, the final cauſe of thoſe ſenſations lies in many caſes more open: and, in contemplating the ſubject, we cannot avoid taking notice of the ſtrong impreſſion which theſe powers of taſte and imagination are calculated to give us of the benignity of our Creator. By endowing us with ſuch powers, he hath widely enlarged the ſphere of the pleaſures of human life; and thoſe too of a kind the moſt pure and innocent. The neceſſary purpoſes of life might have been abundantly anſwered, without conveying to us any of thoſe refined and delicate ſenſations of grandeur and ſublimity, with which we are now ſo much delighted. This additional embelliſhment, which, for promoting our entertainment, the Author of Nature hath poured forth upon his works, is one ſtriking teſtimony, among many others, of benevolence and goodneſs. This thought, which Mr. Addiſon firſt ſtarted, Dr. Akenſide, in his poem on the Pleaſures of the Imagination, has happily purſued;

——— Not content
With every food of life to nouriſh man,
By kind illuſions of the wandering ſenſe,
Thou mak'ſt all nature beauty to his eye
Or muſic to his ear.———

The pleaſures which ariſe from ſublimity or grandeur, appear to have a character more diſtinctly marked than any other of the pleaſures of the imagination; and here we might conſider grandeur and ſublimity as terms ſynonymous, or nearly ſo. If there be any diſtinction between them, it ariſes from ſublimity's expreſſing grandeur in a ſuperlative degree. It is not perhaps eaſy to deſcribe the preciſe impreſſion which grand and ſublime objects make upon us, when we behold them; but every one has a conception of it. It produces a ſort of internal elevation and expanſion of thought; it raiſes the mind much above its ordinary ſtate; and fills it with a degree of wonder and aſtoniſhment, which it cannot well expreſs. The emotion is always delightful; but it is altogether of the ſerious kind: a degree of awfulneſs and ſolemnity, even approaching to ſeverity, commonly attends it when at its height; very diſtinguiſhable from the more gay and ſprightly emotion raiſed merely by beautiful objects.

The ſimpleſt form of external grandeur appears in the vaſt and boundleſs proſpects preſented to us by nature; ſuch as wide extended regions, to which the eye can ſee no limits; the firmament of heaven; or the boundleſs expanſe of the ocean. All vaſtneſs produces the impreſſion of ſublimity. It is to be remarked however, that ſpace extended in length makes not ſo ſtrong an impreſſion as height or depth. Though a boundleſs plain be a grand object, yet a high mountain to which we look up, or an awful precipice or impending cliff, whence we look down on the objects below, is ſtill more ſo. The exceſſive grandeur of the firmament of heaven ariſes from its height joined to its boundleſs extent; and that of the ocean, not from its extent alone, but from the perpetual motion and irreſiſtible force of that vaſt abyſs of waters. Wherever ſpace is concerned, it is clear that amplitude or greatneſs of extent, in one dimenſion or other, is neceſſary to grandeur. Remove all bounds from any object, and you preſently render it ſublime. Hence infinite ſpace, endleſs numbers, and eternal duration, fill the mind with ſublime ideas.

From this fact, ſome have imagined that vaſtneſs, or amplitude of extent, is the foundation of all ſublimity. But this cannot be, becauſe many objects appear ſublime which have no relation to ſpace at all. Such, for inſtance, is great loudneſs of ſound. The burſt of thunder or of cannon, the roaring of winds, the ſhouting of multitudes, the ſound of vaſt cataracts of water, are all inconteſtibly grand objects. "I heard the voice of a great multitude, as the ſound of many waters and of mighty thunderings, ſaying Allelujah." In general we may obſerve, that great power and force exerted, always raiſe ſublime ideas; and perhaps the moſt copious ſource of theſe is derived from this quarter. Hence the grandeur of earthquakes and burning mountains; of great conflagrations; of the ſtormy ocean, and overflowing waters; of tempeſts of wind; of thunder and lightning; and of all the uncommon concuſſions of the elements. Nothing is more ſublime than mighty power and ſtrength. A ſtream that runs within its banks, is a beautiful object; but when it ruſhes down with the impetuoſity and roar of a torrent, it becomes a ſublime one. From lions, and other animals of ſtrength, are drawn ſublime compariſons in poetry. A race-horſe is looked upon with pleaſure; but it is the war-horſe, "whoſe neck is clothed with thunder," that carries grandeur in its idea. The engagement of two great armies, as it is the higheſt exertion of human might, combines a variety of ſources of the ſublime; and has accordingly been conſidered as one of the moſt ſtriking and magnificent ſpectacles that can be either preſented to the eye, or exhibited to the imagination by deſcription.

All ideas of an awful and ſolemn deſcription, or even bordering on the terrible, tend greatly to heighten the ſublime; ſuch as darkneſs, ſolitude, and ſilence. What are the ſcenes of nature that elevate the mind in the higheſt degree, and produce the ſublime ſenſation? Not the gay landſcape, the flowery field, or the flouriſhing city; but the hoary mountain, and the ſolitary lake; the aged foreſt, and the torrent foaming over the rock. Hence too, night-ſcenes are commonly the moſt ſublime. The firmament when filled with ſtars, ſcattered in ſuch vaſt numbers and with ſuch magnificent profuſion, ſtrikes the imagination with a more awful grandeur than when we view it enlightened with all the ſplendour of the mid-day ſun. The deep ſound of a great bell, or the ſtriking of a great clock, are at any time grand; but, when heard amid the ſilence and ſtillneſs of the night, they become doubly ſo. Darkneſs is very commonly applied for adding ſublimity to all our ideas of the Deity. "He maketh darkneſs his pavilion; he dwelleth in the thick cloud." So Milton:

——How oft, amidſt
Thick clouds and dark, does heaven's all-ruling Sire
Chuſe to reſide, his glory unobſcur'd,
And, with the majeſty of darkneſs, round
Circles his throne—— Book ii. 263.

With wonderful art Virgil has worked up all thoſe ideas of ſilence, vacuity, and darkneſs, when he is going to introduce his hero to the infernal regions, and to diſcloſe the ſecrets of the great deep:

Dii quibus imperium eſt animarum, umbræque ſilentes,
Et Chaos, et Phlegethon, loca nocte ſilentia latè,
Sit mihi fas audita loqui; ſit numine veſtro
Pandere res altâ terrâ, et caligine merſas.
Ibant obſcuri, ſola ſub nocte, per umbram,
Perque domos Ditis vacuos, et inania regna;
Quale per incertam lunam, ſub luce maligna
Eſt iter in ſylvis——

Ye ſubterranean gods, whoſe awful ſway
The gliding ghoſts and ſilent ſhades obey;
O Chaos hoar! and Phlegethon profound!
Whoſe ſolemn empire ſtretches wide around!
Give me, ye great tremendous powers! to tell
Of ſcenes and wonders in the depth of hell;
Give me your mighty ſecrets to diſplay,
From thoſe black realms of darkneſs to the day. *Pitt.*
Obſcure they went; through dreary ſhades, that led
Along the waſte dominions of the dead;
As wander travellers in woods by night,
By the moon's doubtful and malignant light. *Dryden.*

Obſcurity, we might alſo remark, is not unfavourable to ſublime ideas. Though it render the object indiſtinct, the impreſſion may nevertheleſs be great; for it is one thing to make an idea clear, and another to make it affecting to the imagination; and the imagination may be ſtrongly affected, and in fact often is ſo, by objects of which we have no clear conception. Thus we ſee, that almoſt all the deſcriptions given us of the appearances of ſupernatural beings carry ſome ſublimity, though the conceptions which they afford us be confuſed and indiſtinct. Their ſublimity ariſes from the ideas, which they always convey, of ſuperior power and might joined with an awful obſcurity. We may ſee this fully exemplified in the following noble paſſage of the book of Job: "In thoughts from the viſions of the night, when deep ſleep falleth upon men, fear came upon me, and trembling, which made all my bones to ſhake. Then a ſpirit paſſed before my face; the hair of my fleſh ſtood up: it ſtood ſtill; but I could not diſcern the form thereof; an image was before mine eyes; there was ſilence; and I heard a voice—Shall mortal man be more juſt than God?" (Job, iv. 15.) No ideas, it is plain, are ſo ſublime as thoſe taken from the Supreme Being; the moſt unknown, but the greateſt, of all objects; the infinity of whoſe nature, and the eternity of whoſe duration, joined with the omnipotence of his power, though they ſurpaſs our conceptions, yet exalt them to the higheſt. In general, all objects that are greatly raiſed above us, or far removed from us either in ſpace or in time, are apt to ſtrike us as great. Our viewing them, as through the miſt of ſuperſtition or antiquity, is favourable to the impreſſions of their ſublimity.

The picture which Lucretius has drawn of the dominion of ſuperſtition over mankind, repreſenting it as a portentous ſpectre ſhowing its head from the clouds, and diſmaying the whole human race with its countenance, together with the magnanimity of Epicurus in raiſing himſelf up againſt it, carries all the grandeur of a ſublime, *obſcure*, and awful, image:

Humana ante oculos fœde cum vita jaceret
In terris, oppreſſa gravi ſub religione,
Quæ caput a cœli regionibus oſtendebat,
Horribili ſuper aſpectu mortalibus inſtans,
Primum Graius homo mortales tollere contra
Eſt oculos auſus.— Lib. I.

As obſcurity, ſo *diſorder*, too, is very compatible with grandeur; nay, frequently heightens it. Few things that are ſtrictly regular, and methodical, appear ſublime. We ſee the limits on every ſide; we feel ourſelves confined; there is no room for the towering exertion of the mind. Exact proportion of parts, though it enters often into the beautiful, is much diſregarded in the ſublime. A huge maſs of rocks, thrown together by the hand of nature with wildneſs and confuſion, ſtrike the mind with more grandeur, than if they had been adjuſted or laid together with the moſt accurate ſymmetry. In the boldeſt attempts which human art can make towards producing grand objects, greatneſs of dimenſions always conſtitutes a principal part. No pile of building can convey any idea of ſublimity, unleſs it be majeſtic and lofty. There is, too, in architecture, what is called greatneſs of manner; which ſeems chiefly to ariſe, from preſenting the object to us in one full point of view; ſo that it ſhall make its impreſſion whole, entire, and undivided, upon the mind. A Gothic cathedral raiſes ideas of grandeur

by

by its ſize, its height, its awful ſolemnity, its ſtrength, its antiquity, and its durability. No perſon can enter the cathedrals of York, of Durham, or Wincheſter, without being forcibly ſtruck with theſe ſenſations.

There ſtill remains to be mentioned one claſs of grand or ſublime objects, which may be called the moral or ſentimental ſublime; ariſing from certain exertions of the human mind; from certain affections, and actions, of our fellow-creatures. Theſe will be found to be all, or chiefly, of that claſs, which comes under the name of *magnanimity* or *heroiſm*; and they produce an effect extremely ſimilar to what is produced by the view of grand objects in nature; filling the mind with admiration, and elevating it above itſelf. A noted inſtance of this, quoted by all the French critics, is the celebrated *Qu'il mourut* of Corneille, in the tragedy of *Horace*. In the famous combat betwixt the Horatii and Curiatii, the old Horatius, being informed that two of his ſons are ſlain, and that the third had betaken himſelf to flight, at firſt will not believe the report; but being thoroughly aſſured of the fact, is fired with all the ſentiments of high honour and indignation at this ſuppoſed unworthy behaviour of his ſurviving ſon. He is reminded, that his ſon ſtood alone againſt three, and aſked what he wiſhed him to have done?—"To have died,"—he anſwers. In the ſame manner Porus, taken priſoner by Alexander, after a gallant defence, and aſked how he wiſhed to be treated? anſwering, "Like a king;" and Cæſar chiding the pilot who was afraid to ſet out with him in a ſtorm, "Quid times? Cæſarem vehis;" are extraordinary inſtances of this ſentimental ſublime. Wherever, in ſome perilous and high ſituation, we behold a man uncommonly intrepid, and reſting upon himſelf; ſuperior to paſſion and to fear; animated by ſome great principle to the contempt of popular opinion, of ſelfiſh intereſt, of dangers, or of death; there we are ſtruck with the ſenſe of the grand and ſublime.

High virtue is above all others the moſt natural and fertile ſource of moral ſublimity. However, on ſome occaſions, where virtue either has no place, or is but imperfectly diſplayed, yet if extraordinary vigour and force of mind be diſcovered, we are not inſenſible to a degree of grandeur in the character; and from the ſplendid conqueror, or the daring conſpirator, whom we are far from approving, we cannot withhold our admiration. The ſublime, in natural and in moral objects, is brought before us in one view, and compared together, in the following beautiful paſſage of Akenſide's Pleaſures of the Imagination:

Look then abroad through nature; to the range
Of planets, ſuns, and adamantine ſpheres,
Wheeling, unſhaken, through the void immenſe;
And ſpeak, O man! does this capacious ſcene,
With half that kindling majeſty, dilate
Thy ſtrong conception, as when Brutus roſe
Refulgent, from the ſtroke of Cæſar's fate,
Amid the crowd of patriots; and his arm
Aloft extending, like eternal Jove,
When guilt brings down the thunder, call'd aloud
On Tully's name, and ſhook his crimſon ſteel,
And bade the father of his country hail!
For lo! the tyrant proſtrate on the duſt;
And Rome again is free.— Book I.

Silius Italicus has endeavoured to give an auguſt idea of Hannibal, by repreſenting him as ſurrounded with all his victories, in the place of guards. One who had formed a deſign of aſſaſſinating him in the midſt of a feaſt, is thus addreſſed:

Fallit te, menſas inter quod credis inermem;
Tot belliis quæſita viro, tot cædibus, armat
Majeſtas æterna ducem. Si admoveris ora
Cannas, & Trebium ante oculos, Traſymenaque buſta
Et Pauli ſtare ingentem miraberis umbram.

A thought ſomewhat of the ſame nature occurs in a French author: "Il ſe cache; mais ſa réputation le découvre. Il marche ſans ſuite & ſans équipage; mais chacun, dans ſon eſprit, le met ſur un char de triomphe. On compte, en le voiant, les ennemis qu'il a vaincus, non pas les ſerviteurs qui le ſuivent. Tout ſeul qu'il eſt, on ſe figure, autour de lui, ſes vertus & ſes victoires qui l'accompagnent. Moins il eſt ſuperbe, plus il devient vénérable." *Oraiſon funebre de M. de Turenne, par M. Flechier.*—Both theſe paſſages are ſplendid, rather than ſublime. In the firſt, there is a want of juſtneſs in the thought; in the ſecond, of ſimplicity in the expreſſion.

A queſtion has ariſen, whether we are able to diſcover ſome one fundamental quality in which all theſe different objects agree, and which is the cauſe of their producing an emotion of the ſame nature in our minds? Various hypotheſes have been formed concerning this; but, hitherto, unſatisfactory. Some have imagined that amplitude, or great extent, joined with ſimplicity, is either immediately, or remotely, the fundamental quality of whatever is ſublime; but we have ſeen that amplitude is confined to one ſpecies of ſublime objects; and cannot, without violent ſtraining, be applied to them all. The admired author of "A Philoſophical Enquiry into the Origin of our Ideas of the Sublime and Beautiful," propoſes a formal theory upon this foundation, That terror is the ſource of the ſublime, and that no objects have this character, but ſuch as produce impreſſions of pain and danger. It is indeed true, that many terrible objects are highly ſublime; and that grandeur does not refuſe an alliance with the idea of danger. But though this is very properly illuſtrated by the author, yet he ſeems to ſtretch his theory too far, when he repreſents the ſublime as conſiſting *wholly* in modes of danger or of pain. For the proper ſenſation of ſublimity appears to be very diſtinguiſhable from the ſenſation of either of theſe; and, on ſeveral occaſions, to be entirely ſeparated from them. In many grand objects, there is no coincidence with terror at all; as in the magnificent proſpect of wide-extended plains, and of the ſtarry firmament; or in the moral diſpoſitions and ſentiments, which we view with high admiration; and in many painful and terrible objects alſo, it is clear, there is no ſort of grandeur. The amputation of a limb, or the bite of a viper, are exceedingly terrible; but are deſtitute of all claim whatever to ſublimity. We are inclined to think, that mighty force or power, whether accompanied with terror or not, whether employed in protecting or in alarming us, has a better title, than any thing that has yet been mentioned, to be the fundamental quality of the grand and ſublime; as, after the review which we have taken, there ſeems not to occur any ſublime object, into the idea of which, power, ſtrength, and force, either enter not directly, or are not, at leaſt, intimately aſſociated with the idea, by leading our thoughts to ſome aſtoniſhing or uncontroulable power, as concerned in the production of the object.

That which is termed grand or ſublime in writing or compoſition, is ſuch a deſcription of objects, or exhibition of ſentiments, that are in themſelves of ſuch a grand or ſublime nature, as ſhall fill the mind with ſtrong impreſſions of them. But there is another very indefinite, and therefore very improper, ſenſe, which has been often put upon it; as when it is applied to ſignify any remarkable excellency of compoſition; whether it raiſe in us the ideas of grandeur, or thoſe of gentleneſs, elegance, or any other ſort of beauty. In this ſenſe we ſhould agree with Bergerus, that Cæſar's Commentaries may be termed ſublime; and ſo may many ſonnets, paſtorals, and love elegies, as well as Homer's Iliad. But this evidently confounds the uſe of words; and marks no one eſſential ſpecies, or character, of compoſition whatever.

It may be obſerved, that the *ſublime* is too often uſed in this laſt ſenſe, even by the celebrated Longinus, in his

his treatiſe on this ſubject. Thus, many of the paſſages which he produces as inſtances of the ſublime, are merely elegant, without having the moſt diſtant relation to grandeur or ſublimity. He points out five ſources of the ſublime: the firſt is, boldneſs or grandeur in the thoughts; the ſecond, the pathetic; the third, the proper application of figures; the fourth, the uſe of tropes and beautiful expreſſions; the fifth, muſical ſtructure in the arrangement of words. This is rather the plan of one who would write a treatiſe of rhetoric, or of the beauties of writing in general; and not of the ſublime in particular. For of theſe five heads, only the two firſt, viz. boldneſs and grandeur of thought, have any relation to the ſublime; and, in ſome inſtances, the pathetic, or ſtrong exertions of paſſion: but tropes, figures, and muſical arrangement, have no more relation to the grand and ſublime, than to other kinds of elegant writing.

We are then to enquire, What is the proper and natural idea of the grand and ſublime in compoſition? The foundation of it muſt always be laid in the nature of the object deſcribed; unleſs it be ſuch an object as, if preſented to our eyes, and exhibited to us in reality, would raiſe ideas of that elevating, that awful and magnificent, kind, which we call ſublime: for the deſcription, however finely drawn, is not entitled to come under this claſs. In the next place, the object muſt not only, in itſelf, be ſublime, but it muſt be ſet before us in ſuch a light as is moſt proper to give us a clear and full impreſſion of it; it muſt be deſcribed with energy, with conciſeneſs, and ſimplicity. This depends, principally, upon the lively impreſſion which the poet, or orator, has of the object which he exhibits; and upon his being deeply affected, and warmed, by the grand idea which he would convey. If his own feeling be languid, he can never inſpire us with any ſtrong emotion. Inſtances, which are extremely neceſſary on this ſubject, will clearly ſhow the importance of all the requiſites now mentioned.

It is, generally ſpeaking, among the moſt ancient authors, that we are to look for the moſt ſtriking inſtances of grandeur and ſublimity in compoſition. The early ages of the world, and the rude unimproved ſtate of ſociety, are peculiarly favourable to the ſtrongeſt impreſſions upon the imagination. The genius of men ſeems then moſtly turned to admiration and aſtoniſhment. Meeting with many objects, to them new and ſtrange, their imagination is kept glowing, and their paſſions raiſed to the loftieſt ideas. They think, and expreſs themſelves boldly, and without reſtraint; while in the progreſs of ſociety, the genius and manners of men undergo a change much more favourable to literary accuracy than to grandeur or ſublimity.

Of all writings, ancient or modern, the ſacred ſcriptures afford us the grandeſt inſtances of the ſublime. The deſcriptions of the Deity, in them, are wonderfully noble; both from the grandeur of the object, and the manner of repreſenting it. What an aſſemblage, for inſtance, of awful and ſublime ideas is preſented to us, in that paſſage of the xviiith Pſalm, where an appearance of the Almighty is deſcribed? "In my diſtreſs I called upon the Lord; he heard my voice out of his temple, and my cry came before him. Then the earth ſhook and trembled; the foundations alſo of the hills were moved; becauſe he was wroth. He bowed the heavens, and came down, and darkneſs was under his feet; and he did ride upon a cherub, and did fly; yea, he did fly upon the wings of the wind. He made darkneſs his ſecret place; his pavilion round about him were dark waters, and thick clouds of the ſky." Here, we ſee, with what propriety and ſucceſs the circumſtances of darkneſs and terror are applied for heightening the ſublime. So, alſo, the prophet Habakkuk, in a ſimilar paſſage: "He ſtood, and meaſured the earth; he beheld, and drove aſunder the nations. The everlaſting mountains were ſcattered; the perpetual hills did bow; his ways are everlaſting. The mountains ſaw thee; and they trembled. The overflowing of the water paſſed by. The deep uttered his voice, and lifted up his hands on high."

The noted inſtance, given by Longinus, from Moſes, "God ſaid, Let there be light; and there was light;" belongs to the true ſublime; and the grandeur of it ariſes from the ſtrong conception it gives, of an exertion of power, producing its effect with the utmoſt ſpeed and facility. A thought of the ſame kind is magnificently expreſſed in the following paſſage of Iſaiah xliv. 24, 27, 28: "Thus ſaith the Lord, thy Redeemer, and he that formed thee from the womb: I am the Lord that maketh all things, that ſtretcheth forth the heavens alone, that ſpreadeth abroad the earth by myſelf—that ſaith to the deep, Be dry, and I will dry up thy rivers; that ſaith of Cyrus, He is my ſhepherd, and ſhall perform all my pleaſure; even ſaying to Jeruſalem, Thou ſhalt be built; and to the temple, Thy foundation ſhall be laid." There is alſo a paſſage in the Pſalms, which deſerves to be mentioned under this head; "God," ſays the pſalmiſt, "ſtilleth the noiſe of the ſeas, the noiſe of their waves, and the tumults of the people." The joining together two ſuch grand objects, as the ragings of the waters and the tumults of the people, between which there is ſo much reſemblance as to form a very natural aſſociation in the fancy, and the repreſenting them both as ſubject, at one moment, to the command of God, produces a very noble effect.

Homer, the prince of poets, owes much of his grandeur to that native and unaffected ſimplicity, which characteriſes his manner. His deſcriptions of hoſts engaging; the animation, the fire, and rapidity, which he throws into his battles, preſent to every reader of the Iliad, frequent inſtances of ſublime writing. His introduction of the gods, tends often to heighten, in a ſuperior degree, the majeſty of his warlike ſcenes. Hence Longinus beſtows ſuch high commendations on that paſſage, in the xvth book of the Iliad, where Neptune, when preparing to iſſue forth into the engagement, is deſcribed as ſhaking the mountains with his ſteps, and driving his chariot along the ocean. Minerva, arming herſelf for fight in the vth book; and Apollo, in the xvth, leading on the Trojans, and flaſhing terror with his ægis on the face of the Greeks, are ſimilar inſtances of great ſublimity added to the deſcription of battles, by the appearances of thoſe celeſtial beings. In the xxth book, where all the gods take part in the engagement, according as they ſeverally favour either the Grecians, or the Trojans, the poet's genius is ſignally diſplayed, and the deſcription riſes into the moſt awful magnificence. All nature is repreſented as in commotion. Jupiter thunders in the heavens; Neptune ſtrikes the earth with his trident; the ſhips, the city, and the mountains, ſhake; the earth trembles to its centre; Pluto ſtarts from his throne, in dread leſt the ſecrets of the infernal region ſhould be laid open to the view of mortals. The paſſage is worthy of being written in letters of gold:

Αυταρ επει μεθ' ομιλον Ολυμπιοι ηλυθον ανδρων,
Ωρτο δ' Ερις κρατερη, λαοσσοος· αυε δ' Αθηνη,—
Αυε δ' Αρης στερεωθεν, εφεμνη λαιλαπι ισος,—
Ως της αμφω εξος μαλλαρες θεοι στησαν ες,
Σημβλαν, εν δ' αυτοις εριδα ρηγνυντο βαρειαν·
Δεινον δ' εβρονησε πατης ανδρων τε θεων τε
Υψοθεν· αυταρ ενερθε Ποσειδαων ετιναξε
Γαιαν απειρεσιην, ορεων τ' αιπεινα καρηνα.
Παντες δ' εσσειουτο ποδες πολυπιδακος Ιδης,
Και κορυφαι, Τρωων τε πολις, και νηες Αχαιων.
Εδδεισεν δ' υπενερθεν αναξ ευρεων, Αιδωνευς,
Δεισας δ' εκ θρονου αλτο, και ιαχε· μη οι υπερθε
Γαιαν αναρρηξειε Ποσειδαων ενοσιχθων,
Οικια δε θνητοισι και αθανατοισι φανειη
Σμερδαλε', ευρωεντα, τα τε στυγεουσι θεοι περ'
Τοσσος αρα κτυπος ωρτο θεων εριδι ξυνιοντων. Iliad xx. 47, &c.

But when the powers deſcending ſwell'd the fight,
Then tumult roſe, fierce rage, and pale affright;
Now through the trembling ſhores Minerva calls,
And now ſhe thunders from the Grecian walls.
Mars hov'ring o'er his Troy, his terror ſhrouds
In gloomy tempeſts, and a night of clouds;
Now through each Trojan heart he fury pours,
With voice divine, from Ilion's topmoſt towers.——
Above, the Sire of Gods his thunder rolls,
And peals on peals redoubled rend the poles;
Beneath, ſtern Neptune ſhakes the ſolid ground,
The foreſts wave, the mountains nod around;
Through all her ſummits tremble Ida's woods,
And from their ſources boil her hundred floods:
Troy's turrets totter on the rocking plain,
And the toſs'd navies beat the heaving main:
Deep in the diſmal region of the dead,
Th' infernal monarch rear'd his horrid head,
Leapt from his throne, leſt Neptune's arm ſhould lay
His dark dominions open to the day;
And pour in light on Pluto's drear abodes,
Abhorr'd by men, and dreadful ev'n to gods.
Such wars th' immortals wage; ſuch horrors rend
The world's vaſt concave, when the gods contend. *Pope.*

The works of Oſſian alſo abound with examples of the grand and ſublime. The ſubjects of which that author treats, and the manner in which he writes, are particularly favourable to it. He deals in no ſuperfluous or gaudy ornaments; but throws forth his images with a rapid conciſeneſs, which enables them to ſtrike the mind with the greateſt force. Among poets of more poliſhed times, we are to look for the graces of correct writing, for juſt proportion of parts, and ſkilfully-conducted narration. In the midſt of ſmiling ſcenery and pleaſurable themes, the gay and the beautiful will undoubtedly appear to more advantage. But amidſt the rude ſcenes of nature and of ſociety, ſuch as Oſſian deſcribes; amidſt rocks, and torrents, and whirlwinds, and battles, dwells the ſublime; and naturally aſſociates itſelf with that grave and ſolemn ſpirit which diſtinguiſhes the author of Fingal. "As autumn's dark ſtorms pour from two echoing hills, ſo toward each other approached the heroes. As two dark ſtreams from high rocks meet and mix, and roar on the plain: loud, rough, and dark, in battle, met Lochlin and Inisfail; chief mixed his ſtrokes with chief, and man with man. Steel clanging ſounded on ſteel. Helmets are cleft on high; blood burſts, and ſmokes around. As the troubled noiſe of the ocean when roll the waves on high; as the laſt peal of the thunder of heaven; ſuch is the noiſe of battle. The groan of the people ſpread over the hills. It was like the thunder of night, when the cloud burſts on Cona, and a thouſand ghoſts ſhriek at once on the hollow wind." Never were images of more awful ſublimity employed to heighten the terror of battle.

In general, Engliſh verſe in rhyme appears to be, if not inconſiſtent with the ſublime, at leaſt very unfavourable to it. The conſtrained elegance of this kind of verſe, and the ſtudied ſmoothneſs of the ſounds, anſwering regularly to each other at the end of the line, though they be quite conſiſtent with gentle emotions, yet weaken the native grandeur and force of ſublimity; beſides, that the ſuperfluous words which the poet is often obliged to introduce, in order to fill up the rhyme, tend farther to enfeeble it. Homer's deſcription of the nod of Jupiter, as ſhaking the heavens, has been admired in all ages, as highly grand and ſublime. Literally tranſlated, it runs thus: "He ſpoke, and bending his ſable brows, gave the awful nod; while he ſhook the celeſtial locks of his immortal head, all Olympus was ſhaken."—Mr. Pope tranſlates it thus:

He ſpoke; and awful bends his ſable brows,
Shakes his ambroſial curls, and gives the nod,
The ſtamp of fate, and ſanction of a god.
High heaven with trembling the dread ſignal took,
And all Olympus to its centre ſhook

Here the image is ſpread out, and attempted to be beautified; but it is, in truth, weakened. The third line—"The ſtamp of fate, and ſanction of a god," is merely expletive; and introduced for no other reaſon but to fill up the rhyme; for it interrupts the deſcription, and clogs the image. For the ſame reaſon, out of mere compliance with the rhyme, Jupiter is repreſented as ſhaking his locks before he gives the nod;—"Shakes his ambroſial curls, and gives the nod," which is trifling, and without meaning. Whereas, in the original, the hair of his head ſhaken, is the effect of his nod, and makes a happy picturesque circumſtance in the deſcription. But on the other hand, the boldneſs, freedom, and variety, of our blank verſe, is infinitely more favourable than rhyme, to all kinds of ſublime poetry. The fulleſt proof of this is afforded by Milton; whoſe genius led him eminently to the grand and ſublime. The whole firſt and ſecond books of his Paradiſe Loſt are continued inſtances of it; one of the moſt ſtriking of which is, the deſcription of Satan after his fall, appearing at the head of the infernal hoſts:

——He, above the reſt,
In ſhape and geſture proudly eminent,
Stood like a tower: his form had not yet loſt
All her original brightneſs, nor appeared
Leſs than archangel ruined; and the exceſs
Of glory obſcured. As when the ſun, new riſen,
Looks through the horizontal miſty air,
Shorn of his beams; or, from behind, the moon,
In dim eclipſe, diſaſtrous twilight ſheds
On half the nations, and with fear of change
Perplexes monarchs——Darken'd ſo, yet ſhone
Above them all th' archangel.——

Here concur a variety of ſources of the grand and ſublime: the principal object eminently great; a high ſuperior nature, fallen indeed, but erecting itſelf againſt diſtreſs; the grandeur of the principal object heightened, by aſſociating it with ſo noble an idea as that of the ſun ſuffering an eclipſe; this picture, ſhaded with all thoſe images of change and trouble, of darkneſs and terror, which coincide ſo finely with the ſublime emotion; and the whole expreſſed in a ſtyle and verſification, eaſy, natural, and ſimple, yet very magnificent.

Strength of deſcription is in all caſes highly expedient; and this generally follows from a ſimple conciſeneſs; but, it ſuppoſes alſo ſomething more; namely, a proper choice of circumſtances in the deſcription, ſo as to exhibit the object in its full and moſt elevated point of view. For every object has ſeveral faces, ſo to ſpeak, by which it may be preſented to us, according to the circumſtances with which we ſurround it; and it will appear eminently ſublime, or not, in proportion as all theſe circumſtances are happily choſen. Herein lies the great art of the writer; and indeed, the great difficulty of ſublime compoſition. If the deſcription be too general, and diveſted of circumſtances, the object appears in a faint light; it makes a feeble impreſſion, or no impreſſion at all, on the reader. At the ſame time, if any trivial or improper circumſtances are mingled, the whole becomes degraded.

A ſtorm or tempeſt, for inſtance, is a grand object in nature. But, to render it ſublime in deſcription, it is not enough, either to give us mere general expreſſions concerning the violence of the tempeſt, or to deſcribe its common effects in overthrowing trees and houſes. It muſt be painted with ſuch circumſtances as fill the mind with great and awful ideas. This is moſt happily effected by Virgil, in the following paſſage:

Ipſe Pater, media nimborum in nocte, coruſcâ
Fulmina moliter dextrâ; quo maxima motu
Terro tremit; fugere feræ; et mortalia corda,
Per gentes humilis ſtravit pavor. Ille, flagranti
Aut Atho, aut Rhodopen, aut alta Ceraunia telo
Dejicit.—— GEORG. I.

The Father of the Gods his glory ſhrouds,
Involv'd in tempeſts, and a night of clouds:
And from the middle darkneſs flaſhing out,
By fits he deals his fiery bolts about.
Earth feels the motions of her angry god,
Her entrails tremble, and her mountains nod,
And flying beaſts in foreſts ſeek abode.
Deep horror ſeizes every human breaſt;
Their pride is humbled, and their fears confeſt;
While he, from high, his rolling thunder throws,
And fires the mountains with repeated blows;
The rocks are from their old foundations rent;
The winds redouble, and the rains augment. *Dryden.*

Every circumſtance in this noble deſcription is the production of an imagination heated and aſtoniſhed with the grandeur of the object. If there be any defect, it is in the words immediately following thoſe quoted; "Ingeminant Auſtri, et denſiſſimus imber;" where the tranſition appears to be made too haſtily from the preceding ſublime images, to a thick ſhower, and the blowing of the ſouth wind; which ſhews how difficult it is to deſcend with grace, without ſeeming to fall.

The high importance of a proper choice of circumſtances, when a deſcription is meant to be ſublime, ſeems not to have been ſufficiently attended to. It has, however, ſuch a foundation in nature, as renders the leaſt deflexion from it fatal. When a writer is aiming at the beautiful only, his deſcriptions may have improprieties in them, and yet be beautiful ſtill. Some trivial or miſjudged circumſtances can be overlooked by the reader; they make only the difference of more or leſs; the gay, or pleaſing, emotion, which he has raiſed, ſubſiſts ſtill. But the caſe is quite different with the ſublime. There, one trifling circumſtance, one mean idea, is ſufficient to deſtroy the whole charm. This is owing to the nature of the emotion aimed at by ſublime compoſition, which admits of no mediocrity, and cannot ſubſiſt in a middle ſtate; but muſt either highly tranſport us, or, if unſucceſsful in the execution, leave us greatly diſguſted, and diſpleaſed. We attempt to riſe along with the writer; the imagination is awakened, and put upon the ſtretch; but it requires to be ſupported; and if, in the midſt of its efforts, you deſert it unexpectedly, down it comes, with a painful ſhock. When Milton, in his battle of the angels, deſcribes them as tearing up the mountains, and throwing them at one another; there are, in his deſcription, as Mr. Addiſon has obſerved, no circumſtances but what are properly ſublime:

From their foundations loos'ning to and fro,
They pluck'd the ſeated hills, with all their load,
Rocks, waters, woods; and by the ſhaggy tops
Uplifting, bore them in their hands.——

Whereas Claudian, in a fragment upon the wars of the giants, has contrived to render this idea of their throwing the mountains, in itſelf ſo grand, quite burleſque and ridiculous; by this ſingle circumſtance, of one of his giants with the mountain Ida upon his ſhoulders, and a river, which flowed from the mountain, running down along the giant's back, as he held it up in that poſture. There is a deſcription too in Virgil, which is cenſurable, though more ſlightly, in this reſpect. It is that of the burning mountain Ætna; a ſubject certainly very proper to be worked up by a poet into a ſublime deſcription:

——Horrificis juxta tonat Ætna ruinis.
Interdumque atram prorumpit ad æthera nubem,
Turbine fumantem piceo, & candente favilla;
Attollitque globos flammarum, & ſidera lambit.
Interdum ſcopulos, avulſaque viſcera montis
Erigit eructans, liquefactaque ſaxe ſub auras
Cum genitu glomerat, fundoque exæſtuat imo.
ÆN. III. 571.

The port capacious, and ſecure from wind,
Is to the foot of thundering Ætna join'd.
By turns a pitchy cloud ſhe rolls on high,
By turns hot embers from her entrails fly,
And flakes of mounting flames that lick the ſky.
Oft from her bowels maſſy rocks are thrown,
And ſhiver'd by the force, come piece-meal down.
Oft liquid lakes of burning ſulphur flow,
Fed from the fiery ſprings that boil below. *Dryden.*

In the tranſlation of Dryden, the debaſing circumſtance objected to in the original, is, with propriety, omitted. This debaſement lies here: that after ſeveral magnificent images, the poet concludes with perſonifying the mountain, under this figure, "eructans viſcera cum gemitu," belching up its bowels with a groan; which, by likening the mountain to a ſick or drunken perſon, degrades the majeſty of the deſcription. It is to no purpoſe to tell us, that the poet here alludes to the fable of the giant Enceladus lying under mount Ætna; and that he ſuppoſes his motions and toſſings to have occaſioned the fiery eructations. He intended the deſcription of a ſublime object; and the natural ideas, raiſed by a burning mountain, are infinitely more lofty than the belchings of a giant, how huge ſoever.

From the account here given of the nature of the grand or ſublime, it clearly follows, that it is an emotion which can never be long protracted. The mind, by no force of genius, can be kept, for any conſiderable time, ſo far raiſed above its uſual balance; but will, of courſe, relax into its ordinary ſituation. Neither are the abilities of any human writer ſufficient to furniſh a long continuation of uninterrupted ſublime ideas. The utmoſt we can expect is, that this fire of imagination ſhould ſometimes flaſh upon us like lightning, and then diſappear. In Homer and Milton, this effulgence of genius breaks forth more frequently, and with greater luſtre, than in moſt other authors. Shakeſpeare alſo riſes often into the true ſublime. But no author whatever is ſublime throughout. Some, indeed, there are, who, by a ſtrength and dignity in their conceptions, and a current of lofty ideas, preſerve the reader's mind always in a tone nearly allied to the ſublime; for which reaſon they may, in a limited ſenſe, merit the name of ſublime writers; and in which claſs we may juſtly place Demoſthenes and Plato.

Some writers are apt to imagine, that magnificent words, accumulated epithets, and a certain ſwelling tone of expreſſion, by riſing above what is uſual or vulgar, contributes to, or even forms, the ſublime. Nothing can be more erroneous. In all the inſtances of ſublime writing here given, nothing of this kind appears. In general, in all good writing, the ſublime lies in the thought, not in the words; and when the thought is truly noble, it will, for the moſt part, clothe itſelf in dignity of language. The ſublime, indeed, rejects mean, low, or trivial, expreſſions; but it is equally an enemy to ſuch as are turgid. The main ſecret of being ſublime, is to ſay great things in few and plain words. It will be found to hold, without exception, that the moſt ſublime authors are the ſimpleſt in their ſtyle; and wherever we find a writer, who affects a more than ordinary pomp and parade of words, and is always endeavouring to magnify his ſubject by epithets, there we may ſuſpect, that, feeble in ſentiment, he is ſtudying to ſupport himſelf by mere expreſſion.

The ſame unfavourable judgment we muſt paſs on all that laboured apparatus with which ſome writers introduce a paſſage, or deſcription, which they intend ſhall be ſublime; calling on their readers to attend, invoking their muſe, or breaking forth into general, unmeaning, exclamations, concerning the greatneſs, terribleneſs, or majeſty, of the object which they are to deſcribe. Mr. Addiſon, in his "Campaign," has fallen into an error of this kind, when about to deſcribe the battle of Blenheim:

But

But O! my muſe! what numbers wilt thou find
To ſing the furious troops in battle join'd?
Methinks, I hear the drums tumultuous ſound,
The victor's ſhouts, and dying groans, confound; &c.

Introductions of this ſort, are a forced attempt in a writer, to ſpur up himſelf, and his reader, when he finds his imagination begin to flag. It is like taking artificial ſpirits in order to ſupply the want of ſuch as are natural. Yet Mr. Addiſon's Campaign is far from wanting merit; and, in particular, the compariſon of his hero to the angel who rides in the whirlwind and directs the ſtorm, is a truly ſublime image.

The faults oppoſite to the grand and ſublime, are the frigid, and the bombaſt. The frigid conſiſts, in degrading an object, or ſentiment, which is ſublime in itſelf, by a mean conception of it; or by a weak, low, and childiſh, deſcription of it. This generally betrays great poverty of genius. Of this, there are too many examples in different writers.—The bombaſt lies, in forcing a trivial object out of its rank, and endeavouring to raiſe it into the ſublime; or, in attempting to exalt a grand object beyond all natural and reaſonable bounds. Into this error, which is alſo too common, writers of genius may ſometimes fall, by unluckily loſing ſight of the true principles of grandeur and ſimplicity.—See Addiſon's Spectator; Akenſide's Pleaſures of the Imagination; Webb on the Beauties of Poetry; Gerard on Taſte; Blair's Lectures on Rhetoric, &c.

GRAND'FATHER, *ſ.* The father of my father or mother; the next above my father or mother in the ſcale of aſcent.—Our grandchildren will ſee a few rags hung up in Weſtminſter-hall, which coſt an hundred millions, whereof they are paying the arrears, and boaſt that their *grandfathers* were rich and great. *Swift.*

GRAND'FATHERS, ſeveral large detached mountains in the ſouth-eaſt corner of Tenneſſee, belonging to the American States; in which are the head waters of French, Broad, and Cataba rivers.

GRAN'DI (Francis-Louis), an Italian abbot, philoſopher, and mathematician, born at Cremona in 1671. As he early poſſeſſed a ſtudious inclination, he determined to embrace the eccleſiaſtical life for the ſake of freely indulging it. Accordingly, when he was about ſixteen years of age, he entered into the order of Camaldolites, at Ravenna; on which occaſion, in compliance with the uſage of the order, he relinquiſhed his chriſtian name and received that of *Guy*. He ſoon diſtinguiſhed himſelf by his proficiency in the different branches of literature and ſcience; and becoming in the courſe of his enquiries diſſatisfied with the peripatetic philoſophy which then prevailed in the ſchools, he was ambitious of contributing to introduce a more rational ſyſtem. With this deſign he offered himſelf a candidate for a vacant chair of philoſophy in the univerſity of Florence, and obtained his object. In this ſituation he diligently applied himſelf to exterminate the Ariſtotelian dogmas, and to introduce in their room the philoſophy of Deſcartes; while at the ſame time he became zealouſly attached to mathematical ſtudies. Having publiſhed a treatiſe intended to reſolve the problems of Viviani, relative to the conſtruction of arches, which he dedicated to the grand-duke Coſmo III. that prince was ſo well pleaſed with it, that he appointed him profeſſor of philoſophy in the univerſity of Piſa. From this time father Grandi applied cloſely to the ſtudy of pure mathematics; and he had the honour of ranking among his friends and correſpondents Leibnitz, Newton, Bernouilli, Baglivi, and Magalotti. Yet in the midſt of his ſcientific ſtudies he paid due attention to hiſtory, criticiſm, and eccleſiaſtical antiquities. In 1683, Dr. Narciſſus Marſh, archbiſhop of Armagh, having preſented to the royal ſociety in Dublin ſome difficult problems for the improvement of acouſtics, father Grandi was requeſted, by his friend count Laurence Magalotti, to reſolve them; which taſk he accompliſhed; and his performance was tranſmitted by the Britiſh miniſter at the court of Florence to the royal ſociety at London. One of his principal works was, On Series and Infiniteſimals. Father Grandi's talents were alſo employed on matters of political economy. To him were referred various diſputes reſpecting the rights of fiſhery and tolls on the rivers; and he was employed in a joint commiſſion from the grand-duke and the court of Rome to ſettle the differences between the inhabitants of Ferrara and Bologna, concerning the neceſſary works to preſerve their territories from inundation. Theſe ſervices he performed to the ſatisfaction of all parties. He died in 1742, when ſeventy-two years of age.

GRANDI'ER (Urban), a French prieſt, who was condemned for the pretended crime of magic, and burnt alive, in 1634. He was the ſon of a notary-royal at Sablé, and born at Bovere, near that town. He was educated under the Jeſuits at Bourdeaux, and ſoon recommended himſelf to notice by the dawnings of a fine genius, and his proficiency in his ſtudies. On appreciating his talents, the ſociety collated him to the living of St. Peter at Loudun; and alſo procured for him a prebend in the church of the Holy Croſs. Theſe benefices made him the object of envy with the eccleſiaſtics, which was ſtill farther heightened by his great accompliſhments. He often appeared in the pulpit, where his talents as a preacher procured him numerous admirers. His ruin, however, was ſoon decided upon by the college of monks; and they deviſed a ſcheme for engaging cardinal Richelieu, the prime miniſter, to favour their deſigns. For this purpoſe the capuchins of Loudun wrote to father Joſeph, one of their fraternity, whom the cardinal had aſſociated with himſelf in the adminiſtration, informing him that Grandier was the author of a ſatirical libel, entitled, The Shoemaker's Wife of Loudun, containing reflections on the cardinal's perſon and birth, which had excited in his boſom the ſharpeſt ſtings of reſentment. Suffering himſelf to be perſuaded that this information was well founded, he determined to make Grandier feel the weight of his vengeance. At that time M. Laubardemont, maſter of the requeſts, was commiſſioned by the king to demoliſh the fortifications of Loudun. This man was entirely devoted to the cardinal, and the ordinary inſtrument of his vengeance when that miniſter was diſpoſed to put any perſon to death under the formal ſhow of juſtice. To him the cardinal wrote, giving him ſufficient intimations that he wiſhed the deſtruction of Grandier. Laubardemont immediately ordered the unhappy prieſt to be impriſoned; and after waiting upon the cardinal to concert with him the manner of his future proceedings, received a commiſſion to carry on a proceſs againſt Grandier for ſorcery. This commiſſion was directed to M. Laubardemont, and to twelve judges of the courts in the neighbourhood of Loudun. After a tedious proceſs, in which the farce of exorciſing the poſſeſſed was ſeveral times repeated, and Laubardemont's tyranny diſplayed in the moſt glaring light, "upon the depoſition of Aſhtaroth, a devil of the order of Seraphim, and the chief of the poſſeſſing devils, and of Eaſas, Celſus, Acaos," &c. the commiſſioners gave judgment, declaring Grandier "duly attainted and convicted of the crime of magic, ſorcery, and poſſeſſion happening by his means in the perſons of ſome of the Urſuline nuns of Loudun, &c. for the reparation of which he was condemned to be burnt alive with the magical pacts and characters, &c." Grandier heard this ſentence without any emotion, and afterwards ſuſtained the torture with aſtoniſhing fortitude, not ſuffering one repining expreſſion againſt his enemies to eſcape him throughout the whole ſcene; and, being brought to the ſtake, he expired amidſt the flames with unabated courage, commending himſelf to the divine mercy in the

the laſt words he was able to utter. A curious relation of his caſe may be ſeen in the Hiſtory of the Devils of Loudun, firſt publiſhed at Amſterdam in 1693, and frequently reprinted. The only compoſition of his which has been publiſhed is, A Funeral Oration for Scævola de St. Martha, which is highly commended for the ſtrokes of eloquence with which it is interſperſed, and is printed among the works of that author.

GRANDIF'IC, *adj.* [*grandis* and *facio*, Lat.] Making great.

GRANDIL'OQUENCE, *ſ.* [from the Lat. *grandis*, great, and *loquor*, to ſpeak.] A lofty ſtyle; a ſuperb manner of expreſſion. *Scott. Not much uſed.*

GRANDIL'OQUENT, *adj.* Uſing lofty ſtyle; ſpeaking in a ſuperb manner. *Cole.*

GRANDIL'OQUOUS, *adj.* Uſing a lofty ſtyle; ſpeaking in a ſuperb manner. *Cole.*

GRANDIL'OQUY, *ſ.* A lofty ſtyle; a ſuperb manner of ſpeaking. *Cole.*

GRAN'DIN (Martin), a learned French theological profeſſor, born at St. Quintin in 1604. He was inſtructed in grammar learning at Noyon and Amiens, and when he was ſeventeen years old was ſent to Paris, where he ſtudied theology under father Le Mairat, a Jeſuit. Afterwards he became a member of the college of cardinal Le Moine, where for ſome time he filled the chair of philoſophical profeſſor. He was next received into the ſociety of the Sorbonne, and having taken orders, devoted ſeveral years to the exerciſe of the paſtoral functions. His learning and talents occaſioned the laſt-mentioned faculty to recal him into their body in 1638, and to appoint him to the poſt of profeſſor of divinity. The duties of this office he diſcharged for more than fifty years with great reputation, and died in 1691, when about eighty-ſeven years of age. He had been admitted by the Sorbonne to the degree of doctor. He left behind him a ſyſtem of divinity, which was publiſhed after his death by M. du Pleſſis d'Argentré, in 1710 and 1712, under the title of, *Opera Theologica*, &c. in 6 vols. 4to. which met with a favourable reception from the public.

GRAN'DINOUS, *adj.* [*grando*, Lat.] Full of hail; conſiſting of hail.

GRANDI'SONOUS, *adj.* [*grandiſonus*, Lat.] Making a great ſound.

GRAN'DITY, *ſ.* [from *grandis*, Lat.] Greatneſs; grandeur; magnificence. *An old word.*—Our poets excel in *grandity* and gravity, ſmoothneſs and property, in quickneſs and briefneſs. *Camden.*

GRANDLUCE', a town of France, in the department of the Sarte, and chief place of a canton, in the diſtrict of Chateau-du-Lois: fourteen miles ſouth-eaſt of Le Mans.

GRANDMO'NT, a town of France, in the department of the Upper Vienne: near which was a celebrated abbey, ſuppreſſed in 1769, after the death of the then profeſſed members: five leagues north-eaſt of Limoges.

GRAND'MOTHER, *ſ.* The father's or mother's mother.—Thy *grandmother* Lois, and thy mother Eunice. 1 *Tim.* i. 5.

GRANDO'LA, a town of Portugal, in the province of Eſtremadura: nine leagues ſouth-eaſt of Setuval.

GRANDPRE', a town of France, and principal place of a diſtrict, in the department of the Ardennes: eleven leagues eaſt of Reims, and nine ſouth-ſouth-eaſt of Mezieres. Here the French army commanded by general Dumourier, on the 14th of September 1794, was attacked by the duke of Brunſwick, and compelled to retreat to St. Menehould. Lat. 49. 20. N. lon. 22. 32. E. Ferro.

GRANDRIEU'X, a town of France, in the department of the Lozere, and chief place of a canton, in the diſtrict of Langogne: three leagues and a half north-weſt of Langogne, and five eaſt of St. Chely.

GRAND'SIRE, *ſ.* Grandfather:

Think'ſt thou, that I will leave my kingly throne,
Wherein my *grandſire* and my father ſat? *Shakeſpeare.*

Any anceſtor, poetically:

Why ſhould a man whoſe blood is warm within,
Sit like his *grandſire* cut in alabaſter? *Shakeſpeare.*

So mimic ancient wits at beſt,
As apes our *grandſires* in their doublets dreſt. *Pope.*

GRAND'SON, *ſ.* The ſon of a ſon or daughter:

Almighty Jove augment your wealthy ſtore,
Give much to you, and to his *grandſons* more. *Dryden.*

GRAND'VILLE (La), a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Longwy: one league ſouth-weſt of Longwy, and one and a half north-north-eaſt of Longuion.

GRAND'VILLE, or GRANVILLE, a ſeaport town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Avranches. The harbour is only capable of receiving about ſixty ſmall veſſels. The town is ſituated on a ſharp rock, forming a peninſula of an oval form, and ſurrounded with walls: it has two gates, two fauxbourgs, and about two thouſand five hundred inhabitants; near it is an oyſter fiſhery, and on the land ſide are quarries of ſtone of a very large ſize, and remarkable hardneſs: four leagues north-weſt of Avranches, and four and a half ſouth-ſouth-weſt of Coutances. Lat. 48. 50. N. lon. 16. 3. E. Ferro.

GRANDVILLIER', a town of France, and principal place of a diſtrict, in the department of the Oiſe: fourteen miles north-north-weſt of Beauvais, and fourteen weſt of Breteuil. Lat. 49. 39. N. lon. 19. 38. E. Ferro.

GRA'NEN, a town of Spain, in the province of Aragon: thirteen miles ſouth of Hueſca.

GRANE'NA, a town of Spain, in the province of Catalonia: ten miles ſouth of Lerida.

GRANEVSKA'IA, a fortreſs of Ruſſia, on the Volga, in the government of Saratov: ninety-two miles ſouth-eaſt of Tzaritzin.

GRANGE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Bruyères: five miles ſouth-eaſt of Bruyères.

GRANGE, a town of Sweden, in the province of Dalecarlia; thirty miles ſouth of Fahlun.

GRANGE *Cape La*, or CAPE MONTE CHRISTI, on the north ſide of the iſland of St. Domingo. It is a high hill in the form of a tent, and may be ſeen by the naked eye at Cape Francois, from which it is fourteen leagues eaſt by north. A ſtrip of land joins it to the territory of Monte Chriſti; ſo that at a diſtance it ſeems to be an iſland. The cruiſers from Jamaica often lie off here. This cape lies in lat. 19. 54. 30. N. and lon. 74. 9. 30. W. from Paris; and with Point de Dunes forms the mouth of the bay of Monte Chriſti.

GRANGE (Joſeph de Chancel de la), born in 1676 of an ancient family at Antoniat in Perigord. When at the Jeſuits' ſchool at Bourdeaux, at the age of only nine years, he compoſed a comedy in three acts, which was repreſented by the ſcholars. His tragedy of Jugurtha was repreſented in the capital when he was but ſixteen, and was conſidered as an extraordinary effort for one ſo young. He continued to write pieces for the ſtage, which augmented his reputation; but the production which rendered him moſt famous, at the ſame time that it expoſed him to much ſuffering, was his *Philippiques*, a ſatire in verſe againſt Philip the regent-duke of Orleans. This appeared about 1718, and, though anonymous, was univerſally attributed to him. Its literary merit conſiſted in ſome very vigorous ſtanzas amidſt many proſaic and careleſs lines. Its matter was ſo atrociouſly libellous, charging the duke even with the crime of poiſoning ſeveral of the royal family, that the author could not be expected to remain ſecure. He

fled to Avignon, where the treachery of a French officer drew him into a ſnare which put him in the hands of his purſuers, and he was committed to the priſon of St. Marguerite. Having found means to corrupt his guard, he made his eſcape, firſt to Spain and then to Holland. Thence he was invited by Auguſtus king of Poland to his court; but upon the regent's death he returned to France, where he ever after lived unmoleſted. He continued to write, and was not ſparing of his epigrams and lampoons, as well againſt his relations and acquaintances as his enemies. He died at the family ſeat of Antoniat, in 1758. The works of La Grange, corrected by himſelf, appeared in 5 vols. 12mo. Paris, 1759. They conſiſt of tragedies, operas, and miſcellaneous poems. Of theſe, his tragedies are moſt eſteemed. The principal are, 1. Jugurtha. 2. Oreſtes and Pylades. 3. Athenais. 4. Amaſis. 5. Ino and Melicerte. In his latter years he long employed himſelf on a Hiſtory of Perigord, which he left unfiniſhed in manuſcript.

GRANGE, [*grangia*, Lat. from *granum*.] A houſe or farm where corn is laid up in barns, granaries, &c. and provided with ſtables for horſes, ſtalls for oxen, and other things neceſſary for huſbandry. This definition is agreeable to Spelman. According to Mr. Warton, grange is ſtrictly and properly the farm of a monaſtery, where the religious repoſited their corn. But in Lincolnſhire and other northern counties, they call every lone houſe, or farm, which ſtands ſolitary, a grange. See *Steevens's Shakeſpeare*.—Dr. Johnſon, in his Dictionary, derives the word from *grange*, French, and defines it, a farm, generally: a farm with a houſe, at a diſtance from neighbours.

GRANGEA'RIUS, the perſon who has the care of a *grange* for corn and huſbandry: and there was anciently a granger, or grange-keeper, belonging to religious houſes, who was to look after their granges, or farms in their own hands. *Fleta, lib. 2. c. 8.*

GRANGE-LE-BOURG, a town of France, in the department of the Upper Saône, and chief place of a canton, in the diſtrict of Lure: two leagues and a half ſouth-ſouth-eaſt of Lure.

GRANGES, a town of United America, in the ſtate of North Carolina: twenty-three miles ſouth-weſt of Exeter.

GRANGES, a town of France, in the department of the Lot and Garonne: two leagues eaſt of Tonneins.

GRANGNA'NO, a town of Italy, in the kingdom of Naples, and province of Principato Citra: fifteen miles weſt of Salerno.

GRAN'HULT, a town of Sweden, in the province of Smaland: thirty-five miles north-weſt of Calmar.

GRANGE'RIA, *ſ.* in botany, a genus of the claſs dodecandria, order monogynia. The generic characters are—Calyx five-cleft; petals five; ſtamina fifteen; drupe ſomewhat three-ſided; nut three-ſided, bony, one-ſeeded.

Grangeria Borbonica, a ſingle ſpecies. It is a tree with alternate, ovate, entire, leaves: flowers racemed. Grows at Bourbon.

GRANGE'RUS, or GRANGIA'RUS, *ſ.* An officer of a religious houſe, who was to look after their grange or farm. See GRANGEARIUS.

GRAN'ICUS, in ancient geography, a ſmall river near the Helleſpont in Leſſer Aſia, remarkable for the firſt victory gained by Alexander the Great over the armies of Darius:—for an account of which ſee the article GREECE, in this volume.

GRANIF'EROUS, *adj.* Among botaniſts, pods which bear ſeed like grains.

GRAN'ITE, *ſ.* [*granit*, Fr. from *granum*, Lat. becauſe conſiſting as it where of grains or ſmall diſtinct particles.] A compound rock, uſually conſidered as the material or nucleus of primitive mountains; conſiſting of quartz, feltſpar, and mica, and occaſionally of hornblende, ſteatites, garnet, or baſaltes. The proportion and ſize of its component parts are extremely variable, as well as their colour. The quartz, feltſpar, and mica, conſtitute the hardeſt ſort of granite, the moſt anciently known. That into which the ſhoerl enters is more ſubject to decompoſition. The granite never has any regular form, but conſiſts of enormous ſhapeleſs maſſes, of great hardneſs. In the finer ſpecimens the quartz is tranſparent; in others, generally white or grey, violet or brown. The feltſpar, white, yellow, red, green, or black, is generally the moſt copious ingredient. The mica is alſo grey, brown, yellow, green, red, violet, or black, and is commonly leaſt copious. The ſhoerl is generally black. Hence the colour of granites chiefly depends on that of the ſpar or ſhoerl. The red granites conſiſt commonly of white quartz, red feltſpar, and grey mica. The grey of white quartz, grey or violet feltſpar, and black mica. The black commonly contian ſhoerl, inſtead of feltſpar; and the green commonly contain green quartz.—For the different ſpecies, and countries where found, ſee *Granites*, under the article MINERALOGY.

GRANIV'OROUS, *adj.* [*granum*, and *voro*, Lat.] Eating grain; living upon grain.—*Granivorous* birds, as a crane, upon the firſt peck of their bills, can diſtinguiſh the qualities of hard bodies, which the ſenſe of men diſcerns not without maſtication. *Brown.*

GRAN'NA, a town of Sweden, in the province of Smaland: eighteen miles north-north-eaſt of Johnkioping.

GRAN'NAM, *ſ.* [for *grandam*.] Grandmother. Only uſed in burleſque works.—Oft my kind *grannam* told me, Tim, take warning. *Gay.*

GRANOL'LERS, a town of Spain, in the province of Catalonia: eighteen miles north-north-eaſt of Barcelona.

GRAN'SEE, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenbugh: fifteen miles eaſt-north-eaſt of New Ruppin, and thirty north-weſt of Berlin. Lat. 53. 2. N. lon. 30. 59. E. Ferro.

GRANSKE'VITZ, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania: twelve miles north-weſt of Rugen.

GRAN'SO, an iſland in the Baltic, near the eaſt coaſt of Sweden. Lat. 57. 46. N. lon. 16. 36. E. Ferro.

GRAN'SON, a town of Swiſſerland, and capital of a bailiwick, in the county of Neufchatel ſituated between the lake of Neufchatel and Mount-Jura: celebrated for a victory, which the Swiſs attained over Charles the Hardy, in 1476. The reformation was pretty generally received here in 1566: ſixteen miles ſouth-weſt of Neufchatel. Lat. 46. 50. N. lon. 24. 14. E. Ferro.

GRANT, otherwiſe called the river CAM, which ſee.

To GRANT, *v. a.* [from *garantir*, Fr. *Junius* and *Skinner*; perhaps, as *Minſhew* thinks, from *gratuito*, Lat. or rather from *gratia* or *gratificor*.] To admit that which is not yet proved; to allow; to yield; to concede.—If he be one indifferent as to the rebellion, they may take it for *granted* his complaint is the rage of a diſappointed man. *Addiſon.*

Suppoſe, which yet I *grant* not, thy deſire
A moment elder than my rival fire,
Can chance of ſeeing firſt thy title prove? *Dryden.*

To beſtow ſomething which cannot be claimed of right.—The God of Iſrael *grant* thee thy petition that thou haſt aſked of him. 1 *Sam.* xvii.—Then hath God alſo to the Gentiles *granted* repentance unto life. *Acts*, xiii. 18.

GRANT, *ſ.* The act of granting or beſtowing. The thing granted; a gift; a boon:

Courtiers juſtle for a *grant*,
And when they break their friendſhip plead their want.
Dryden.

Conceſſion; admiſſion of ſomething in diſpute.—This *grant* deſtroys all you have urg'd before. *Dryden.*

GRANT,

GRANT, in law, a conveyance in writing of incorporeal things, not lying in livery, and which cannot paſs by word only; as of reverſions, advowſons in groſs, tithes, rents, ſervices, common in groſs, &c. It has alſo been taken generally, for every gift and grant of any thing whatſoever. *Co. Lit.* 172. Grants are made by ſuch perſons as cannot give but by deed: he that granteth is termed the *grantor*, he to whom the grant is the *grantee*.

Grant is the regular method, by the common-law, of transferring the property of incorporeal hereditaments or ſuch things whereof no livery can be had. *Co. Lit.* 9. For which reaſon all corporeal hereditaments, as lands and houſes, are ſaid to lie in livery, and the others as advowſons, commons, rents, reverſions, &c. to lie in grant. And the reaſon is given by Bracton, *Traditio*, [livery] *nihil aliud eſt quàm rei corporalis, de perſonâ in perſonam, de manu in manum tranſlatio, aut in poſſeſſionem inductio: ſed res incorporales quæ ſunt ipſum jus rei vel corpori inhærens, traditionem non patiuntur.* Bract. l. 2. c. 18. Incorporeal hereditaments therefore paſs merely by delivery of the deed. And in ſeignories or reverſions of lands, ſuch grant, together with the attornment of the tenant, (while attornments were requiſite,) were held to be of equal notoriety with, and therefore equivalent to, a feoffment and livery of lands in immediate poſſeſſion. It therefore differs but little from a feoffment, except in its ſubject matter, for the operative words therein commonly uſed are *Dedi et conceſſi*; Have *given* and *granted*. 2 *Comm.* 316. c. 20.

It was formerly held, that by a grant of all a man's goods and chattels, bonds would paſs; now it is held the contrary, that the words *goods* and *chattels* do not extend to bonds, deeds, or ſpecialties, being things in action, unleſs in ſpecial caſes. *Co. Lit.* 152. The ſtat. 2 Geo. II. cap. 25, was found neceſſary to make the ſtealing ſuch bonds, &c. felony, as in caſe of other goods and chattels.

In all grants there muſt be a foundation of intereſt, or they will not be binding: If a perſon grants a rent-charge out of lands, when he hath nothing in the land, the grant will be void. *Perk.* 15. Though it is ſaid, if a man grant an annual rent out of land, wherein he hath no kind of intereſt, yet it may be good to charge the perſon of the grantor. *Owen Rep.* 3. A man may grant an annuity for him, and his heirs, to commence after his death, and it ſhall charge the heir. *Bac. Max.* 58. And after the grant of an annuity, &c. is determined, debt lies for the arrears; and the perſon of the tertenant will be charged. 7 *Rep.* 39. If a common perſon grants a rent, or other thing that lies in grant, without limitation of any eſtate, by the delivery of the deed, a freehold paſſes: but if the king make ſuch a grant of a rent, &c. it is void for uncertainty. *Danv. Rep.* 45 *a*. A grant to a man, with a blank for his chriſtian name, is void, except to an officer known by his office, when it muſt be averred: and it is the ſame where the grantee's chriſtian name is miſtaken. *Cro. Eliz.* 328.

Grants may be void by incertainty, impoſſibility, being againſt law, on a wrong title, to defraud creditors, &c. *Co. Lit.* 183. Such things as lie in grant, may not be granted or held without deed: and if any thing not grantable is granted with other things, the grant will be void for all. 2 *Shep. Abr.* 269. 273. Truſts and confidences are perſonal things, and may not be granted over to others in moſt caſes; as offices of truſt, and the like: but all kinds of chattels, real and perſonal, are grantable. *Plowd.* 141, 397.

If one grant any thing that lies in livery, or grant, and that is *in eſſe* at the time of the grant, in fee, or for life, and the eſtate is to begin at a day to come; this for the moſt part will be void: but a leaſe or grant for years, may be good *in futuro*; and may be to one for term of years, or years determinable on lives, and after to another, to begin at the end of that eſtate. 5 *Rep.* 1. *Dyer*, 58. Where a man hath a reverſion after an eſtate for life of land, and he grants a rent out of it; the grant is good, and will faſten upon the land after the eſtate of the tenant for life is ended: and if a perſon grant rents, &c. and a ſtranger take them at that time; in this caſe the grant will be good, for one may not be out of poſſeſſion of theſe things but at his pleaſure. *Perk.* 92, 98. If a man grants that to one, that he hath granted before to another, for the like term, &c. the ſecond grant will be made void. *Dyer*, 23. *Perk.* § 102. Grants are uſually made by theſe words, viz. *Have given, granted, and confirmed, &c.* And words in grants ſhall be conſtrued according to a reaſonable ſenſe, and not be ſtrained to what is unlikely. *Hob.* 304. Alſo it hath been adjudged, that grants ſhall be expounded according to the ſubſtance of the deed, not the ſtrict grammatical ſenſe; and agreeable to the intention of the parties. *Co. Lit.* 146, 313.

Where the principal thing is granted, the incident ſhall paſs; but the principal will not paſs by the grant of the incident. *Co. Lit.* 152. A lord of a manor cannot grant the ſame, and reſerve the court baron, it being inſeparably incident. *Co. Lit.* 313. A grant of a manor, without the word *cum pertinentiis*, will paſs all things belonging to the manor: the grant of a farm will alſo paſs all lands belonging to it; but a grant of a meſſuage paſſes only the houſe, out-houſes, and gardens. *Owen's Rep.* 51. When lands are granted by deed; the houſes which ſtand thereon will paſs; houſes and mills paſs by the grant of all lands, becauſe that is the moſt durable thing on which they are built. 2 *And.* 123. By grant of all the lands, the woods will paſs: and if a man grant all his trees in a certain place, this paſſeth the ſoil; though an exception of wood extends to the trees only, not the ſoil. 1 *Rol. Rep.* 33. *Dyer*, 19.

The grants of perſons under dureſs are void; that is, if they were made under an apprehenſion of ſome bodily hurt, or if the grantor were impriſoned without cauſe, and the grantee refuſed to releaſe or diſcharge him, unleſs he made ſuch grant. 2 *Inſt.* 483. But menacing to burn houſes, or ſpoil or carry away the party's goods, are not ſufficient to avoid the grant; for if he ſhould ſuffer what he is threatened, he may ſue and recover damages in proportion to the injury done him. *Perk.* 18. There are but few (if any) perſons excluded from being grantees: therefore a man attainted of felony, murder, or treaſon, may be a grantee; ſo the king's villein, an alien, one outlawed in a perſonal action, or a baſtard, may be grantees. A baſtard who is known to be the ſon of ſuch a one, may purchaſe, or be a grantee, by ſuch reputed name; for all ſurnames were originally acquired by reputation. *Co. Lit.* 3.

GRANTS OF THE KING.—The king's grants are matters of public record: for the king's excellency is ſo high in the law, that no freehold may be given to, nor derived from, him, but by matter of record. *Doct.* and *Stud. b.* 1. *d.* 8.—To this end a variety of offices are erected, communicating in a regular ſubordination one with another, through which all the king's grants muſt paſs, and be tranſcribed and enrolled; that the ſame may be narrowly inſpected by his officers, who will inform him if any thing contained therein is improper, or unlawful to be granted. Theſe grants, whether of lands, honors, liberties, franchiſes, or aught beſides, are contained in charters or letters patent; that is open letters, *literæ patentes*, ſo called becauſe they are not ſealed up, but expoſed to open view, with the great ſeal pendant at the bottom: and are uſually directed or addreſſed by the king to all his ſubjects at large. Theſe grants or letters-patent muſt firſt paſs by bill; which is prepared by the attorney and ſolicitor-general, in conſequence of a warrant from the crown: and is there ſigned, that is ſubſcribed at top, with the king's own ſign-manual, and ſealed with his privy ſignet, which is always in the cuſtody of the principal ſecretary of ſtate: and then ſometimes it immediately paſſes under the

great ſeal, in which caſe the patent is ſubſcribed in theſe words, *Per ipſum regem*, By the king himſelf.—Otherwiſe the courſe is to carry an extract of the bill to the keeper of the privy ſeal, who makes out a writ or warrant thereupon to the chancery, ſo that the ſign manual is the warrant to the privy ſeal, and the privy ſeal is the warrant to the great ſeal: and in this laſt caſe the patent is ſubſcribed, *Per breve de privato ſigillo*; By writ of privy ſeal. But there are ſome grants which only paſs through certain offices, as the Admiralty or Treaſury, in conſequence of a ſign-manual, without the confirmation of either the ſignet, the great, or the privy, ſeal. 2 *Blackſt. Comm. c.* 21.

The manner of granting by the king does not more differ from that by a ſubject, than the conſtruction of his grants when made. A grant made by the king at the ſuit of the grantee, ſhall be taken moſt beneficially for the king, and againſt the party; whereas the grant of a ſubject is conſtrued moſt ſtrongly againſt the grantor. Wherefore it is uſual to inſert in the king's grants, that they are made, not at the ſuit of the grantee, but *ex ſpeciali gratiâ, certâ ſcientiâ, et mero motu, regis*; of the king's ſpecial favour, certain knowledge, and mere motion; and then they have a more liberal conſtruction. *Finch L.* 100.

A ſubject's grant ſhall be conſtrued to include many things beſides what are expreſſed, if neceſſary for the operation of the grant. Therefore, in a private grant of the profits of land for one year, free ingreſs, egreſs, and regreſs, to cut and carry away thoſe profits, are alſo incluſively granted; and if a feoffment of land was made by a lord to his villein, this operated as manumiſſion, for he was otherwiſe unable to hold it. *Co. Lit.* 56. But the king's grant ſhall not enure to any other intent, than that which is preciſely expreſſed in the grant. As if he grants land to an alien, it operates nothing; for ſuch grant ſhall not alſo enure to make him a denizen, that ſo he may be capable of taking by grant. *Finch L.* 110.

When it appears from the face of the grant that the king is miſtaken, or deceived, either in matter of fact or of law, as in caſe of falſe ſuggeſtion, miſinformation, or miſrecital of former grants; or if his own title to the thing granted be different from what he ſuppoſes; or if the grant be informal; or if he grants an eſtate contrary to the rules of law; in any of thoſe caſes the grant is abſolutely void. *Freem.* 172. For inſtance, if the king grants lands to one and his heirs-male, this is merely void: for it ſhall not be an eſtate-tail, becauſe there want words of procreation, to aſcertain the body out of which the heirs ſhall iſſue: neither is it a fee-ſimple as in common grants it would be, becauſe it may reaſonably be ſuppoſed that the king meant to give no more than eſtate-tail: the grantee is therefore, if any thing, nothing more than tenant at will. *Finch*, 101 2. 5 *Rep.* 94.

To prevent deceits of the king with regard to the value of eſtates granted, it is particularly provided by ſtat. 1 H. IV. c. 6, that no grant of his ſhall be good, unleſs in the grantee's petition for them, expreſs mention be made of the real value of the lands. Other ſtatutes have alſo been paſſed relative to this ſubject. The king's grantee ſhall not forfeit for non-payment of rent, where the rent has been anſwered before proceſs iſſued. *Stat.* 21 *Jac.* 1. *c.* 25. The crown reſtrained from granting lands, except for thirty-one years, &c. forfeited eſtates excepted. *Stat.* 1 *Ann. c.* 7. Before the ſtatute *de Prerogativa Regis*, dowers, advowſons, and other things, have paſſed by the general grant of the king; but by that ſtatute they are to be granted in expreſs words. 1 *Rep.* 50. The king's grant is good for himſelf and ſucceſſors, though his ſucceſſors are not named. *Yelv.* 13.

The king may not grant away an eſtate tail in the crown, &c. And the law takes care to preſerve the inheritance of the king for the benefit of the ſucceſſor. 2 *And.* 154. A grant may not be made by the king which tends to a monopoly, againſt the intereſt and liberty of the ſubject. Nor can the king make a grant *non obſtante* any ſtatute made, or to be made; if he doth, any ſubſequent ſtatute, prohibiting what is granted, will be a revocation of the grant. *Dyer*, 52. Where the king is reſtrained by the common law to make a grant, if he makes a grant *non obſtante* the common law, it will not make the grant good: but when he may lawfully make a grant, and the law requires he ſhould be fully appriſed of what he grants, and not be deceived, a *non obſtante* ſupplies it, and makes the grant good. If the words are not ſufficient to paſs the thing granted, a *non obſtante* will not help. *Nelſ. Abr.* 904. If a grant is made by the king, and a former grant is in being of the ſame thing, if it be not recited, the grant will be void: and reciting a void grant, when there is another good, may make the king's grant void. *Cro. Car.* 143. And there may be a *non obſtante* to a former grant. 5 *Rep.* 94.

The king's grants may be void, by reaſon of incertainty; as if debts and duties are granted, without ſaying in particular what duties, &c. 12 *Rep.* 46. But where there is a particular certainty preceding, they ſhall not be deſtroyed by any incertainty or miſtake which follows: and there is a diſtinction where a miſtake of title is prejudicial to the king, and when it is in ſome deſcription of the thing which is ſupplemental only, and not material or iſſuable. 1 *Mod.* 195. The king grants the manor of D. which he has by the attainder of a certain perſon, &c. and in fact the king hath it not ſo; this grant is void. 10 *Rep.* 109.

If the king grants a meſſuage of the value of five pounds a year to A. B. and it be of the yearly value of ten pounds, the value being in the ſame ſentence with the grant, will make it void: though if it be mentioned in another ſentence it may be good. *Jenk. Cent.* 261. The grant of the king to a corporation, that they ſhall not be impleaded for lands, nor for any cauſe ariſing there, elſewhere than before themſelves, doth not bind the king where he is party: and the king by his grant cannot exclude himſelf from proſecuting pleas of the crown; for it concerns the public government. *Keilw.* 88. *Dyer*, 376.

The king cannot grant a thing intruſted to him in reſpect of his ſovereignty: as, the laſe of a church, before or after it becomes void. 2 *Rol.* 187. Nor purveyance, butlerage, priſage, &c. Nor the power to make a diſpenſation of a ſtatute. 7 *Co.* 36 *b.* So he cannot grant the lands, or goods, of a recuſant-convict, before the commiſſion returned. Nor the lands or goods of one attainted of treaſon, before his attainder. *Dyer*, 108. *a.* So the king cannot grant the proſecution or execution of any penal ſtatute to another; for it is intruſted with him as the head of the public-weal. *Co.* 37. *a.* Nor the penalty or benefit of a penal ſtatute, before it be recovered. 7 *Co.* 36. *b.* Nor any fine or forfeiture of a particular perſon, before he be convicted.—Declared by ſtat. 1 Will. and Mary, ſtat. 2. c. 2, that ſuch grant or promiſe is illegal and void.

GRANT (Francis), an eminent lawyer and judge in Scotland, deſcended from the family of the Grants of Grant in that kingdom, and born about the year 1660. The abilities he ſhowed in favour of the revolution, recommended him to an extenſive practice; in which he acquired ſo much honour, that when the union between the two kingdoms was in agitation, queen Anne created him a baronet, with a view of ſecuring his intereſt in that meaſure; and upon the ſame principle, ſhe ſoon after created him a judge, or one of the lords of ſeſſion. From this time, according to the cuſtom of Scotland, he was ſtyled, from the name of his eſtate, Lord Cullen; and the ſame good qualities that recommended him to this honourable office, were very conſpicuous in the diſcharge of it; which he continued for twenty years with the higheſt reputation. He died on March 16, 1726.

1726. His eſſays on law, religion, and education, were dedicated to George II. when prince of Wales; and his royal highneſs's ſecretary, Mr. Samuel Molineaux, wrote him a letter of thanks, in which were many gracious expreſſions, as well in relation to the piece as to its author.

GRANT'ABLE, *adj.* That which may be granted.—The office of the biſhop's chancellor was *grantable* for life. *Ayliffe.*

GRANTEE', *ſ.* He to whom any grant is made.—To ſmooth the way to popery in Mary's time, the *grantees* were confirmed by the pope in the poſſeſſion of the abbey-lands. *Swift.*

GRANTOR', *ſ.* He by whom a grant is made.—A *duplex querela* ſhall not be granted under pain of ſuſpenſion of the *grantor* from the execution of his office. *Ayliffe.*

GRANT'HAM, a rich and populous town in Lincolnſhire, ſeated on the river Witham, about thirty miles to the ſouth of Lincoln, in the road from London to York, (which was formerly the Ermine-ſtreet of the Romans,) twenty-one miles north-by-weſt of Stamford, fourteen ſouth of Newark, and one hundred and ten north-by-weſt of London. The church is a lofty ſtructure, with one of the higheſt ſtone ſpires in England, being one hundred yards high. This beautiful ſpire was materially injured by a ſtorm on the 30th of July, 1797. The inſide of the church is very handſome, and contains a fine-toned organ with a double front, and ten good muſical bells. Here are two charity-ſchools: one founded by biſhop Fox, who was born in a poor mean houſe at Ropeſley, about five miles diſtant from this place, now nearly deſtroyed by time; and here ſir Iſaac Newton received the firſt principles of literature, under the famous William Walker, then ſchoolmaſter. Grantham has a large market on Saturdays for corn, and abundance of all kinds of proviſions at a reaſonable rate. Alſo five fairs, as follow:—the fifth Monday in Lent; Holy Thurſday; July the 10th; October the 26th; and December the 17th: all for horſes, ſheep, and other cattle. The town is governed by an ancient corporation, conſiſting of an alderman, a recorder, twelve burgeſſes, a coroner, an eſcheator, twelve ſecond men, who are the common-council, and ſix conſtables, to attend on the court: the alderman and burgeſſes have power to act as juſtices of the peace in the Soke of Grantham, comprehending twelve neighbouring towns. It ſends two members to parliament, who are choſen by the freemen of the corporation. In 1793, an act of parliament was obtained to make a navigable canal from Grantham to the Trent at Nottingham, which opens a communication, by water-carriage, to moſt parts of the kingdom; and is highly beneficial to this town and neighbourhood.

GRANT'STON, a ſmall lake of United America, in the ſtate of North Carolina: twenty-five miles weſt of Exeter.

GRANTZ'WASSER, a river of Germany, in the circle of Upper Saxony, which runs into the Elſter, two miles ſouth-weſt of Muckenburg, in the marggraviate of Meiſſen.

GRAN'VILLE, [*grande ville*, Fr.] A great town; a ſurname.

GRAN'VILLE (George), baron Lanſdown, a nobleman diſtinguiſhed as a poet, born in 1667. He was entered as early as his twelfth year at Trinity college, Cambridge; and in 1679, diſplayed his juvenile propenſity to poetry by a copy of verſes addreſſed to the ducheſs of York on her viſit to the univerſity. On the acceſſion of James II. in 1685, his courtly muſe reſumed her ſtrains to celebrate the new monarch, in three ſhort pieces. When, in 1688, the invaſion of the prince of Orange was threatened, he wrote a ſpirited, though reſpectful, letter to his father, requeſting to be preſented to his majeſty as one who was ambitious to devote his life to his ſervice. After the revolution, being poſſeſſed neither of intereſt nor conſiderable fortune, he lived in retirement. During this period his dramatic works were chiefly compoſed and acted. The firſt of theſe was, The She Gallants, ſaid to have been written at an age when ſome perſons are but beginning to ſpell. He afterwards gave it in a more correct form, under the title of, Once a Lover and always a Lover; and it appears, according to the faſhion of thoſe times, to have been more diſtinguiſhed for licentiouſneſs than wit. His tragedy of Heroic Love, founded on the fable of Homer's Iliad, was acted in 1696, with great applauſe from the wits and critics. Dryden addreſſed a copy of complimentary verſes to him on the occaſion, in which the old bard adopts the young one as his ſucceſſor in fame:

But ſince 'tis nature's law, in love and wit,
That youth ſhould reign, and with'ring age ſubmit,
With leſs regret thoſe laurels I reſign,
Which, dying on my brows, revive on thine.

Dryden, however, though a poet, was no prophet; and it was beyond even his powers to raiſe mediocrity to the rank of excellence. His Maſque of Peleus and Thetis, joined to an alteration of Shakeſpeare's Merchant of Venice, and his Britiſh Enchanters, a dramatic Poem, complete the liſt of his performances in this claſs. They are ſaid to have been well received on the ſtage, but have retained no place there.

When queen Anne came to the crown, Mr. Granville was elected a member for the borough of Fowey in the firſt parliament of the new reign; and ſoon after, partaking of the ardour againſt the ambition of Louis XIV. he joined in a tranſlation of the Philippics of Demoſthenes, intended to rouſe the nation to arms under the victorious and invincible duke of Marlborough. On the change of the miniſtry in 1710, he was appointed ſecretary at war, in the room of Robert Walpole, afterwards earl of Orford. He married in that year Mary, daughter of Edward Villiers earl of Jerſey, then the widow of Thomas Thynne, eſq. He was introduced into the houſe of peers by the title of lord Landſdown, baron of Biddeford, at the memorable creation of twelve peers in one day, December 31, 1711: and his elevation was not one of thoſe which appeared extraordinary, as two peerages had become extinct in the Granville family. On account of his principles and conduct he ſtood high in the favour of the queen, who conferred upon him firſt the poſt of comptroller of the houſehold, with a ſeat in the privy-council, and then of treaſurer of the houſehold. The acceſſion of George I. put an end to the power of his party, and deprived him of his place. He remained ſteady to his former connections, and proteſted againſt the bill for attainting the duke of Ormond and lord Bolingbroke. He was, in conſequence, reckoned among thoſe who were diſaffected to the new order of things; and, upon the breaking out of the rebellion in 1715, was committed to the Tower. He was kept in impriſonment till February, 1717, when he obtained his liberty, and reſumed his ſeat in the houſe of lords. The ſtedfaſtneſs of his political principles was diſplayed in 1719, by an animated ſpeech againſt the propoſed repeal of the bill to prevent occaſional conformity, which he printed. It is ſuppoſed that a derangement in his affairs, owing to want of economy, was the cauſe of his ſpending ſome years afterwards upon the continent. During his abſence, the firſt volume of biſhop Burnet's Hiſtory of his own Times making its appearance, lord Landſdown was induced to undertake the vindication of the characters of Monk duke of Albemarle and the earl of Bath from ſome aſperſions thrown upon them in that work. On his return home, in 1732, he publiſhed a ſplendid edition of his works. He was now ſo well reconciled to the change in the ſucceſſion, that he went to court, where he was graciouſly received by queen Caroline, to whom he preſented his works, with ſome elegant lines written on the

laſt leaf. He died, a few days after his lady, on January 30, 1735, in his ſixty-eighth year. He had no male iſſue, but left four daughters. He is chiefly known as a writer of ſongs and ſhort amatory pieces, moſt of which are addreſſed to "Myra," who was the counteſs of Newburgh, his youthful flame. They are not, however, either highly poetical or ſtrongly expreſſive of feeling. Of his other pieces, Dr. Johnſon characteriſes his Eſſay on unnatural Flights in Poetry as poſſeſſing didactic merit; and his Britiſh Enchanters as lively and pleaſing, though he acknowledges that it confounds the manners of different ages. He ſpeaks favourably alſo of his Prologues and Epilogues, but they appear to riſe little above the uſual ſtyle of thoſe compoſitions.

GRAN'VILLE, a town of France, in the department of the Upper Saône, and chief place of a canton, in the diſtrict of Veſoul: three leagues and a quarter ſouth-weſt of Veſoul, and five eaſt-north-eaſt of Gray.

GRAN'VILLE, a county of the American States, in Hillſborough diſtrict, North Carolina, has the ſtate of Virginia north, and contains 10,982 inhabitants. Chief town Williamſburg.

GRAN'VILLE, a townſhip of the American States, in Annapolis county, Nova-Scotia. It lies on the north ſide of Annapolis river, on the Bay of Fundy, and is thirty miles in length; firſt ſettled from New-England.

GRAN'VILLE, a townſhip of the American States, in Hampſhire county, Maſſachuſetts, fourteen miles weſt of Springfield. It was incorporated in 1754, and contains 1979 inhabitants.

GRAN'VILLE, a townſhip of the American States, in Waſhington county, New-York, containing 2240 inhabitants, of whom 422 are electors.

GRANVILLE's RIVER, a river of the iſland of Egmont, of New Guernſey, which runs into the ſea. Lat. 10. 42. S. lon. 163. 58. E. Greenwich.

GRANULA'RIA, *ſ.* in botany, a genus of the claſs cryptogamia, order fungi. Generic characters—Fungus roundiſh, filled with granulations immerſed in a mucilage. There is but one ſpecies, called Granularia piſiformis.

GRAN'ULARY, *adj.* Small and compact; reſembling a ſmall grain or ſeed.—Small-coal, with ſulphur and nitre, proportionably mixed, tempered, and formed into *granulary* bodies, do make up that powder which is uſed for guns. *Brown.*

To GRAN'ULATE, *v. n.* [*granuler*, Fr. from *granum*, Lat.] To be formed into ſmall grains.—The juice of grapes, inſpiſſated by heat, *granulates* into ſugar. *Spratt.*

To GRAN'ULATE, *v. a.* To break into ſmall maſſes or granules. To raiſe into ſmall aſperities.—I have obſerved, in many birds, the gullet, before its entrance into the gizard, to be much dilated, and thick ſet, or as it were *granulated* with a multitude of glandules, each whereof was provided with its excretory veſſel. *Ray.*

GRANULA'TION, *ſ.* [*granulation*, Fr. from *granulate.*] The act of pouring or agitating melted metal, ſo that it may granulate or congeal into ſmall grains.—Gunpowder and ſome ſalts are ſaid to be granulated, from their reſemblance to grain or ſeed. *Quincy.*—The act of ſhooting or breaking in ſmall maſſes.—Tents in wounds, by reſiſting the growth of the little *granulations* of the fleſh, in proceſs of time harden them, and in that manner produce a fiſtula. *Sharp.*

The art of dividing metallic ſubſtances into grains or ſmall particles, is of great importance in commerce; and has of late undergone conſiderable improvement. Since the entire metals cannot be pulveriſed, becauſe not ſufficiently brittle, and ſince the mechanical ſubdiviſion of their parts is attended with much labour and difficulty, recourſe is generally had to fuſion; and the ſubdiviſion is made at the inſtant of congelation. This is done either by pouring the melted metal into water, or by agitating it in a box until the moment of congelation, at which inſtant the whole becomes converted into a powder. Theſe different proceſſes are preferable the one to the other, according to the nature of the metallic ſubſtance. Thus gold, ſilver, copper, or iron, cannot be granulated by agitation, not only becauſe the great heat required for their fuſion would be productive of inconvenience, but likewiſe becauſe they poſſeſs a great degree of tenacity when heated almoſt to melting. Lead, tin, and braſs, on the contrary, are very brittle when heated, and therefore beſt granulated in this way. Various contrivances are uſed to prevent danger and inſure ſucceſs in the ſeveral manufactories that require granulation. Copper is granulated for making braſs, by pouring it through a perforated ladle into a covered veſſel of water with a moveable falſe bottom. A compound metal, conſiſting chiefly of lead, is poured into water through a perforated veſſel of another kind, for making ſmall ſhot, in which the height above the ſurface of the fluid is ſaid to require particular adjuſtment; but in the new manufactory of patent ſhot the height is very great, being upwards of one hundred feet.

GRAN'ULE, *ſ.* [from *granum*, Lat.] A ſmall compact particle.—With an excellent microſcope, where the naked eye did ſee but a green powder, the aſſiſted eye could diſcern particular *granules*, ſome blue, and ſome yellow. *Boyle.*

GRAN'ULOUS, *adj.* Full of little grains.

GRAN'ZA, a town of Africa, in the kingdom of Mogadoxa.

GRAN'ZOW, a town of Germany, in the circle of Upper Saxony, and Ucker Mark of Brandenburgh: eight miles ſouth-eaſt of Prenzlow.

GRAPE, *ſ.* [*grappe*, Fr. *krappe*, Dutch.] The fruit of the vine, growing in cluſters; the fruit from which wine is expreſſed. For the natural hiſtory and culture of the plant, and the ſpecies from which the different kinds of wine are manufactured, ſee the article VITIS.—Thou ſhalt not glean thy vineyard, neither ſhalt thou gather every *grape* of thy vineyard; thou ſhalt leave them for the poor and ſtranger. *Lev.* xix. 10.

Here are the vines in early flow'r deſcry'd,
Here *grapes* diſcolour'd on the ſunny ſide. *Pope.*

GRAPE (HYACINTH), *ſ.* in botany. See HYACINTHUS. GRAPE (SEA), ſee EPHEDRA. GRAPE (SEA-SIDE), ſee COCCOLOBA.

GRAPE-SHOT, *ſ.* In artillery, a combination of ſmall ſhot, put into a thick canvas bag, and corded ſtrongly together, ſo as to form a kind of cylinder, whoſe diameter is equal to that of the ball adapted to the cannon.

GRA'PE-STONE, *ſ.* The ſtone or ſeed contained in the grape:

When obedient nature knows his will,
A fly, a *grape-ſtone*, or a hair, can kill. *Prior.*

GRA'PHIC, or GRAPHICAL, *adj.* [γραφικος, of γραφω, Gr. to deſcribe.] Well delineated.—Write with a needle, or bodkin, or knife, when the fruit or trees are young; for as they grow, ſo the letters will grow more large and *graphical*. *Bacon.*

He can
Find all our atoms from a point t' a ſpan:
Our cloſeſt creeks and corners; and can trace
Each line, as it were *graphic*, in the face. *B. Jonſon.*

GRA'PHICALLY, *adv.* In pictureſque manner; with good deſcription or delineation.—The hyena odorata, or civet cat, is *graphically* deſcribed by Caſtellus. *Brown.*

GRAPH'ICE, *ſ.* [from *graphic.*] The act of drawing, the act of painting to the life. *Not much uſed. Scott.*

GRAPHIS'CUS, [γραφισκος, Gr. from γραφος, a ſtyle or dart.] A ſurgical inſtrument to extract darts.

GRA'PHITES. See MINERALOGY.

GRA'PHIUM, *ſ.* [from γραφω, Gr. to write.] The ſtyle or iron pen with which the ancients wrote on plates covered with wax.

GRAPHOI'DES,

GRAPHOI'DES, *ſ.* In anatomy, the proceſs of the ſcull bone, near the baſis of the brain, ſhaped like the ſtyle of the ancients.

GRAPHOM'ETER, *ſ.* [from γραφω, to write, and μετρεω, to meaſure.] A mathematical inſtrument, uſed in taking heights and diſtances.

GRAP'NEL, *ſ.* [*grapin*, Fr.] A ſmall anchor belonging to a little veſſel. A grappling-iron with which in fight one ſhip faſtens to another.

To GRAP'PLE, *v. n.* [*grabbelen*, Dutch; *krappeln*, German.] To contend by ſeizing each other, as wreſtlers. Does he think that he can *grapple* with divine vengeance, and endure the everlaſting burnings? *South.*

Living virtue, all atchievements paſt,
Meets envy, ſtill to *grapple* with at laſt. *Waller.*

To conteſt in cloſe fight:

Sometimes, from fighting ſquadrons of each fleet,
Two *grappling* Ætnas on the ocean meet,
And Engliſh fires with Belgian flames contend. *Dryden.*

To GRAP'PLE, *v. a.* To faſten; to fix; to join indiſſolubly. *Obſolete:*

Grapple your minds to ſternage of the navy,
And leave your England as dead midnight ſtill. *Shakeſ.*

To ſeize; to lay faſt hold of.—For hippagines, veſſels for the tranſporting of horſe, we are indebted to the Salaminians; for *grappling* hooks, to Anacharſis. *Heylyn.*

GRAP'PLE, *ſ.* Conteſt hand to hand, in which the combatants ſeize each other; the wreſtlers' hold:

As when Earth's ſon, Antæus, ſtrove
With Jove's Alcides, and, oft foil'd, ſtill roſe
Freſh from his fall, and fiercer *grapple* join'd,
Throttled at length in th' air, expir'd and fell. *Milton.*

Cloſe fight.—In the *grapple* I boarded them; on the inſtant they got clear of our ſhip; ſo I alone became their priſoner. *Shakeſpeare.*—Iron inſtrument by which one ſhip faſtens to another:

But Cymon ſoon his crooked *grapples* caſt,
Which with tenacious hold his foes embrac'd. *Dryden.*

GRAP'PLEMENT, *ſ.* Cloſe fight; hoſtile embrace. *Not in uſe:*

They catching hold of him, as down he lent,
Him backward overthrew, and down him ſtay'd
With their rude hands and grieſly *grapplement*. *Spenſer.*

GRA'RAH, a town of Africa, in the country of Beni Mezzab: ſixty miles north-weſt of Guergela.

GRAS'HOLM, one of the ſmaller Orkney iſlands: half a mile ſouth of Shapinſha.

GRAS'HOPPER, *ſ.* A ſmall inſect that hops in the ſummer graſs; the locuſt: for the natural hiſtory and figures of which, ſee the article GRYLLUS. The *cicada* is often by the poets tranſlated *graſhopper*, but improperly:

Where ſilver lakes, with verdant ſhadows crown'd,
Diſperſe a grateful chilneſs all around;
The *graſhopper* avoids th' untainted air,
Nor in the midſt of ſummer ventures there. *Addiſon.*

GRA'SIER. See GRAZIER.

GRA'SKA, a town of Poland, in the palatinate of Braclaw: fifty miles ſouth-weſt of Braclaw.

GRAS'MARK, a town of Sweden, in the province of Warmeland: forty-two miles north of Carlſtadt.

GRAS'MERE, a fine lake and beautiful village in Weſtmoreland, to the weſt of Ambleſide. Its margin is hollowed into ſmall bays, with bold eminences; ſome of rock, ſome of turf, that half conceal and vary the figure of the water. From the ſhore, a low promontory projects far into the lake; and on it ſtands the village, with the pariſh church riſing in the midſt of it.

GRA'SON, an iſland in the gulph of Bothnia, near the coaſt of Sweden: fifteen miles long, and two wide. Lat. 60. 22. N. lon. 18 20. E. Greenwich.

To GRASP, *v. a.* [*graſpare*, Ital.] To hold in the hand; to gripe.—O fool that I am, that thought I could *graſp* water and bind the wind. *Sidney.*

Kings, by *graſping* more than they can hold,
Firſt made their ſubjects, by oppreſſion, bold. *Denham.*

To ſeize; to catch at:

For what are men who *graſp* at praiſe ſublime,
But bubbles on the rapid ſtream of time? *Young.*

To GRASP, *v. n.* To catch: to endeavour to ſeize; to try at.—So endleſs and exorbitant are the deſires of men, that they will *graſp* at all, and can form no ſcheme of perfect happineſs with leſs. *Swift.*—To ſtruggle; to ſtrive; to grapple. *Not now in uſe:*

See, his face is black, and full of blood;
His hands abroad diſplay'd, as one that *graſpt*
And tugg'd for life. *Shakeſpeare.*

To gripe; to encroach:

Like a miſer 'midſt his ſtore,
Who *graſps* and *graſps* 'till he can hold no more. *Dryden.*

GRASP, *ſ.* The gripe or ſeizure of the hand:

This hand and ſword have been acquainted well;
It would have come before into my *graſp*,
To kill the raviſher. *Dryden.*

Poſſeſſion; hold;

I would not be the villain that thou think'ſt
For the whole ſpace that's in the tyrant's *graſp*. *Shakeſ.*

Power of ſeizing.—They looked upon it as their own, and had it even within their *graſp*. *Clarendon.*

GRAS'PER, *ſ.* One that graſps, ſeizes, or catches at.

GRASP'ING, *ſ.* A graſp, the act of ſeizing with the hand.

GRASS, *ſ.* [ȝnæꝛ, Sax.] The common herbage of the field on which cattle feed.—Ye are grown fat as the heifer at *graſs*, and bellow as bulls. *Jer.* l. 11.

The graſſes, ſo extenſively uſeful in rural economy, are chiefly to be found in the ſecond order of the third claſs, *triandria digynia*, in the Linnæan ſyſtem. However numerous they may be, and diſtinct from each other, they generally agree in the following circumſtances; which, taken together, form the natural character of this tribe or family. The *calyx* is a glume or chaff, in moſt ſpecies compoſed of two valves, one larger and gibbous, the other ſmaller and flat. The *corolla* alſo is a bivalve glume, and is accompanied by a very ſmall, ſuperior, two-leaved, nectarium, of an oblong form. The *ſtamens* are three in number; the filaments capillary; the antheræ oblong and bicapſular. There are two *piſtilla*, which are pubeſcent, reflex, or bent back from each other, and terminated by pubeſcent ſtigmas. One *ſeed* only, or grain, ſucceeds to each flower; it has no pericarp, but is covered by the calyx, corolla, or both; it is of an oblong form, drawn to a point at both ends, and monocotyledonous, or compoſed of one lobe only.

Beſides this agreement in the fructification, graſſes are known at firſt ſight to perſons totally unſkilled in botany, by their peculiar appearance, or habit, as botaniſts call it. Their ſtalk is ſimple or unbranched, ſtraight, hollow, and jointed; their leaves are quite entire, of a long linear ſhape, acuminate or drawing gradually to a point at the end, marked with lines parallel to the midrib or middle nerve. See this exemplified in the article BOTANY, vol. iii. Plate XI. fig. 11, 12, 13. p. 265. Upon the culm or ſtalk, there is only one of theſe leaves to each joint, ariſing from a ſheath which inveſts the ſtalk uſually to a conſiderable diſtance. The ſeed, it is well known, is farinaceous or abounding in meal, and is the principal food of many tribes of birds; as the

the ſeeds of the larger ſorts, which we call corn, are of mankind. One genus of graſs, entitled *anthoxanthum*, differs from the reſt in having two ſtamens only. And there are ſeveral genera, which, having male flowers mixed with the hermaphrodites, are placed by Linnæus in his claſs *polygamia*.

Artificial graſſes, viz. clover, lucern, ſaintfoin, trefoil, &c. are moſtly leguminous plants, totally different in every reſpect from graſſes, except in being uſed as food for cattle; and are to be ſought for in the claſs *diadelphia*. All the graſſes are particularly treated of under their reſpective genera, as enumerated under the article BOTANY, vol. iii. p. 294.

It is wonderful (remarks the ingenious and benevolent Stillingfleet,) how long mankind has neglected to make a proper advantage of plants ſo important as graſſes, which in almoſt every region and country of the earth are the ſupport and ſuſtentation of cattle. The farmer and grazier, as well as moſt country gentlemen, for want of diſtinguiſhing and ſelecting the beſt graſſes for ſeed, ſuffer their paſtures to be over-run with weeds, or rendered unproductive by a ſpecies of graſs unfavourable and ill-adapted to the ſoil; whereas, by making a proper choice of ſeeds, with due care and good huſbandry, they might be ſure of the beſt crops of graſs, and in the greateſt abundance that the nature of their land will admit of. The number of the beſt graſſes are indeed comparatively ſmall; yet are there ſufficient of them to ſtock advantageouſly every kind of ſoil, and to render even the poorer ſandy lands productive.

Mr. Stillingfleet, in his Obſervations on Graſſes, has ſelected eleven ſpecies, which he recommends above all others for cultivation; viz. 1. *Vernal graſs*, common on dry hills, on ſound rich meadow land, and alſo in woods. It is very early, and a good graſs for ſheep paſtures. It is very eaſy to propagate, ſince it ſheds its ſeeds upon the leaſt rubbing. See ANTHOXANTHUM odoratum.

2. *Meadow fox-tail graſs*, found in great plenty in the beſt meadows about London, and makes very good hay. Linnæus recommends it to be ſown on grounds that have been drained. It may be gathered at any time of the year from hay-ricks, for it does not ſhed its ſeeds without rubbing. See ALOPECURUS pratenſis.

3. *Fine bent graſs*, found in great plenty on the beſt ſheep paſtures. See AGROSTIS capillaris.

4. *Mountain hair graſs*, abundant alſo in ſimilar ſituations. See AIRA montana.

5. *Silver hair graſs*, found in the ſame kinds of paſtures. See AIRA caryophyllea.

6. *Great meadow graſs*, which, together with the narrow-leaved ſort, is common in the beſt meadows, and makes both good paſture and hay. See POA pratenſis, anguſtifolia, and compreſſa.

7. *Annual meadow graſs*, which makes the fineſt turf. It grows every where by way-ſides, and on rich ſound commons. In ſome parts it is called *Suffolk graſs*. See POA annua.

8. *Sheep's feſcue graſs*, ſo much eſteemed as the ſweeteſt feed for ſheep, and common on ſheep downs. See FESTUCA ovina.

9. *Purple feſcue graſs*, found on ſheep downs, with fine bent and ſilver hair-graſs. See FESTUCA rubra.

10. *Flote feſcue graſs*, a very fattening graſs when growing in water. See FESTUCA fluitans.

11. *Creſted dog's-tail graſs*, proper for deer in parks, and for ſheep; and making a fine turf upon dry ſandy or chalky ſoils. See CYNOSURUS criſtatus.

Beſides theſe, Mr. Stillingfleet mentions as ſecondary kinds, the following:

12. *Yellow oat graſs*, eaſily propagated for ſheep, and not uncommon in good meadows. See AVENA flaveſcens.

13. *Perennial darnel*, or *ray graſs*, well known and generally cultivated all over England. See LOLIUM perenne.

The above graſſes come into ear between the beginning of May and the middle of June, in the following order: viz. 1. Annual meadow. 2. Meadow fox-tail. 3. Vernal. 4. Great meadow. 5. Narrow-leaved meadow. 6. Creſted dog-tail. 7. Sheep's feſcue. 8. Purple feſcue. 9. Fine bent. 10. Marſh bent. 11. Silver hair. 12. Yellow oat. 13. Flote feſcue.

The late ingenious Mr. Curtis, who beſtowed much attention, and tried many experiments, on this ſubject, remarks, that although it is an opinion which has long prevailed among many of the more enlightened agriculturiſts of the preſent age, that much of our meadow and paſture land may be rendered far more valuable than it is at preſent, by the introduction of ſome of our beſt graſſes; that although Stillingfleet and others have endeavoured to excite the huſbandman to collect and cultivate graſs-ſeeds, by writings fraught with the ſoundeſt reaſoning; and the Society for the Encouragement of Arts, Manufactures, and Commerce, have attempted to attract him by the offers of well-directed premiums; yet hitherto they have not been productive of the deſired effect: ray-graſs, with very few exceptions, continuing ſtill to be the only graſs whoſe ſeeds can be purchaſed for laying down land. But, this graſs not being adapted to every ſoil and ſituation, Mr. Curtis has judiciouſly ſelected ſix of the beſt ſorts of graſſes, adapted to ground of different quality. 1. Anthoxanthum vernum, or ſweet-ſcented vernal graſs, which is the earlieſt of all our graſſes next to Cynoſurus cœruleus: it will grow in any ſoil or ſituation; cattle are fond of it: but it is not ſo productive in point of crop as ſome others, and it yields the feweſt ſeeds.

2. Alopecurus pratenſis, or meadow fox-tail graſs, is almoſt as early as the foregoing, much larger, and of quicker growth; conſequently much more productive.

3. Poa pratenſis, or ſmooth-ſtalked meadow graſs. The foliage ſhoots early, but the flowering-ſtems are not produced ſo ſoon as the foregoing. Where early graſs paſturage is deſired, it cannot better be obtained than by a combination of theſe three; if crop be an object, this will have the preference. Smooth-ſtalked meadow graſs rather affects a dry ſituation, and hence keeps its verdure in long-continued dry weather better than moſt others; it will grow on the top of a wall, but more luxuriantly in a rich meadow: it has a root which creeps like couch graſs, and is almoſt as difficult to extirpate; it ought therefore to be introduced with caution where the paſturage is not intended to be permanent.

4. Poa trivialis, or rough-ſtalked meadow-graſs, loves moiſture and a ſheltered ſituation; hence, though few graſſes are more productive or more adaped to hay or paſturage, it is tender, and liable to be injured by ſevere cold or exceſſive drought.

5. Feſtuca pratenſis, or meadow feſcue graſs, comes neareſt to ray graſs, to which however it is much ſuperior. It is ſtrictly perennial, very hardy, and will thrive not only in very wet, but alſo in dry, ground; it produces more ſeeds than any of the others, which are eaſily gathered, and readily grow.

6. Cynoſurus criſtatus, or creſted dog's-tail graſs, grows in dry ſituations, and will not thrive in wet meadows: the ſtems are wiry, and the roots penetrating to no great depth, in dry ſummers it becomes little better than an annual.

Of the above ſix graſſes the ſecond and fourth are fitteſt for moiſt land; the firſt and fifth for land moiſt, or moderately dry; the third and ſixth for dry paſture. The order of their flowering is as follows: 1. Vernal. 2. Meadow fox-tail. 3. Smooth-ſtalked meadow. 4. Rough-ſtalked meadow. 5. Meadow feſcue. 6. Creſted dog's tail.—To theſe ſix graſſes we may add: 7. Avena elatior, or tall oat graſs. Early, very productive, and producing a plentiful aftermath.

8. Avena flaveſcens, or yellow oat graſs; affecting dry ſoils, rather early, and tolerably productive.

9. Bromus

9. Bromus mollis, or ſoft brome graſs: as an early graſs it might perhaps be cultivated to advantage; but with other graſſes it ſheds the ſeeds and withers, before the whole is ready for mowing.

10. Cynoſurus cæruleus, or blue dog's-tail graſs, is the earlieſt of all our graſſes, but not productive, or of a good quality.

11. Dactylis glomeratus, or rough cock's-foot graſs, is a rough coarſe graſs, extremely hardy and productive, common in orchards and meadows, and rather early.

12. Feſtuca ovina, or ſheep's feſcue graſs; native of dry elevated heaths and commons; a ſmall plant even in a rich ſoil.

13. Hordeum murinum, wall barley graſs, or ſquirrel-tail graſs. Common by walls and the ſide of paths. Among hay very injurious to horſes, by the awns or beards of the ears ſticking in their throats.

14. Hordeum pratenſe, or meadow barley graſs; taller and more delicate; ſometimes forming great part of the crop in good meadows; neither early nor very productive: it may poſſibly have the ſame bad quality as the foregoing.

15. Holcus lanatus, or meadow ſoft graſs. Hardy and productive; flowering a month later than the Anthoxanthum; foliage ſoft and woolly.

16. Holcus mollis, or creeping ſoft graſs. Grows well in ſandy ſoils, and bears drought.

17. Lolium perenne, or ray graſs; wiry with little foliage in upland paſtures; but in rich meadows its foliage is abundant and of rapid growth.

18. Poa annua, or dwarf meadow graſs; perpetually flowering and ſeeding moſt rapidly, unleſs prevented by cold; growing in almoſt any ſoil and ſituation, but never acquiring any great height; its foliage is tender and grateful to cattle, but liable to be killed by winter's froſt and ſummer's drought.

19. Phleum pratenſe, or meadow cat's-tail graſs; in wet ſituations very productive, but coarſe and late; it has no excellence which Alopecurus pratenſis does not poſſeſs in an equal or ſuperior degree.

20. Triticum repens, creeping wheat graſs, quick, quich or couch graſs. Too well known to farmers and gardeners as a moſt troubleſome and unprofitable graſs, though its foliage is early.

From the preceding liſts, Dr. Dickſon, in his "Syſtem of Modern Huſbandry," publiſhed in 1805,—(a work of abundant information, highly deſerving the attention of every agriculturiſt,) has ſelected the following as the moſt uſeful and beneficial to the generality of farmers and graziers, viz. the Sweet-ſcented Vernal Graſs; Meadow Fox-tail Graſs; Smooth-ſtalked Meadow Graſs; Rough-ſtalked Meadow Graſs; Meadow Feſcue Graſs; Sheep's Feſcue Graſs; Hard Feſcue Graſs; Creſted Dog's-tail Graſs; Ray or Rye Graſs; Meadow Soft Graſs, or Yorkſhire White; Rough Cock's-foot Graſs; Tall Oat Graſs; Meadow Cat's-tail or Timothy Graſs; the valuable artificial graſſes.

Sweet-scented Vernal Grass.

This graſs comes early into bloſſom, and is of courſe valuable as ſpring graſs, and alſo for its readineſs to grow in moſt kinds of ſoil and ſituation, being found in bogs, in woods of low growth, or which have had the underwood removed, in water meadows, and in dry paſtures; but in point of crop it is not ſo productive as ſome, yet more than ſo others: cattle are very fond of it, and it is the only graſs of this climate which is ſtrongly odoriferous; the agreeable ſcent of new-made hay being produced almoſt entirely by it; and the green leaves, when bruiſed, readily impart this odour to the fingers, by which means the foliage may conſtantly be known; and it may be readily diſtinguiſhed when in bloſſom, by its having only two threads or ſtamina to each flower. It thrives well even on poor ſandy ſoils.—See Anthoxanthum odoratum.

Meadow Fox-tail Grass.

This graſs ſends forth its ſpike almoſt as ſoon, and in ſome ſituations full as early, as the Sweet-ſcented Vernal: conſequently it is equally valuable as an early ſpring graſs; and as it is larger and quicker in its growth, it is of courſe much more productive: it ſhoots rapidly after mowing, producing a very plentiful aftermath: and where the land is rich, and two crops are not thought too much for it to bear, of all the graſſes of this climate it appears to be the moſt favourable for ſuch a purpoſe, and ought to form a principal part of the crop in ſuch caſes. Its foliage may ſeem coarſe to ſome; but it muſt be kept in mind that no graſs can be productive that is not in ſome degree coarſe. If it be mown early, juſt as it comes into bloom, though the leaves are large, the hay will not be coarſe. In general, the great advantage proceeding from the earlineſs of theſe two graſſes is entirely loſt in thoſe diſtricts where hay-making begins at a late period, and where a crop of indiſcriminate herbage is waited for by the cultivator. It is in ſome meaſure diſtinguiſhed by the largeneſs of its foliage, and by its producing a ſoft ſpike on a long ſtalk about the beginning of May. This is ſome objection to it, as the ſeed cannot be always obtained in plenty. On a ſituation where it was perfectly eſtabliſhed with thick herbage, it was found by Mr. Secretary Young to produce but few ſeed-ſtems.

In reſpect to the places of its growth, it is more confined than the firſt ſort, growing naturally in a moiſt ſoil only: on this account ſome think it beſt adapted for improving ſuch wet grounds as may be newly drained, or for forming or meliorating meadows that have a moiſt bottom, and are not apt to be burnt up in dry ſummer ſeaſons. Others, however, ſuppoſe that there is ſcarcely a better graſs for moiſt loams and clays, as it is extremely early; and abides nine or ten years on ſoils upon which the Meadow Feſcue gives way to thoſe of other kinds. It has likewiſe by ſome been found hardier againſt froſt and exceſſive cold. Others ſpeak of it as excellent, both for paſture and hay, as being highly productive, and the firſt as a dairy graſs. It has been obſerved that if ſown alone, and cut for hay, it dries in far leſs time than moſt other graſſes, and requires to be ricked ſooner, or its quality will be injured by too long expoſure. The ſeeds are eaſily collected, and by being ſown before the roller in the ſpring ſeaſon, will greatly improve moſt kinds of meadow and paſture lands. See Alopecurus pratenſis.

Smooth-stalked Meadow Grass.

This graſs alſo begins to ſhoot and to aſſume a beautiful verdure at an early period in the ſpring; but the flowering ſtems are not produced ſo ſoon, by a week at leaſt, as thoſe of the laſt: this ſlight difference, in point of carlineſs of flowering, does not, however, prevent it from being properly ranked with the two preceding graſſes. Where early paſturage is the great object of the cultivator, it cannot be better obtained than by a judicious combination of theſe three graſſes. If quantity of crop be at the ſame time in view, the Meadow Fox-tail Graſs ſhould predominate in a conſiderable degree. It in ſome meaſure prefers a rather dry than a moiſt ſituation, on which account it keeps its verdure in long-continued dry ſeaſons better than moſt other ſorts; but it is capable of thriving well in either ſituation, though more luxuriantly in rich meadows. It is conſidered as a highly valuable graſs, becauſe all animals are fond of it; and it affords ſome of the beſt hay, as well as the richeſt paſturage. In addition to its other qualities, it has the property of abiding continually in the ſame ground, while moſt other ſorts are liable to change. It is readily diſtinguiſhed from the Common Meadow Graſs, as it has a ſmooth ſtalk, while the other has a rough one, which is perceptible when drawn betwixt the thumb and finger, and which pro-

ceeds from little ſharp points, viſible when the ſheath of the leaf, which covers the ſtalk, is magnified: beſides, the latter has a long pointed membrane at the baſe of the leaf, while in the former it is a ſhort blunt one. And further, it only throws up flowering-ſtems or bents once in a ſeaſon; from which peculiarity, combined with its hardineſs and verdure, it appears well ſuited for the lawns or graſs-plats of pleaſure-grounds. This ſcantineſs of producing flowering ſtems is however unfortunate, inaſmuch as it renders its ſeed very ſcarce, and will not allow it to produce abundantly, even when ſown with this particular view.—See POA pratenſis.

ROUGH-STALKED MEADOW GRASS.

Though this graſs has much ſimilarity to the preceding in its appearance, eſpecially in the mode of flowering, it differs eſſentially in its qualities, as the former is chiefly found in dry paſtures, while the latter principally occurs in water-meadows. It delights in ſtrong loamy and clayey ſoils, and in ſituations that are ſheltered; on which account, though there are few more productive, or better adapted for the purpoſe of hay or paſturage, in dry ſoils it is tender, and liable to be injured by ſevere cold or froſt; and in moiſt rich ground it has been obſerved to grow tall, while in poor land it has been found equally diminutive and unproductive. On the continent it is greatly eſteemed both for dry paſtures and water-meadows, as it multiplies much by ſeed as well as root. It is therefore neceſſary to permit the ſeeds to fall, before mowing, in order to preſerve the quantity undiminiſhed. The produce is admirable for the feeding of all ſorts of cattle. It is, however, conſidered by ſome as inferior to the laſt ſort, from its property of going off after being cut, being ſupplanted by thoſe of the bent kind: but its radical as well as ſtem-leaves grow larger.—See POA trivialis.

MEADOW FESCUE GRASS.

This graſs comes near in its appearance to Ray Graſs, but to which it ſeems greatly ſuperior, at leaſt for the purpoſe of improving meadows; as being larger, and more productive of foliage. It is ſtrictly perennial and hardy, thriving well both in wet and dry grounds; and it abounds in the beſt meadows, in the beſt hay diſtricts: in ſhort, it ſeems well calculated to ſupply the defects of Ray Graſs. Beſides, it has the quality of producing more ſeeds than moſt of the other ſorts of natural graſſes, which are eaſily gathered, and grow readily. It is however inferior to the three firſt ſorts in one property, which is, that it does not produce its flowering-ſtems ſooner than about the middle of June, which is a fortnight or more later than the ſecond of them; though it cannot be conſidered as a late graſs, ſince thoſe of the bent and ſome other ſorts flower later by three weeks or more. Upon the whole, few of the natural graſſes merit the attention of the farmer and grazier more than this; it being of certain growth, eaſy culture, abundantly productive, and remarkably ſweet, in almoſt all deſcriptions of meadow or paſture land.—See FESTUCA pratenſis.

SHEEP'S FESCUE GRASS.

This ſpecies has been much valued both for the purpoſes of paſture and hay; ſheep and other ſorts of live ſtock, being very fond of it, are ſoon rendered fat in paſtures where it prevails. But from its often affording in dry heathy ſituations, and commons, rather a ſcanty produce, and its foliage being ſmall, it has been diſcouraged as a hay graſs. It is nevertheleſs ſaid to be capable of thriving on any ſoil, with proper care and culture; but beſt on thoſe of the light ſpongy kinds, ſince it can live with leſs moiſture than moſt other graſſes. And it is aſſerted to be one of the excellencies of this graſs, that it will eſtabliſh itſelf upon ſuch ſoils as ſcarcely any other plant can be made to live on; and is hence of much utility in clothing barren ſpots, that might otherwiſe have remained uncovered for a great length of time. Some agriculturiſts erroneouſly obſerve, that if it were ſown on rich moiſt ſoils, the graſſes and other plants, which are natural to ſuch lands and ſituations, would ſoon overpower it, and in a very ſhort time there would ſcarcely be a blade remaining on the ground; and were it for the purpoſe of ſheep-feed to be ſown on the high downs and heath lands, the animals would ſtarve upon them in dry ſummer ſeaſons. But this is certainly a great miſtake. Where a cloſe matted turf, without a great produce, is required, it will ever be found uſeful.—See FESTUCA ovina.

The *Hard Feſcue* is an early and more productive graſs, though with fine foliage; and grows abundantly on downs, and in rich meadows. It is well adapted for being combined with other graſſes in forming ſheep paſtures; and it helps to conſtitute the beſt hay.—See FESTUCA duriuſcula.

CRESTED DOG'S-TAIL GRASS.

This ſpecies is much recommended as a favourite and wholeſome food for ſheep. It is found in the foundeſt and richeſt paſtures, but grows beſt in dry ſituations, and will not thrive in meadows that are very moiſt. It flowers nearly at the ſame time as the Meadow Feſcue Graſs, but is not very abundant in foliage. The appearance of its bents in poor, high, moiſt paſtures, ſuggeſts an idea of its being an indifferent plant. But its abounding in moſt of the richeſt grazing paſtures in different parts of the kingdom, and its being in ſome the principal herbage, beſides that the butter made from paſtures where this graſs chiefly abounds being eſteemed excellent in flavour, proves that it is a valuable graſs. As its flowering ſtems and heads are ſeldom conſumed by cattle, its ſeeds may be collected, even where the paſtures are fed, with great eaſe and facility. On the continent it is in high eſtimation as a paſture graſs; yet from the fibrous nature of its roots, not admitting the running down much into the ſoil, there is danger of its being deſtroyed in dry ſummer ſeaſons. Since it abounds greatly in the beſt paſtures, and is a blade-graſs that ſhoots up the firſt after the land has been mown, its thickeſt tufts are ſaid to afford much food for ſheep in the time of ſnow and ſevere weather in the winter ſeaſon. Thoſe who are not accuſtomed to diſtinguiſh the difference of graſſes with botanical accuracy, may deſpiſe it, as of an improper and uſeleſs kind; but the ſheep and the ox, as better judges, will ſoon convince them of its importance. From the rapidity of its growth it is apt to get coarſe, if not cut down in proper time. The ſeed is ſmall and fine, yet may be obtained with facility by paſſing the ſtem in a tight manner through the hand.—See CYNOSURUS criſtatus.

RAY OR RYE GRASS.

This graſs is in conſtant cultivation, though it is deficient in ſome of the properties requiſite for meadow or paſture lands. The objection on the ſcore of its producing little more than flower-ſtems or bents, is ſaid to be only found valid when it grows in upland paſtures and dry ſituations: in rich and moiſt meadows its foliage is more abundant; and it ſeems probable that it is highly nutritious in feeding cattle: its foliage is of a rapid growth, the flowering ſtems continually ſhooting forth. It is, however, a graſs that varies greatly, according to ſituation and circumſtances. It ſeems beſt adapted to loamy and ſandy ſoils; but it will ſucceed on all except ſtiff clay, and even on that it may be grown. On the richer ſorts of the two firſt kinds of land, it frequently turns out both a good vernal and permanent paſture graſs, when properly mixed with other ſorts; and it is particularly adapted to the feed of ſheep. It is not, however, ſo early as ſome of the graſſes deſcribed above. As a ready means of converting

1. Sweet-scented vernal Grass. 2. Meadow Fox-tail Grass. 3 Smooth-stalked meadow Grass. 4. Rough-stalked meadow Grass. 5 Meadow fescue Grass. 6. Sheeps fescue Grass.

London. Published as the Act directs. August 25th 1807. by J. Wilkes.

GRASS.

7. Hard fescue Grass. 8. Crested Dogs-tail Grass. 9. Ray or Rye Grass. 10. Meadow soft Grass. 11. Rough Cocks-foot Grass. 12. Tall oat Grass. 13. Meadow Cats-tail Grass.

London. Published as the Act directs. August 29th 1807. by J. Wilkes.

ing arable into graſs, this ſpecies is invaluable. When land is in a proper ſtate of cultivation, ray-graſs, united with white clover, will form a perfect ſward the latter end of the ſecond year after it is ſown. For making into hay, it is neceſſary to cut it at a period previous to its being ſo ripe as to have perfected its ſeed, and changed its green colour; for in this caſe a great part of the juices of the plant, which conſtitute the nutriment it is to afford, will be abſorbed, and the ſtalk becomes a ſpecies of ſtraw, with all its nutritive properties diminiſhed. When it is made into hay, perſons not acquainted with its qualities are apt to object to its apparent coarſeneſs, which proceeds from its conſiſting almoſt entirely of flowering-ſtems, the Ray-graſs having a comparatively ſmaller proportion of leaves than moſt other graſſes. Whether this be a defect, or a merit, will depend upon a ſolution of this queſtion: Do the ſtems and flowering parts of graſs, or the leaves, taken weight for weight, contain the greater proportion of nutriment? It does not appear that this queſtion has been determined by experiments inſtituted for the purpoſe; but it ſeems probable, from the ſtems being ſo much ſweeter than the leaves, which is particularly perceptible upon chewing them when about half dry, and from thoſe vegetables which contain much ſaccharine matter being particularly nutritious, that the greater proportionate quantity of nutriment will be found to reſide in the ſtalks; and if ſo, the advantages of Ray-graſs become deciſive. But, however this be, it is certain that, ſuppoſing wet weather comes on during the proceſs of hay-making, the firſt part of the graſs that decays is the leaf, which ſoon turns yellow, and then black, loſing all its nutritive properties; in which caſe, it is evident that almoſt the whole nutriment contained in the hay muſt reſide, excluſively, in the flowering-ſtalks. Ray-graſs therefore has, in unfavourable hay ſeaſons, an advantage over all others, inaſmuch as, from having fewer leaves, it is not ſo apt to be injured by a continuance of rain: and it is beſides, when in the cocks, more acceſſible to the air and wind, from lying more open and light; and conſequently not ſo apt to heat and mould as other graſſes in ſimilar ſituations. Hence it appears that Ray-graſs poſſeſſes the following valuable properties: 1. That there are but few graſſes which come ſo early in the ſpring. 2. That there are none better reliſhed by cattle, or more nutritive. 3. That it has the power of reſiſting the effects of bad weather in a greater degree than other graſſes. 4. That there is a greater facility in collecting its ſeed, and ſtocking land therewith, than of any other graſs at preſent in cultivation.—See LOLIUM perenne.

MEADOW SOFT GRASS, OR YORKSHIRE WHITE.

This graſs is common in meadows and paſtures, and is both hardy and productive of foliage, but flowers much later than the firſt of the above graſſes: its foliage is ſoft and woolly; whence its characteriſtic name. It thrives beſt on ſoils of the moiſt kinds; but may be grown on almoſt any that are not very dry, and in poor condition; yet even on theſe it is ſometimes met with. By ſome cultivators it is chiefly adviſed to be made uſe of with a view to ſheep paſture, as not being found equally good for all other kinds of ſtock. For all purpoſes, however, it is found to anſwer beſt when kept very cloſely fed. It vegetates in a quick manner, and hence affords good ſheep-feed in the winter ſeaſon.—See HOLCUS lanatus.

ROUGH COCK'S-FOOT GRASS.

This is a coarſe ſpecies, though very hardy and productive. It is commonly found in meadows; and is rather early in its growth. Some condemn it as not only an indifferent graſs, but one that is often rejected by cattle. Others, however, on the authority of experience, conſider it as highly valuable on moiſt loams, where the bottom is of a clayey nature, and where graſſes that are of a finer kind are liable to be overpowered and deſtroyed by plants more common to ſuch ſoil. When it is kept cloſely fed down, it affords good paſturage for ſheep; but when this is neglected, like many other graſſes, it becomes coarſe: if ſown with red clover, in the proportion of two buſhels of the graſs-ſeeds to ten pounds of the clover, it forms a better ſward; and as the latter wears out or diſappears, the former reſumes its place, and thickly covers the land. It is alſo a graſs that vegetates better during the winter ſeaſon than many others. It affords much ſeed, and has therefore been found highly beneficial in affording early ſpring feed for ſheep.—See DACTYLIS glomerata.

TALL OAT GRASS.

This is almoſt every where found abundantly in meadows. It is indeed coarſe; but it is early and productive, and affords a plentiful aftermath. In value it approaches the Meadow Fox-tail, for which it may, in many caſes, be made a good ſubſtitute. It is cultivated on the continent with advantage. This, like the preceding graſs, is found the moſt beneficial when retained in a cloſe ſtate of feeding. It makes good hay, and experiment has ſhown it to afford a greater weight of produce than moſt other graſſes. See AVENA elatior.

MEADOW CAT'S-TAIL, OR TIMOTHY GRASS.

This graſs ſucceeds beſt in all moiſt ſoils and ſituations, is very productive, but coarſe and late. It poſſeſſes no advantages over the Meadow Fox-tail. It is the moſt proper for clays, the moiſter kinds of loams, and thoſe of the peat moor. On theſe ſoils it has been found very uſeful, eſpecially when kept cloſely fed down by ſheep. According to the accounts of travellers in America, it conſtitutes the principal ſupport of cattle and other animals, in their deep ſavannahs and lands of the natural meadow kind. It affords plenty of feed, of which a buſhel is ſaid to be ſufficient, when mixed with thoſe of other ſorts, to ſow four or five acres of land. This ſeed is now commonly imported from America.—See PHLEUM pratenſe.

Of thoſe great and valuable aids to the ſuſtentation of ſheep and cattle, called ARTIFICIAL GRASSES, Dr. Dickſon recommends the higheſt regard to the Dutch or white clover; for which ſee TRIFOLIUM *repens*: the marl-clover or cow-graſs; for which ſee TRIFOLIUM *medium*: the trefoil or black non-ſuch; for which ſee MEDICAGO *lupulina*: the bird's-foot trefoil; for which ſee LOTUS *corniculatus*: the true red clover; for which ſee TRIFOLIUM *pratenſe*: the French clover or ſaintfoin; for which ſee HEDYSARUM *onobrichis*: and the luxuriant lucern; for which ſee MEDICAGO *ſativa*; with the correſpondent Engravings to each genus.—And for the moſt improved methods of cultivation, both of the natural and artificial Graſſes, ſee the article HUSBANDRY.

To GRASS, *v. n.* To breed graſs; to become paſture:

Land arable, driven, or worn to the proof,
With oats ye may ſow it, the ſooner to *graſs*,
More ſoon to be paſture, to bring it to paſs. *Tuſſer.*

GRASS'-COCK, *ſ.* A ſmall heap of mowed graſs lying the firſt day to dry.

GRASS'-GREEN, *adj.* Green with graſs:

Ah! not the nymph ſo blooming and ſo gay,
That led the dance beneath the feſtive ſhade:
But ſhe, that in the morning of her day
Intomb'd beneath the *graſs-green* ſod was laid. *Shenſt.*

GRASS'-HEARTH, *ſ.* In the feudal law, the graſing or turning up the earth with a plough; whence the cuſtomary ſervice for the inferior tenants of the manor of Amerſden,

Amerſden, in Oxfordſhire, to bring their ploughs and do one day's work for their lord, was called *graſs-hearth* or *graſs-hurt*: and we ſtill ſay the ſkin is graſed, or ſlightly hurt; and a bullet graſes on any place, when it gently turns up the ſurface of what it ſtrikes upon. *Paroch. Antiq.* 496.

GRASS'-PLOT, *ſ.* A ſmall level covered with ſhort graſs.—The part of your garden next your houſe ſhould be a parterre for flowers, or *graſs-plots* bordered with flowers. *Temple.*—See the article HORTICULTURE.

GRASS WEEK, *ſ.* Rogation week, ſo called in the inns of court and chancery.

GRASSA'NO, a town of Italy, in the kingdom of Naples, and province of Baſilicata: eighteen miles eaſt-ſouth-eaſt of Cirenza.

GRASSA'TION, *ſ.* [from the Lat. *graſſor*, to aſſail.] The act of robbing; the act of laying waſte. *Bailey. Not ſufficiently authoriſed.*

GRASSE, a town of France, and principal place of a diſtrict, in the department of the Var; before the revolution the ſee of a biſhop, ſuffragan of Embrun. The principal trade of the inhabitants is in dry fruit, olives, oil, perfumes, and tanned leather: five leagues weſt-ſouth-weſt of Nice, and three weſt-north-weſt of Antibes. Lat. 43. 42. N. lon. 24. 35. E. Ferro.

GRASSE (La), a town of France, and principal place of a diſtrict, in the department of the Aude, ſituated on the river Orbien: fourteen miles ſouth-eaſt of Carcaſſone, and eighteen ſouth-weſt of Narbonne.

GRASSEL'LA, a town of France, and principal place of a diſtrict, in the department of the Aude: ſix leagues and three quarters ſouth-weſt of Narbonne, and eight and a half north-north-weſt of Perpignan. Lat. 43. 5. N. lon. 20. 17. E. Ferro.

GRASSE'NA, a town of Italy, in the duchy of Aoſta: eighteen miles eaſt of Aoſta.

GRAS'SETH ORTH, a town of Germany, in the archduchy of Auſtria: ſix miles ſouth-eaſt of Voglapruck.

GRASS'INESS, *ſ.* The ſtate of abounding in graſs.

GRAS'SY, *adj.* Covered with graſs; abounding with graſs:

Ne did he leave the mountains bare unſeen,
Nor the rank *graſſy* fens delights untry'd. *Spenſer.*

GRAS'WINKEL (Theodore), a learned civilian of the ſeventeenth century, born at Delft. He wrote various works upon legal and political ſubjects; by which he acquired ſo much reputation, that he was made fiſcal of the domains of the ſtates of Holland, and ſecretary of the bipartite chamber on the part of the ſtates-general. He died at Mechlin in 1666, and was buried in the great church at the Hague. In 1634 he publiſhed a work entitled, *Libertas Veneta, ſeu Venetorum in Se & Suos imperandi Jus*; and in 1644 he defended the republic of Venice in a diſpute with the duke of Savoy concerning precedence. For theſe ſervices that republic created him a knight of St. Mark. In 1642 he publiſhed a work, *De Jure Majeſtatis*; deſigned as a confutation of the popular maxims of Buchanan. This was dedicated to Chriſtina queen of Sweden, a great aſſertor of regal privileges. In a work entitled, *Maris Liberi Vindiciæ*, he maintained the liberty of the ſea againſt a Genoeſe named Burgus, who had followed the ſteps of Seldeh. He wrote a treatiſe in 1660, entitled, *De Preludiis Juſtitiæ & Juris*, together with a diſſertation, *De Fide Hereticis et Rebellibus Servanda*, intended to refute a Portugueſe Jeſuit. He alſo compoſed various Latin poems; and he wrote ſome works in the Dutch language, among which was a treatiſe On the Sovereignty of the States of Holland, 2 vols. 4to.

GRAT'CHI, a town of Ruſſia, in the country of Coſacs: twenty miles north-weſt of Tzaritzin.

GRATE, *ſ.* [*crates*, Lat.] A partition made with bars placed near to one another, or croſſing each other: ſuch as in cloiſters or priſons.—A fan has on it a nunnery of lively black-eyed veſtals, who are endeavouring to creep out at the *grates*. *Addiſon.*

Out at a little *grate* his eyes he caſt
Upon thoſe bord'ring hills, and open plain. *Daniel.*

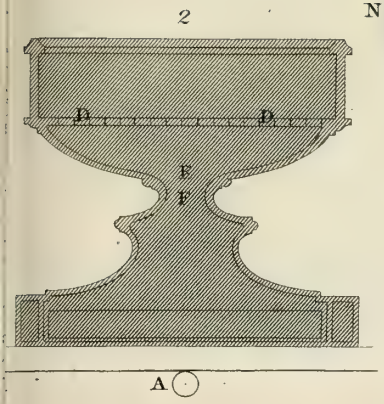
The range of bars within which fires are made.—An old faſhioned *grate* conſumes coals, but gives no heat. *Spectator.*

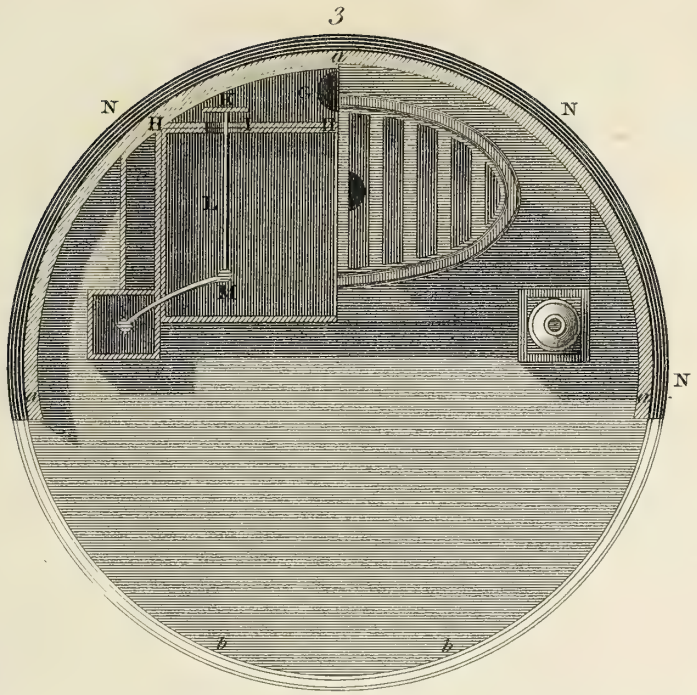
Among the numerous claſſes of new and valuable improvements, few are pregnant with more intereſt than thoſe which appertain to Grates and Stoves. For many of theſe the public are indebted to the philoſophic count Rumford; and, for one of very general utility, to Mr. James Burns of Glaſgow, which has been honoured by the protection of his majeſty's letters patent. The principal merit of Mr. Burns's invention, and it is by no means a trivial one, conſiſts in his contriving to maintain the combuſtion of the fuel in an *open* ſtove, without employing for that purpoſe the air of the room in which they are placed. The heat liberated and thrown out into the apartment is thus prevented from being waſted and hurried up the chimney, as is unavoidably the caſe in the common method, where the combuſtion is maintained by air from the apartment, the waſte of which is ſupplied by exterior cold air that comes pouring in at the bottom of the doors and the ſides of the windows, thereby undoing a great part of the effect produced by the fire.

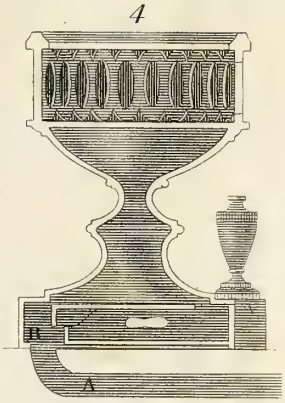
To prevent this waſte, the air that maintains the fire in Mr. Burns's grates, or in others to which his improvements are applied, ſhould be brought through a tube from the outſide of the houſe, or be made to paſs from the outſide of the houſe, between two of the joiſts, where the floors and ceilings are found enough to allow this, ſo as to be brought to the bottom bars of the grate, without having any communication with the interior air of the room, while at the ſame time the grates, and parts connected with them, ſhould be ſo conſtructed, that, when the fire is not wiſhed to be ſupplied with cold air from the outſide of the houſe, the paſſage may be ſhut more or leſs perfectly by means of a valve, a ſmall door, a cock, or any ſimilar contrivance. When convenience does not admit of the air-tube being carried to the outſide of the houſe, if carried to a cellar, larder, ſtair-caſe, or any lumber-room, the ſame end will be gained; with this further advantage, that ſuch cellar, larder, &c. will thereby be well ventilated, and prevented from acquiring or retaining any unhealthy or diſagreeable ſmells.

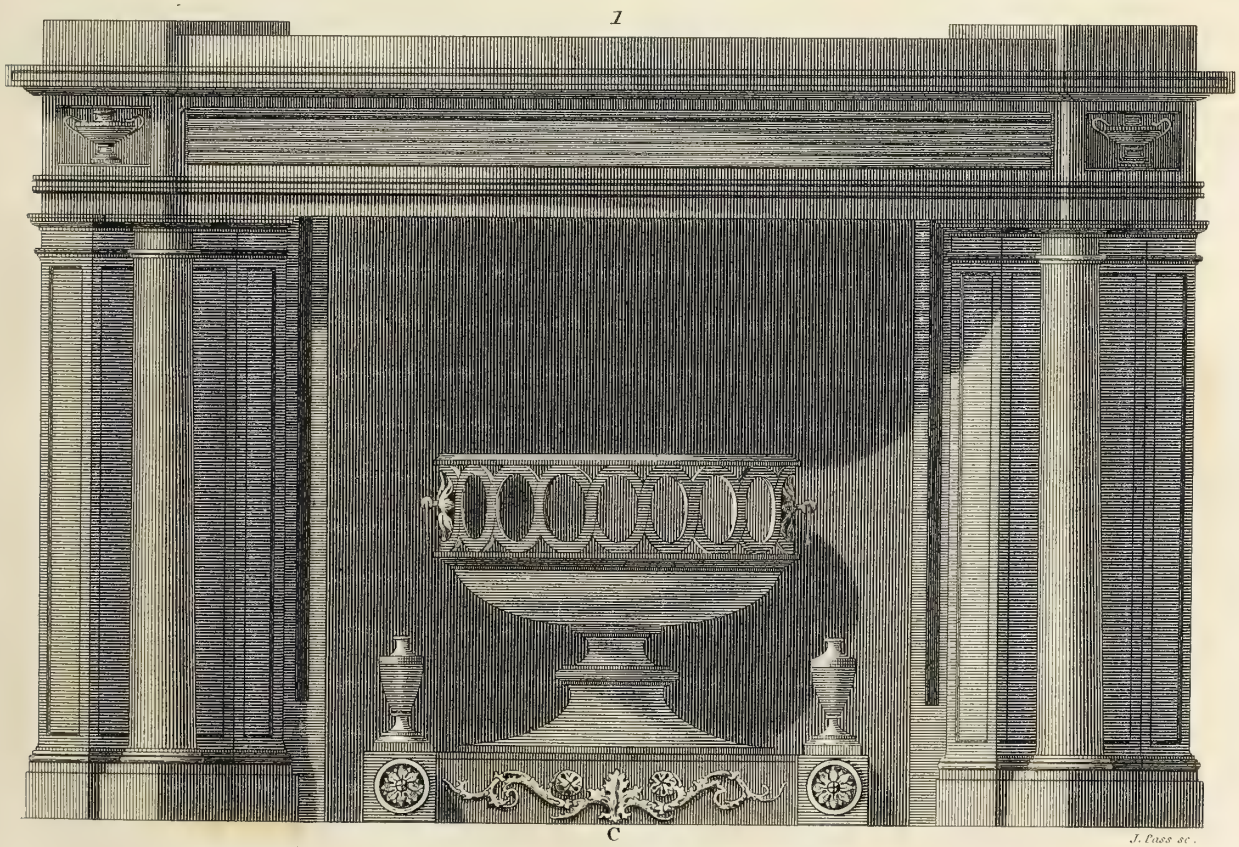
The form of the grates may be varied indefinitely; but the one here deſcribed anſwers the purpoſe ſo well, and is at the ſame time capable of being made, by the aid of a good architect, ſo highly ornamental to any apartment, that the reader will fully comprehend the facility with which it may be accommodated to circumſtances. Fig. 1, in the annexed Engraving, repreſents a grate of the improved conſtruction, and fig. 2, is a ſection of it. The air that maintains the combuſtion is ſupplied through the pipe or tube A, fig. 2 and fig. 4; or from between the under-ceiling and floor before-mentioned, from which it paſſes up by the back or ſide of a drawer, B, fig. 4, according as it is moſt convenient to bring it up by the one or the other; the back however is to be preferred, where convenience admits of it. The front of this drawer, in its place, is ſeen in fig. 1, at C. The intention of this drawer is to receive the aſhes that fall from the bottom bars of the grate, ſections of which are repreſented at DD, fig. 2. The aſhes, as they fall from the bars, ſtrike againſt the ſides of the internal cavity E, and are carried by their own gravity through the narrow part F, and fall into the drawer. This part of the conſtruction may be eaſily

GRATE.









Elevation and Section of Mr. Burns's Improved Grate.

London, Published as the Act directs, Novr 29th 1806, by J. Wilkes.

underſtood by conceiving it to be an hollow vaſe, as it actually is, with a drawer in its pedeſtal or baſement, and having a grate over it, on which the fire reſts. The valve, door, cock, or other contrivance by which the external air is admitted or excluded, may be either in the neck F of the vaſe, or in the air-tube, or in the drawer B, fig. 4, or C, fig. 1, or, which is preferable, in the cavity behind the drawer, the pedeſtal or baſement of the vaſe being made large enough to admit of ſuch cavity. Various conſtructions may be reſorted to; but that repreſented in fig. 3 (which is a ground-plan of a proper chimney for ſuch a grate, and in which a bird's-eye view of one half of the grate may be ſeen in its place, while the other half repreſents an horizontal ſection of the baſement or pedeſtal, which is ſuppoſed to be open, ſhewing the drawer in its place, with the cavity behind it) will be found to anſwer every purpoſe. The cavity G is ſeparated from the place in which the drawer is put, by a partition (beſt made of plate or caſt-iron) paſſing from H to H, in which there is an opening at I, with a cover at K. To the cover K is attached a ſmall bar L, worked by another ſhorter bar M, to which it is attached by any ſimple joint. The bar M is faſtened into an upright pivot, the top of which comes up through the pedeſtal at one of its corners, or any other convenient ſpot, and is furniſhed with a button to be laid hold of by the finger and thumb, or with a top fitted to a key, by the turning of which the cover K is made to ſhut or open the aperture I, and conſequently to prevent or facilitate the paſſage of the air from the hole at G, which repreſents the internal mouth of the air-tube, the other end of which is on the outſide of the houſe, or in any cellar or other apartment, as before deſcribed. When the air has paſſed through the aperture I, it finds no difficulty in paſſing on to the bottom of the grate, that back or ſide of the drawer next which the aperture is placed being made low to allow it to flow in freely.

The grates are recommended to be made of an elliptical form, as ſhewn at fig. 1; or circular, as at fig. 4; theſe being found moſt convenient, where a fence or ſcreen is wiſhed to be applied along with Mr. Burns's other improvements. The fence or ſcreen is intended to prevent thoſe dreadful accidents which too frequently occur, of women's and children's clothes being ſet on fire by ſparks from the grate. When it is wiſhed to be adopted, the inſide of the chimney, where the grate is to ſtand, ſhould be a ſemi-cylinder, or nearly ſo, as repreſented at fig. 3, with a lining or cover *aaa*, beſt made of metal, at ſuch a diſtance from the ſemi-cylindrical wall, NNNN, as to give ſufficient room for allowing the ſafeguard or fence to be ſlid round into it when the fire is wiſhed to be left open, when freſh fuel is to be added, or when the drawer with the aſhes is to be removed.

The fence is a frame-work of metal, which, when filled up with glaſs or with wire-work, forms a portion of a cylinder anſwerable to the curvature of the ſpace between the back of the chimney and the lining abovementioned, made in one or more pieces, and moving in a circular groove, *bb*, in or upon the hearth, which ſerves to conduct it into its place behind the grate, when the fire-place is wiſhed to be left open, as beforementioned. The top of the front of the opening of the chimney projects in a circular form, or is furniſhed with an added projection, made of metal, marble, or any other fit material; but in either caſe the projection is furniſhed with a circular groove on its under ſurface, of the ſame radius with the one in, or planted on, the hearth, for the purpoſe of receiving the upper part of the frame-work of the fence or ſafeguard, which frame-work may be filled up with glaſs, either plain or bent, and either colourleſs or coloured, or ſtained or painted with figures or deſigns of any kind. By this means complete ſafety is obtained againſt any ſuch accidents as have been alluded to, while at the ſame time the comfort ariſing from the view of a cheerful fire is not prevented by the interpoſition of any opake body; but in nurſeries, &c. where convenience and ſafety is more the object than elegance or luxury, the frame-work may be filled up with wire-work.

Where either the glaſs or the wire-work fence, or both of them, are meant to be applied to ſquare or rectangular chimneys, without the trouble of giving them the ſemi-cylindrical form, the lining to receive the fence or fences may be introduced at the ſides or jambs of ſuch chimneys; or the fence may be made to riſe by means of pulleys into the wall above the opening, or ſlide ſideways into the walls at the ſides of the opening. Theſe improvements may be introduced together or ſingly, and may be applied to many of the grates now in common uſe.

Beſides the advantages already pointed out as connected with them, they poſſeſs alſo the following.—Any room or apartment may be heated by their means with a much ſmaller quantity of fuel than by any other method yet in uſe: at the ſame time the advantage of ſeeing the fire is not loſt, as in cloſe ſtoves; for theſe grates have ſide as well as bottom bars, which allow the radiant heat and light to be thrown out into the room without any impediment: and in fact large rooms, halls, and the like, which by the uſual methods can hardly be warmed, or made at all comfortable in cold weather, may, by means of theſe improvements, be heated as effectually as the ſmalleſt apartment; for, when their full effect is wanted to be produced, it is only neceſſary to keep the fence in its receſs, that even that portion of heat which would be kept back by the interpoſed glaſs or wire-work, may be thrown out into the room, and perform its office. They are alſo an effectual cure for ſmoky chimneys, which not only cauſe great waſte and deſtruction of good furniture, but many diſeaſes to the inhabitants of houſes plagued with that evil. They cauſe a clean fire ſide to be eaſily commanded at all times, as hardly any of the duſt or aſhes fall through the ſide bars, almoſt the whole paſſing through the bottom bars down into the drawer; and any fire lighted in ſuch improved grates burns up and becomes lively in a few minutes without the aid of bellows, and that watchful care which common grates or ſtoves require.

Although theſe inventions are new to us in England, the idea perhaps of many of them was borrowed from our neighbours on the continent. The Swedes appear to have been the firſt who diſcovered (in 1766) the method of animating the flame by concealed tubes, which gave alſo the additional advantage of conveying away the noxious vapour with which all materials for domeſtic burning are impregnated. And the improved grate of Mr. Burns appears to ſavour much in its advantages and general utility with the *calorifere* or grate of Meſſrs. Olivier and Guiton, ſome time ſince recommended to public encouragement by the National Inſtitute of Paris. This calorifere poſſeſſes the following advantages: 1. The tube of the chimney is reduced to ſo ſmall a ſize, that the eſcape of the ſmoke into the apartment is impoſſible. 2. The apparatus burns the combuſtibles introduced into it without waſte, to an impalpable powder or perfect aſh. 3. It emits all the heat into the room, without admitting any portion of it uſeleſsly to eſcape. 4. The heat is capable of being regulated to any degree of the thermometer required. 5. A very ſmall quantity of wood is ſufficient to warm a large apartment for twelve hours. 6. The fire is always viſible to every perſon in the room. 7. The chimney is externally preſerved in its uſual form, and is ſtill capable of receiving all thoſe embelliſhments which wealth can ſupply, or art contrive.

To GRATE, *v. a.* [*gratter*, Fr.] To rub or wear any thing by the attrition of a rough body.—Thereat the fiend his gnashing teeth did *grate*. *Spenser.*

Blind oblivion swallow'd cities up,
And mighty states characterless are *grated*
To dusty nothing. *Shakespeare.*

To offend by any thing harsh or vexatious.—They have been partial in the gospel, culled and chosen out those softer and more gentle dictates which would less *grate* and disturb them. *Decay of Piety.*

Just resentment and hard usage coin'd
Th' unwilling word, and *grating* as it is,
Take it, for 'tis thy due. *Dryden.*

To form a sound by collision of asperities or hard bodies.—The *grating* shock of wrathful iron arms. *Shakesp.*

On a sudden open fly,
With impetuous recoil and jarring sound,
'Th' infernal doors, and on their hinges *grate*
Harsh thunder. *Milton.*

To GRATE, *v. n.* To rub hard so as to injure or offend; to offend, as by oppression or importunity.—Paradoxing is of great use; but the faculty must be so tenderly managed as not to *grate* upon the truth and reason of things. *L'Estrange.*

What peer hath been suborn'd to *grate* on you,
That you should seal this lawless bloody book
Of forg'd rebellion with a seal divine? *Shakespeare.*

To make a harsh noise, as that of a rough body drawn over another.—We are not so nice as to cast away a sharp knife, because the edge of it may sometimes *grate*. *Hooker.*

GRA'TE-WORK, *s.* A kind of work formed of bars put near to each other; lattice work.

GRA'TEFUL, *adj.* [*gratus*, Lat.] Having a due sense of benefits; willing to acknowlege and to repay benefits.—When some degree of health was given, he exerted all his strength in a return of *grateful* recognition to the author of it. *Fell.*

Years of service past,
From *grateful* souls exact reward at last. *Dryden.*

Pleasing; acceptable; delightful; delicious.—A man will endure the pain of hunger and thirst, and refuse such meats and drinks as are most *grateful* to his appetite, if he be persuaded that they will endanger his health. *Wilkins.*

Now golden fruits on loaded branches shine,
And *grateful* clusters swell with floods of wine. *Pope.*

GRA'TEFULLY, *adv.* With willingness to acknowledge and repay benefits; with due sense of obligation:

In Cyprus long by men and gods obey'd,
The lover's toil she *gratefully* repaid. *Granville.*

In a pleasing manner.—Study detains the mind by the perpetual occurrence of something new, which may *gratefully* strike the imagination. *Watts.*

GRA'TEFULNESS, *s.* Gratitude; duty to benefactors. *Obsolete:*

Blessings beforehand, ties of *gratefulness*,
The sound of glory ringing in our ears. *Herbert.*

Quality of being acceptable; pleasantness.

GRA'TELEY, an ancient village in Hampshire, on the south-east side of Quarley hill, in the road from Andover to Salisbury, where, in 926, king Athelstan held a grand council of the nobility. Near it are the vestiges of a great Roman camp, and on Quarley hill of a large British camp.

GRATE'OLENT, *adj.* [from the Lat. *gratus*, pleasing, and *oleo*, to smell.] Smelling gratefully.

GRA'TER, *s.* [*gratoir*, Fr.] A kind of coarse file with which soft bodies are rubbed to powder.

So it is with common natures,
Treat them gently they rebel;
But be rough as nutmeg-*graters*,
And the rogues obey you well. *A. Hill.*

GRA'TIAN, a native of Pannonia, father to the emperor Valentinian I. He was raised to the throne, though only eight years old; and after he had reigned for some time conjointly with his father, he became sole emperor of Rome in the sixteenth year of his age. He soon after took, as his imperial colleague, Theodosius, whom he appointed over the eastern parts of the empire. His courage in the field is as remarkable as his love of learning, and fondness of philosophy. He slaughtered thirty thousand Germans in a battle, and supported the tottering state by his prudence and intrepidity. His enmity to the pagan superstition of his subjects proved his ruin; and Maximinus, who undertook the defence of the worship of Jupiter and of all the gods, was joined by an infinite number of discontented Romans, and met Gratian near Paris in Gaul. Gratian was forsaken by his troops in the field of battle, and was murdered by the rebels, A. D. 383, in the 24th year of his age. See the article ROME.

GRA'TIAN, an Italian benedictine monk of the twelfth century, famed for having made the first collection of canons that was ever used as a text-book in the public schools. He was a native of Chiusi in Tuscany, and embraced the monastic life in the convent of St. Felix at Bologna. Before his time there had not been wanting collections of canons, or laws of the church, compiled by different individuals; but they were so destitute of order and method, and so defective both in matter and form, that they could not be conveniently explained in the schools, or made use of as systems of ecclesiastical polity. This circumstance induced Gratian to undertake the task of compiling such a system; and, after a labour of more than twenty-four years, he produced, in 1151, an abridgment of canon law, drawn from the letters of the pontiffs, the decrees of councils, and the writings of the ancient doctors, which in the first edition was entitled, *Concordantia discordantium Canonum*, or The Coalition of jarring Canons; and was afterwards called *Decretum Gratiani*, or Gratian's Decretal. The professors of Bologna were the first who adopted it as their text-book in their public lectures; and their example was soon followed by the professors at Paris. The abbé Fleury, in his excellent Discourse on Ecclesiastical History, has passed a very dispassionate judgment on its merits. The first printed edition of this work was published at Mentz, in 1472, folio; which was followed by impressions at Venice in 1476, and Paris in 1508. In 1580 an edition of it was published at Rome, with the approbation of pope Gregory XIII. in 4 vols. folio, on which much labour had been bestowed during the pontificates of his predecessors, popes Pius IV. and V. with the view of correcting its numerous faults. While the Roman edition was preparing for the press, the celebrated Anthony Augustin, archbishop of Tarragona in Spain, published a valuable treatise, *De Emendatione Gratiani*, of which the most accurate edition is that published at Paris by M. Baluze, in 1672, 8vo. with notes.

GRATICULA'TION, *s.* [from *grate*.] The act of dividing a design into squares in order to divide it. *Scott.*

GRATIFI'CATION, *s.* [*gratificatio*, Lat.] The act of pleasing.—They are incapable of any design above the present *gratification* of their palates. *South.*—Pleasure; delight.—How hardly is his will brought to change all its desires and aversions, and to renounce those *gratifications* in which he has been long used to place his happiness. *Rogers.*—Reward; recompence.

GRATIFICA'TOR, *s.* [from *gratify*.] One that gratifies. *Scott.*

To GRAT'IFY, *v. a.* [*gratificor*, Lat.] To indulge; to grant by compliance:

You ſteer between the country and the court;
Nor *gratify* whate'er the great deſire,
Nor grudging give what public needs require. *Dryden.*

To delight; to pleaſe; to humour; to ſooth.—A palled appetite is humorous, and muſt be *gratified* with ſauces rather than food. *Tatler.*

At once they *gratify* their ſcent and taſte,
While frequent cups prolong the rich repaſt. *Pope.*

To requite with a gratification: as, I'll *gratify* you for this trouble.

GRA'TING, *ſ.* On-board a ſhip, a kind of grate-work on the upper deck. The act of rubbing againſt ſome rough body.

GRA'TINGLY, *adv.* Harſhly; offenſively.

GRATI'OLA, *ſ.* [dimin. from *gratia*, on account of its ſuppoſed medicinal good qualities.] In botany, a genus of the claſs diandria, order monogynia, natural order perſonatæ, (ſcrophulariæ, *Juſſ.*) The generic characters are—Calyx: perianthium five-parted, upright: ſegments awl-ſhaped, permanent. Corolla: monopetalous, unequal; tube longer than the calyx; border four-parted, ſmall; the upper ſegment broader, emarginate, reflex; the reſt ſtraight, equal. Stamina: filaments four, awl-ſhaped, ſhorter than the corolla, the two lower ſhorter than the others, and barren; the two upper faſtened to the tube of the petal; antheræ roundiſh. Piſtillum: germ conic; ſtyle ſtraight, awl-ſhaped; ſtigma two-lipped, after fecundation converging. Pericarpium: capſule ovate, acuminate, two-celled, two-valved. Seeds very many, ſmall. The eſſence of the character conſiſts in the two barren antheræ.—*Eſſential Character.* Calyx, ſeven-leaved, the two outer leaves patulous; corolla, irregular, reverſed; ſtamina, two, barren; capſule, two-celled.

Species. 1. Gratiola officinalis, officinal gratiola, hedge hyſſop, or water hyſſop: leaves lanceolate, ſerrate; flowers peduncled. Root perennial, creeping, thick, fleſhy, with many ſlender fibres; ſtalks ſeveral, upright, a foot or more in height, ſmooth, jointed; leaves oppoſite, ſeſſile, pointed, bright green, ſmooth, two inches long, and two lines or more in breadth, with a few ſmall ſerratures towards the end; flowers ſolitary, axillary, upright, on peduncles half an inch long, appearing in June or July, and continuing to Auguſt: calyx uſually ſeven-cleft; corolla ſhaped like that of the foxglove, but ſmall and of a pale yellowiſh colour, or pale purple with red ſtreaks, ſometimes white; the throat is hairy. Native of the ſouth of Europe in paſtures, uſually ſuch as are moiſt. Common in many parts of Switzerland, Carniola, Auſtria in the palatinate, Sileſia, France, about Turin, Padua, and in other parts of Italy. It has a ſtrong bitter nauſeous taſte, and is much recommended by ſeveral eminent medical writers in dropſical caſes. It is a powerful cathartic, but is ſaid generally to occaſion vomiting. On account of its bitterneſs, cattle reject it; inſomuch that Haller aſſures us there are meadows about Yverdun entirely uſeleſs from the abundance of this plant. It was cultivated in our gardens as early at leaſt as 1568.

2. Gratiola monnieria, or thyme-leaved gratiola: leaves oval-oblong; peduncles one-flowered; ſtalk creeping. This ſmall creeping plant ſticks very cloſe to the ground, and caſts a few ſlender fibres from every joint as it creeps. The whole plant ſeldom exceeds ſeven or eight inches in length, but it generally grows in beds, and ſpreads thick upon the ground, throwing out a few ſimple ſide-branches, which give it a pretty appearance when it flowers, and make it exceedingly remarkable. Native both of the Eaſt and Weſt Indies, and the South-Sea iſlands; in low moiſt ſoils. Flowers from July to September. The name of *monnieria* was given to this plant in honour of Dr. Monier by Juſſieu, who raiſed it in the botanic garden at Paris.

3. Gratiola repens, or creeping gratiola: leaves ovate; ſtem creeping; calyx five-leaved; ſtyle bifid. Native of Jamaica.

4. Gratiola rotundifolia, or round-leaved gratiola: leaves ovate, three-nerved. Stems a finger high, quadrangular, ſmooth, creeping at the baſe. Native of Malabar, in ſandy grounds.

5. Gratiola hyſſopioides, or hyſſop-leaved gratiola: leaves ovate-lanceolate, ſubſerrate, much ſhorter than the internodes. Stem filiform, upright, ſmooth, a foot high. Native of the rice-grounds of Tranquebar in the Eaſt Indies.

6. Gratiola Virginica, or Virginian gratiola: leaves lanceolate, obtuſe, ſomewhat toothed. Stem procumbent, varying much in ſize. The corolla is white, and the flowers are not followed by ſeeds in England. It grows naturally in North America, in moiſt places, where it riſes more than a foot high, but here not more than eight inches. It is alſo native of Malabar.

7. Gratiola Peruviana, or Peruvian gratiola: flowers ſubſeſſile. This plant grew here about nine inches high, with a weak ſtalk; leaves oppoſite, ſerrate, three quarters of an inch long, and half an inch broad; the flowers come out ſingle on each ſide the ſtalk, they are white and much ſmaller than thoſe of the common ſort. Mr. Mi'ler received the ſeeds from Carthagena in New Spain, where it was found in places where there had been ſtanding waters, which were then dried up. He cultivated it in 1759; but the ſeeds not ripening it was ſoon loſt.

8. Gratiola lobelioides, or lobelia gratiola: ſtem almoſt naked, ſtipuled; leaves oblong, quite entire; panicle dichotomous; capſules ſubglobular. Roots numerous, in bundles, ſhort, ſimple; ſtalk ſimple, upright, round, having an obſcure broad furrow on each ſide, ſlightly ſtreaked, ſmooth, with five ſtipuled joints, a foot high; leaves above the ſecond or third pair oppoſite, ſeſſile, upright, with the tips a little bowed back, acute, ſlightly ſtreaked, ſmooth on both ſides, an inch long, ſometimes coloured at the baſe, eſpecially underneath. Very common near Tranquebar, in rice fields.

9. Gratiola grandiflora, or great-flowered gratiola: ſtems decumbent; leaves ovate, ſerrate; peduncles oppoſite; capſules ſubulate. Stems bifid, angular, ſmooth; leaves oppoſite, ſerrate, often crenate, ſmooth; flowers large in proportion to the other parts. Native of Tranquebar, Madras, Siam, Malacca, in moiſt fat ſoils.

10. Gratiola veronicifolia, or veronica-leaved gratiola: ſtem creeping; leaves ovate-lanceolate, ſharply ſerrate; flowers terminating, oppoſite. Stems angular, diffuſed, procumbent; leaves oppoſite, ſeſſile; flowers ſmall, deep blue, bracted and peduncled. Inhabits with the foregoing.

11. Gratiola oppoſitifolia, or oppoſite-leaved gratiola: ſtem aſcending; leaves lanceolate, ſerrate; peduncles oppoſite to the leaves. Native of Tranquebar, in rice-grounds and moiſt places.

12. Gratiola ſtricta, or narrow gratiola: leaves ovate; ſpike long, terminating. Stem ſuffruticoſe, quite ſimple, erect, a foot and half high; flowers white dotted with red. Native of Cochinchina.

Propagation and Culture.—The firſt and fifth ſorts are eaſily propagated by parting the roots in autumn, when the ſtalks decay; the plants ſhould have a moiſt ſoil and a ſhady ſituation, for in dry ground they often decay in ſummer, unleſs they are plentifully watered. The other ſorts are natives of hot climates, and little known in Europe. See HOTTONIA INDICA, LINDERNIA, MIMULUS, CAPRARIA, DIANTHERA, and JUSTICIA.

GRATIO'SA,

GRATIO'SA, one of the ſmaller Canary iſlands, ſituated in the Atlantic. Lat. 29. 15. N. lon. 13. 7. W. Greenwich.

GRATIO'SA, one of Azores iſlands; about ten miles long, and eight broad; taking its name from its beauty and fertility in corn, fruit, paſture, and cattle, ſupplying Tercera and ſeveral of the other iſlands with a great part of its produce. It is well peopled, and has a number of villages, with forts for the defence of the coaſt. The principal place is La Plata. Lat. 39. 2. N. lon. 10. 12. W. Ferro.

GRATIOS'ITY, *ſ.* Grace; favour; civility. *Bailey. Not ſufficiently authoriſed.*

GRATIO'SO, *adj.* [Italian.] In muſic books; pleaſing; grateful.

GRA'TIS, *adv.* [Latin.] For nothing but thanks; without a recompence.—Kindred are no welcome clients, where relation gives them a title to have advice *gratis*. *L'Eſtrange.*

The people cry you mock them; and, of late,
When corn was given them *gratis*, you repin'd. *Shakeſp.*

GRAT'ITUDE, *ſ.* [*gratitudo*, low Latin.] Duty to benefactors:

Suſpicious thoughts his penſive mind employ,
A ſullen *gratitude*, and clouded joy. *Harte.*

Deſire to return benefits.—The debt immenſe of endleſs *gratitude*. *Milton.*—*Gratitude* is properly a virtue, diſpoſing the mind to an inward ſenſe and an outward acknowledgment of a benefit received, together with a promptneſs or readineſs to return the ſame. *South.*

GRA'TIUS, furnamed from the place of his birth FALISCUS, a Roman poet, contemporary with Virgil. His work, entitled *Cynegeticon* or The Art of Hunting with Dogs, lay unknown to the moderns till 1534, in which year it was printed by Paul Manutius, from a manuſcript brought by Sannazaro from France. It is written with a purity not unworthy of the Auguſtan age; but its ſubject does not admit of elegant poetry. The beſt edition is that of Leipſic, 1659, 4to. with the notes of Janus Ulitius. It is alſo printed in the collection of *Rei Venaticæ Scriptores*, *Amſt.* and *Leyd.* 1728, and in Mattaire's *Corpus Poetarum*.

GRATU'ITOUS, *adj.* [*gratuitus*, Lat. *gratuit*, Fr.] Voluntary; granted without claim or merit.—We miſtake the *gratuitous* bleſſings of heaven for the fruits of our own induſtry. *L'Eſtrange.*—Aſſerted without proof.—The ſecond motive they had to introduce this *gratuitous* declination of atoms, the ſame poet gives us. *Ray.*

GRATU'ITOUSLY, *adv.* Without claim or merit. Without proof.—I would know whence came this obliquity of direction, which they *gratuitouſly* tack to matter: this is to aſcribe will and choice to theſe particles. *Cheyne.*

GRATU'ITOUSNESS, *ſ.* The ſtate or quality of being gratuitous. *Scott.*

GRATU'ITY, *ſ.* [*gratuité*, Fr.] A preſent or acknowledgment; a free gift.—He uſed every year to preſent us with his almanac, upon the ſcore of ſome little *gratuity* we gave him. *Swift.*

To GRAT'ULATE, *v. a.* [*gratulor*, Lat.] To congratulate; to ſalute with declarations of joy:

To gratify the good Andronicus,
And *gratulate* his ſafe return to Rome,
The people will accept whom he admires. *Shakeſpeare.*

To declare joy for; to mention with expreſſions of joy:

Yet give thy jealous ſubjects leave to doubt,
Who this thy 'ſcape from rumour *gratulate*,
No leſs than if from peril; and devout,
Do beg thy care unto thy after ſtate. *Ben Jonſon.*

GRATULA'TION, *ſ.* [from *gratulatio*, Lat.] Salutations made by expreſſing joy; expreſſion of joy.—They are the firſt *gratulations* wherewith our Lord and Saviour was joyfully received at his entrance into the world. *Hooker.*

The earth
Gave ſigns of *gratulation*, and each hill. *Milton.*

GRAT'ULATORY, *adj.* Congratulatory; expreſſing congratulation.

GRATZ, or GRAZ, a town of Germany, in the duchy of Stiria, ſituated on the river Muehr. It contains ſeveral churches and convents, an arſenal, a caſtle on a rock, and an univerſity founded in 1585. The aſſembly of the ſtates is held here, and in 1784 it was erected into an archbiſhopric on the ſuppreſſion of that of Goritz. Firſt ſurrounded with walls by Ferdinand IV. which were greatly improved by the archduke Charles and his ſon Ferdinand. It was taken by the French republican army in March 1797. Seventy miles ſouth-ſouth-weſt of Vienna, and twenty ſouth-ſouth-eaſt of Pruck. Lat. 47. 10. N. lon. 33. 22. E. Ferro.

GRATZ, a town of Sileſia, in the principality of Troppau, ſituated on the Mora: four miles ſouth of Troppau.

GRATZARNIT'ZA, a town of Boſnia: thirty miles north-north-eaſt of Serajo.

GRAT'ZEN, a town of Bohemia, in the circle of Bechin: eighteen miles eaſt of Crumau, and ſeventeen north-eaſt of Roſenberg.

GRAU'DENTZ, or GRUDFIANDS, a town of Pruſſia, in the territory of Culm: fourteen miles north-north-eaſt of Culm.

GRA'VA-SE'LE, a town of Italy, in the kingdom of Naples, and province of Baſilicata: fifteen miles eaſt of Venoſa.

GRAVE, a final ſyllable in the names of places, is from the Saxon ȝnæf, a grove or cave. *Gibſon.*

GRAVE, *ſ.* [ȝnæf, Sax.] The place in the ground in which the dead are repoſited.—A flood of waters would overwhelm all thoſe fragments which the earth broke into, and bury in one common *grave* all the inhabitants of the earth. *Burnet.*

Now it is the time of night,
That the *graves*, all gaping wide,
Every one lets forth his ſpright,
In the church-way paths to glide. *Shakeſpeare.*

GRAVE, or GREVE, *ſ.* [ȝeneꝼe, Sax. a governor, *graave*, Germ. a viſcount.] A German title, ſignifying a great lord, count, or governor.

To GRAVE, *v. a.* preter. *graved*; part. paſſ. *graven*; [*graver*, Fr. γραφω, Gr.] To inſculp; to carve a figure or inſcription in any hard ſubſtance:

Thy ſum of duty let two words contain;
O! may they *graven* in thy heart remain!
Be humble, and be juſt. *Prior.*

To carve or form.—What profiteth the *graven* image, that the maker thereof hath *graven* it? *Hab.* ii. 18.—To copy paintings upon wood or metal, in order to be impreſſed on paper.—The *gravers* ought to imitate the bodies of the colours by the degrees of the lights and ſhadows: 'tis impoſſible to give much ſtrength to what they *grave*, without imitating in ſome ſort the colour of the objects. *Dryden.*

[From *grave*.] To entomb. *Not in uſe.*

Do you damn others, and let this damn you:
And ditches *grave* you all! *Shakeſpeare.*

To clean, caulk, and ſheath, a ſhip. *Ainſworth.*

To GRAVE, *v. n.* To write or delineate on hard ſubſtances.—Thou ſhalt make a plate of pure gold, and *grave* upon it. *Ex.* xxviii. 36.

GRAVE, *adj.* [*grave*, Fr. *gravis*, Lat.] Solemn; ſerious; ſober; not gay; not light or trifling.—They have as much reaſon to pretend to, and as much neceſſity

ſity to aſpire after, the higheſt accompliſhments of a Chriſtian and ſolid virtue, as the *graveſt* and wiſeſt among Chriſtian philoſophers. *Law.*

Youth on ſilent wings is flown;
Graver years come rolling on. *Prior.*

To laugh, were want of goodneſs and of grace;
And to be *grave*, exceeds all power of face. *Pope.*

Of weight; not futile; credible.—The Roman ſtate was of all others the moſt celebrated for their virtue, as the *graveſt* of their own writers, and of ſtrangers, do bear them witneſs. *Grew.*—Not ſhowy; not tawdry: as, a *grave* ſuit of clothes. Not ſharp of ſound; not acute.—Accent, in the Greek names and uſage, ſeems to have regarded the tone of the voice; the acute accent raiſing the voice, in ſome ſyllables, to a higher, i.e. more acute, pitch or tone, and the *grave* de preſſing it lower, and both having ſome emphaſis, i.e. more vigorous pronunciation. *Holder.*

GRAVE, a ſtrong town or city of Brabant, belonging to the Dutch, ſituated in a marſhy country, on the ſouth ſide of the Meuſe. Before the year 1323, it was a freehold belonging to Otho, the lord of Cuyck and Heverlé, who delivered it that year into the hands of John III. duke of Brabant, with power to hold as a fief according to the cuſtoms of Brabant. It had a fortreſs more ancient than the town itſelf, where the lords of Cuyck made their ordinary reſidences, but that has been deſtroyed ſome years, and the fortifications of the town much augmented. The Brabanters and the Gueldrians both pretended that this city was in their juriſdiction; and the former ſolicited the duke, their ſovereign, at his inauguration, to take an oath that he would never give up his claims to it; this oath is found in the forty-ninth article of the Joyeuſe Entrée. In 1386, at a congreſs of peace held at Bois-le-Duc, between Philip the Bold duke of Burgundy, and Jane ducheſs of Brabant, on the one part; and William duke of Juliers and Guelders on the other; it was agreed that it ſhould remain to Brabant. The prince of Parma having taken poſſeſſion of it againſt the revolters in 1586, it was beſieged by prince Maurice of Naſſau, the 18th of July 1602; Antoine Gonzales commanded, and the admiral of Aragon made many attempts to ſuccour the place; but not being able to force the prince's camp, he retired; and the place ſurrendered the 19th of September. On the 28th of the ſame month, the prince was proclaimed lord of Cuyck, and the ſigniory was afterwards confirmed to the family of Naſſau by the treaty of Munſter, concluded in 1648. The French made themſelves maſter of it in 1672; but the prince of Orange, afterwards William III. king of England, retook it on the 26th of October 1674, after it had been well defended by the marquis de Chamilli, who had a garriſon of four thouſand men and three hundred and twenty-five pieces of cannon. It was taken by the French republican army in December 1794: twenty miles eaſt of Bois-le-Duc, and thirty-four ſouth-eaſt of Utrecht. Lat. 51. 46. N. lon. 23. 16. E. Ferro.

GRAVE (L.), a town of France, in the department of the Higher Alps, and chief place of a canton, in the diſtrict of Briançon: ſixteen miles north-weſt of Briançon.

GRAVE CREEK, a creek on the Ohio river, about twelve miles down from Wheeling. Here is a mound of earth, obviouſly the work of art, called an Indian grave. It is of a conical form, in height about eighty feet. It aſcends in an angle of about eighty degrees. The diameter at the top is ſixty feet; the margin encloſing a regular concave, ſunk about four feet in the centre. Near the top ſtands an oak, about three feet in diameter. It is ſaid the Indians have no tradition what nation ever buried their dead in this manner. On examination, theſe mounds have been found to contain a calcareous ſubſtance, ſuppoſed to be bones of the human kind.

GRA'VE-CLOTHES, *ſ.* The dreſs of the dead.—And he that was dead came forth, bound hand and foot with *grave-clothes*. *John*, xi. 44.

GRA'VE-DIGGER, *ſ.* One who digs graves.

GRA'VE-MAKER, *ſ.* A grave-digger.—When you are aſked this queſtion next, ſay a *grave-maker*; the houſes that he makes laſt till doomſday. *Shakeſpeare.*

GRAVEDO'NA, or GRAVIDONA, a town of Italy, in the duchy of Milan: forty-two miles north of Milan.

GRAV'EL, *ſ.* [*gravier*, Fr. *graveël*, Dut. *gravel*, Armoric.] Hard ſand; ſand conſiſting of very ſmall pebble ſtones.—*Gravel* conſiſts of flints of all the uſual ſizes and colours, of the ſeveral ſorts of pebbles; ſometimes with a few pyritæ and other mineral bodies, confuſedly intermixed, and common ſand. *Woodward.*

So deep, and yet ſo clear, we might behold
The *gravel* bottom, and that bottom gold. *Dryden.*

[From *gravelle*, Fr.] Sandy matter concreted in the kidneys.—If the ſtone is brittle it will often crumble, and paſs in the form of *gravel*; if the ſtone is too big to paſs, the beſt method is to come to a ſort of compoſition or truce with it. *Arbuthnot.*

To GRAV'EL, *v. a.* To pave or cover with gravel.—Moſs groweth upon alleys, eſpecially ſuch as lie cold and upon the north, as in divers terraſſes; and again, if they be much trodden, or if they were at the firſt *gravelled*. *Bacon.*—To ſtick in the ſand.—William the Conqueror, when he invaded this iſland, chanced at his arrival to be *gravelled*; and one of his feet ſtuck ſo faſt in the ſand that he fell to the ground. *Camden.*—To puzzle; to ſtop; to put to a ſtand; to embarraſs.—What work do our imaginations make with eternity and immenſity! and how are we *gravelled* by their cutting dilemmas! *Glanville.*

Mat, who was here a little *gravell'd*,
Toſt up his noſe, and would have cavill'd. *Prior.*

[In horſemanſhip.] To hurt the foot with gravel confined by the ſhoe.

GRA'VELESS, *adj.* Wanting a tomb; unburied:

My brave Egyptians all,
By the diſcandying of this pelletted ſtorm,
Lie *graveleſs*. *Shakeſpeare.*

GRAVELI'NES, a ſeaport town of France, in the department of the North, and chief place of a canton, in the diſtrict of Bergues, ſituated on the Engliſh Channel, at the mouth of the river Aa, built in the year 1160, by Thierry count of Flanders. It is not large, but well fortified with baſtions, half moons, and horn-work. The country near it is interſected by canals, one of which goes to Dunkirk by Bourbourg, and another directly to Bergues. In 1384 this place was ruined by the Engliſh under the command of Henry Spencer biſhop of Norwich, but was re-eſtabliſhed in 1405, when the ſtates of Flanders intreated John duke of Burgundy to unite it inſeparably to his own dominions. The army of France was defeated the 14th of July 1458, by that of Spain. In 1644 it was taken by the duke of Orleans, uncle to Louis XIV. In 1652 it was retaken by the Spaniards. In 1658 it was attacked by the army of France, and ſurrendered after a ſiege of five days. Since that time it has remained with France, to which it was ceded by the peace of the Pyrenées: three leagues weſt-ſouth-weſt of Dunkirk, and thirteen north-weſt of Liſle. Lat. 50. 59. N. lon. 19. 47. E. Ferro.

GRAV'ELLINESS, *ſ.* [from *gravelly*.] The ſtate or quality of being gravelly. *Scott.*

GRAV'ELLING, *ſ.* The act of covering over with rough ſand; the act of putting any one to a ſtand; the hurt of a horſe's foot by means of gravel under the ſhoe.

GRAV'ELLY, *adj.* [*graveleux*, Fr.] Full of gravel; abounding with gravel; conſiſting of gravel.—If you live in a conſumptive air, make choice of the more open, high, dry, and *gravelly*, part of it. *Harvey.*

GRAVELOT'TE, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Metz: one league and a quarter north of Gorze, and two ſouth-weſt of Metz.

GRA'VELY, *adv.* Solemnly; ſeriouſly; ſoberly; without lightneſs or mirth.—A girl longs to tell her confidant that ſhe hopes to be married in a little time, and aſks her very *gravely* what ſhe would have her to do. *Spectator.*

Wiſdom's above ſuſpecting wiles;
The queen of learning *gravely* ſmiles. *Swift.*

Is't not enough, the blockhead ſcarce can read,
But he muſt wiſely look, and *gravely* plead? *Young.*

Without gaudineſs or ſhow.

GRA'VEN, a town of Norway, in the dioceſe of Bergen: forty-two miles ſouth-ſouth-weſt of Bergen.

GRAVENAU', a town of Germany, in the circle of Lower Bavaria: twenty miles north of Paſſau, and fifty-ſix eaſt-ſouth-eaſt of Ratiſbon. Lat. 48. 46. N. lon. 31. 11. E. Ferro.

GRA'VENESS, *ſ.* Serioufneſs; ſolemnity and ſobriety of behaviour:

Youth no leſs becomes
The light and careleſs livery that it wears,
Than ſettled age his ſables and his weeds,
Importing health and *graveneſs*. *Shakeſpeare.*

GRA'VENHORST, a town of Germany, in the circle of Weſtphalia, and biſhopric of Munſter: four miles north-eaſt of Rheine.

GRA'VENMACHEREN, or GREVENMACHEREN, a town of the duchy of Luxemburg, on the Moſelle, ſituated in a pleaſant and fertile country; near it is an ancient monument, erected by two brothers to the memory of their parents, before the reign of Conſtantine the Great. This town was ſacked and burned in 1552, by the marquis of Brandenburg: five leagues eaſt-north-eaſt of Luxemburg, and four ſouth-weſt of Treves.

GRA'VENWERT, a town of Germany, in the circle of Lower Bavaria: forty-two miles eaſt-north-eaſt of Nuremberg, and fifteen north of Amberg.

GRAVE'OLENCE, *ſ.* [*graveolentia*, Lat.] A rank or ſtinking ſmell.

GRAVE'OLENT, *adj.* [*graveolens*, Lat.] Strong ſcented.

GRA'VER, comp. of *grave*. See GRAVE.

GRA'VER, *ſ.* [*graveur*, Fr.] One whoſe buſineſs is to inſcribe or carve upon hard ſubſtances; one who copies pictures upon wood or metal to be impreſſed on paper. The ſtyle or tool uſed in graving.—See the article ENGRAVING, vol. vi. p. 809.

The toilſome hours in diff'rent labour ſlide,
Some work the file, and ſome the *graver* guide. *Gay.*

GRAV'EROL (Francis), a learned civilian, born at Niſmes in 1635. He was an advocate in the parliament of Toulouſe, and in the preſidial chamber of Niſmes. He was extremely well verſed both in the ſtudies belonging to his profeſſion, and in ſubjects of general literature. His writings conſiſt of ſeveral diſſertations on particular medals, and other monuments of antiquity: of, Obſervations on the Arrets of the Parliament of Toulouſe, 4to. much eſteemed: the collection entitled *Sorberiana*: and *Notice ou Abrégé Hiſtoire des 22 Villes Chefs des Dioceſes de la Prov. de Languedoc*, folio; a poſthumous work. He was well known to all the learned in Europe, and was admitted a member of the Ricovrati at Padua. His adherence to the Calviniſt perſuaſion impeded his advancement, and at length involved him in perſecution. He had retired to Orange in 1685, but not thinking himſelf ſafe there, he attempted to paſs into Switzerland. In his way, he was apprehended at Valence, and was committed to priſon in the citadel of Montpellier. He obtained his liberation, and died at Niſmes in 1694, while employed in ſome important literary works.

GRAVES, [of *graave*, Germ. a governor.] A ſurname.

GRAVESAN'DE, a town of Holland, ſituated about four miles from the ſea, where the ancient counts of Holland generally reſided: ſix miles weſt-ſouth-weſt of Delft.

GRAVESAN'DE (William-James le), a celebrated Dutch mathematician, born at Bois-le-Duc, in 1688. He was ſent to the univerſity of Leyden to ſtudy the civil law; but he made the mathematics his favourite purſuit. Soon after he was eighteen years of age he compoſed his excellent Eſſay on Perſpective. In 1707, after having taken his doctor's degree, he quitted the univerſity and ſettled at the Hague, where he practiſed at the bar, and cultivated an acquaintance with learned men. He was one of thoſe who undertook the publication of a periodical Review, entitled *Le Journal Littéraire*, which commenced in 1713, and was continued without interruption to the year 1722. The parts contributed by Graveſande were extracts and original diſſertations, chiefly relating to geometry and phyſics. When, in 1715, the States-general ſent to congratulate George I. on his acceſſion to the throne of Great Britain, Graveſande was appointed ſecretary to the embaſſy; and during his ſtay in England became intimately acquainted with ſir Iſaac Newton, and was admitted a member of the Royal Society. Upon his return to Holland, he was made profeſſor of mathematics and aſtronomy in the univerſity of Leyden. Upon this he commenced an entire new courſe of phyſics, in which he had the honour of firſt teaching the Newtonian philoſophy in that univerſity. His laborious exertions in theſe departments, and in preparing for publication his own mathematical and philoſophical productions, as well as in ſuperintending correct editions of the works of others, proved too powerful for his conſtitution, which ſunk under them in 1742, when he was fifty-four years of age. His principal publications were, 1. *Phyſices Elementa Mathematica, Experimentis confirmata, ſive Introductio ad Philoſophiam Newtonianam*, 1720; which conſiſts of the author's public lectures, and has gone through many editions, of which the moſt valuable is that publiſhed in Engliſh by Dr. Deſagulier, in 1747, in 2 vols. 4to. under the title of, Mathematical Elements of Natural Philoſophy, confirmed by Experiments. 2. *Matheſeos Univerſalis Elementa*, &c. 1727, 8vo. containing a ſyſtem of algebra for the uſe of ſtudents, with a commentary on Newton's univerſal arithmetic, and a new rule for determining the form of an aſſumed infinite ſeries. 3. *Philoſophiæ Newtonianæ Inſtitutiones*, &c. 1744, 8vo. which is an abridgment of his Elements of Phyſics. 4. *Introductio ad Philoſophiam, Metaphyſicam & Logicam continens.* The whole of his mathematical and philoſophical works were collected and publiſhed at Amſterdam, in 2 vols. 4to. with a critical account of his life and writings, by his diſciple profeſſor Allamand.

GRAVESEND', a handſome town in the county of Kent, ſituated on the ſouth ſide of the mouth of the Thames, and is the firſt port on that river. In the time of Richard II. the original town was taken and burnt by the French and Spaniards; on which account perhaps, as a compenſation, the inhabitants, with thoſe of Milton, obtained the excluſive privilege of conveying paſſengers from thence to London, on condition that they ſhould provide boats on purpoſe, and carry all perſons, either at two-pence per head, with his bundle, or the whole boat's fare ſhould be four ſhillings. This charter has been confirmed by ſucceeding princes, and under proper regulations they ſtill enjoy this advantageous privilege. The fare is now advanced to ninepence each paſſenger. The boats are large and commodious, and much improved within a few years paſt: they are obliged to depart on the ringing of a bell a quarter of an hour; they go to London with every flood,

flood, and return from Billingſgate on the like ſignal with every ebb.

To preſerve the town from future depredation, Henry VIII. raiſed a platform of guns to the eaſt of the town, and erected a fort directly oppoſite, at Tilbury, on the Eſſex ſhore, which is a regular fortification, has a battery commanding the river mounted with above one hundred pieces of cannon, carrying balls from twenty-four to forty-ſix pounds weight. Queen Elizabeth made a law, that the lord-mayor of London, the aldermen, and all the companies, ſhould go and receive all eminent ſtrangers and ambaſſadors at Graveſend, in their formalities, and attend them to London in their ſtate barges, if they went by water; if they went by land, they were to meet them on horſeback in their gowns on Blackheath. In 1727, the church and great part of the town was conſumed by fire. Graveſend is a corporation town, and, together with Milton, governed by a mayor, jurats, and common-council men. The town-houſe, where all public buſineſs is tranſacted, was built in 1764; and is a handſome ſtructure. Here are two markets weekly, on Wedneſday and Saturday; and a fiſh-market every Sunday morning. Fairs April 23, October 24 and 25.

All outward-bound ſhips are obliged to caſt anchor before the port of Graveſend, till they have been examined by, and obtained proper clearances from, ſearchers, appointed for that purpoſe, who have an office near the town-quay: a centinel is alſo ſtationed at the block-houſe, below the town, to give notice by the firing of a muſket when ſhips are coming up the river, who are obliged to receive on-board officers from the cuſtoms, a number of whom are conſtantly waiting for that purpoſe. The preſent elegant church, dedicated to St. George, was erected under an act of parliament paſſed in 1731, at the public expence, being conſidered as one of the fifty new churches, for the building of which the legiſlature had made a proviſion in the reign of queen Anne. In the town are a ſet of alms-houſes, the gift of Mr. Henry Penock, in 1624, to the poor of the corporation; being twenty-one dwelling-houſes, and a houſe for a weaver to employ the ſaid poor. There is a ſufficient eſtate to repair and maintain the ſame; and alſo the ground on which a charity-ſchool is built. The gardens round this town are ſo rich, that they not only ſupply the ſhipping with every article of that kind, but ſend great quantities to London; the aſparagus in particular is remarkably fine: nine miles weſt-north-weſt of Rocheſter, and twenty-two and a half eaſt of London. Lat. 51. 23. N.

GRAVESEND', a port ſituated on the ſouth-weſtern ſide of the iſland of Jamaica, in a large bay. It has two channels, the Leeward and the Main Channel; and affords good anchorage for large veſſels.

GRAVESEND', a townſhip of the American States, in King's county, Long Iſland, New York, ſeven miles north by eaſt of that city.

GRA'VESON, a town of France, in the department of the mouths of the Rhône, and chief place of a canton, in the diſtrict of Taraſcon: five miles north-eaſt of Taraſcon.

GRA'VEST, ſuperl. of *grave*. See GRAVE.

GRA'VESTONE, *ſ.* The ſtone that is laid over the grave; the monumental ſtone:

Timon, preſently prepare thy grave;
Lye where the white foam of the ſea may beat
Thy *graveſtone* daily. *Shakeſpeare.*

GRAV'ID, *adj.* [*gravidus*, Lat. heavy, full.] Pregnant; impregnated.

GRAVID'ITY, *ſ.* Pregnancy; ſtate of being with child.—Women, obſtructed, have not always the forementioned ſymptoms: in thoſe the ſigns of *gravidity* and obſtructions are hard to be diſtinguiſhed in the beginning. *Arbuthnot.*

2

GRAVIM'ETER, *ſ.* the name given by M. Guyton to an inſtrument of glaſs, conſtructed for the purpoſe of determining the ſpecific gravity of bodies, upon a principle very ſimilar to the HYDROMETER; which ſee.

GRAVI'NA, a town of Italy, in the kingdom of Naples, and province of Bari; the ſee of a biſhop, ſuffragan of Acerenza: nine miles weſt of Matera.

GRAVI'NA (Domenicoda), a writer of hiſtory in the fourteenth century, born at Gravina, in the kingdom of Naples. He was a notary by profeſſion, but was much engaged in the civil wars which agitated his country at that period. He wrote in Latin a Hiſtory of Naples, and alſo a Hiſtory of the tranſactions in that part of Italy during his own times, from 1333 to 1350. Of this work, which is valuable for the apparent fidelity of the narration, the beginning and the end are loſt. The remainder was printed by Muratori, in his collection of Italian hiſtorians.

GRAVI'NA (John-Vincent), an eminent juriſt, born in 1664, at Rogiano in Calabria. He received a very liberal education, compriſing the learned languages, geometry, phyſics, hiſtory, antiquities, and theology. He ſtudied civil and canon law at Naples; and viſiting Rome in 1688, he was domeſticated ſome years with Paul Coardo of Turin. He was one of the original founders of the academy of Arcadi, and had the charge of drawing up their laws in the ſtyle of the Roman tables. In 1698 he was nominated profeſſor of civil law at the college of Sapienza; five years afterwards he ſucceeded to the chair of canon law, and to the expoſition of the decretal. His method of teaching was conformable to that he had purſued in ſtudying the ſcience. Avoiding trifling verbal diſputes and ſcholaſtic ſpeculations, he entered into the ſpirit of the laws, illuſtrating their theory by obſervations drawn from ancient writers, and by a criticiſm founded on his extenſive erudition. In the mean time he was ſpreading his reputation by his writings, which were many, and various in their ſubject. His great profeſſional work, entitled *Origines Juris Civilis*, firſt printed at Leipſic in 1708, afterwards more correctly at Naples, 1713, is reckoned a claſſical performance, lucid in its arrangement, and replete with ſolid learning. His Inſtitutes of Civil and Canon Law were printed againſt his will, as he had deſigned to give them in a more correct and augmented form. Gravina likewiſe undertook to eſtabliſh a poetical code, for which purpoſe he wrote two books, *Della Region Poetica*; a book, *Della Tragedia*; and a treatiſe, *De Inſtitutione Poetarum*. He was more ſucceſsful as a legiſlator than as a practiſer in this art; for his five tragedies, written upon the model of the ancients, were not favourably received by the public; and the author's angry expoſtulation, proving that they *ought* to have been applauded, was totally inefficacious. Gravina reviſited his native country in 1714, but two years afterwards returned to Rome. He was preparing to depart for Turin, whither the duke of Savoy had invited him not only to the chair of law, but to the general direction of learned inſtitutions, when he was ſeized with an illneſs which, in January 1718, carried him off, in the arms of his ſcholar Metaſtaſio, whoſe poetical talents he firſt cheriſhed, and whom he left heir of all his property out of Calabria. All the works of this learned writer have been publiſhed at Naples, in 3 vols. 4to. 1756.

GRA'VING, *ſ.* Carved work.—Skilful to work in gold; alſo to grave any manner of *graving*, and to find out every device which ſhall be put to him. 2 *Chro.* ii. 14.

GRA'VISCÆ, now *Eremo de St. Auguſtino*, a maritime town of Etruria, which aſſiſted Æneas againſt Turnus. The air was unwholeſome, on account of the marſhes and ſtagnant waters in its neighbourhood. *Virgil.*

GRAVIS'ONOUS, *adj.* [of *gravis* and *ſonus*, Lat.] Sounding with a grave air.

To GRAV'ITATE, *v. n.* [from *gravis*, Lat.] To tend to the centre of attraction:

Thoſe

Thoſe who have nature's ſteps with care purſu'd,
That matter is with active force endu'd,
That all its parts magnetic pow'r exert,
And to each other *gravitate*, aſſert. *Blackmore.*

GRAVITA'TION, *ſ.* Act of tending to the centre. —The moſt conſiderable phenomenon belonging to the terreſtrial bodies is the general action of *gravitation*, whereby all known bodies, in the vicinity of the earth, do tend and preſs towards its centre. *Bentley.*

When the looſe mountain trembles from on high,
Shall *gravitation* ceaſe, if you go by? *Pope.*

It is one of the laws of nature, diſcovered by Newton, and now received by all philoſophers, that every particle of matter in nature gravitates towards every other particle; which law is the main principle in the Newtonian philoſophy. But what is called *gravitation* with reſpect to the gravitating body, is uſually called *attraction* with reſpect to the body gravitated to. The planets, both primary and ſecondary, as alſo the comets, do all gravitate towards the ſun, and towards each other; as well as the ſun towards them; and that in proportion to the quantity of matter in each of them. The peripatetics indeed hold, that bodies only gravitate or *weigh*, when out of their natural places, and that gravitation ceaſes when they are reſtored to the ſame, the purpoſe of nature being then fulfilled; and they maintain that the final cauſe of this faculty is only to bring elementary bodies to their proper place, where they may reſt. But the moderns ſhew that bodies exerciſe gravity even when at reſt, and in their proper places. This is particularly ſhewn of fluids; and it is one of the laws of hydroſtatics, that fluids gravitate in proprio loco, the upper parts preſſing on the lower, &c. See the article MECHANICS.

GRAV'ITY, *ſ.* [*gravitas*, Lat. *gravité*, Fr.] Weight; heavineſs; tendency to the centre.—Bodies do ſwim or ſink in different liquors, according to the tenacity or *gravity* of thoſe liquors which are to ſupport them. *Brown.*—Atrociouſneſs; weight of guilt.—No man could ever have thought this reaſonable, that had intended thereby only to puniſh the injury committed, according to the *gravity* of the fact. *Hooker.*—Serioufneſs; ſolemnity.—For the advocates and council that plead, patience and *gravity* of hearing is an eſſential part of juſtice. *Bacon.*

In phyſics, the terms *gravity*, *weight*, *centripetal force*, and *attraction*, denote in effect much the ſame thing, only in different views and relations; all which however it is too common to confound and uſe promiſcuouſly. But, correctly, when a body is conſidered as in the act of tending towards the earth, the force with which it ſo tends is called *force of gravity*, or *gravitating force*: for which ſee MECHANICS. When the body is conſidered as immediately tending to the centre of the earth, it is called *centripetal force*: ſee the article FLUXIONS, vol. vi. p. 516. When we conſider the earth, or maſs, or matter, to which the body tends, it is called *attraction*, or *attractive force*: ſee CHEMISTRY, vol. iv. p. 174. When it is conſidered in reſpect of an obſtacle or another body in the way of the tendency upon which it acts, it is called *weight*: ſee MECHANICS.

Philoſophers have argued very differently on the ſubject of gravity. Newton, though he often calls it a *vis*, power, or property in bodies, yet explains himſelf, that he means nothing more by the word but the effect or phenomenon: he does not conſider the principle the cauſe by which bodies tend downwards, *but the tendency itſelf*, which is no occult quality, but a ſenſible phenomenon, be its cauſes whatever they may; the laws or properties relating to which are as follow:

All bodies which circumſcribe, ſurround, or exiſt upon or above, the earth, tend towards a point, which is either accurately or very nearly the centre of magnitude of the terraqueous globe. Hence, in all places equidiſtant from the centre of the earth, as ſuppoſe in the degrees or minutes of a circle ſurrounding the whole, if perpendiculars or weights were let fall, they would all meet and coaleſce in the centre of the earth. It muſt however be recollected, that all the parts of the earth's ſurface are not at equal diſtances from the centre, becauſe the equatorial parts are higher than the polar parts by about ſeventeen miles; as has been ſhewn under the article ASTRONOMY.

Gravity equally affects all bodies, without regard either to their bulk, figure, or matter: ſo that, abſtracting from the reſiſtance of the medium, the moſt compact and looſe, the greateſt and ſmalleſt, bodies, would all deſcend through an equal ſpace in the ſame time; whence the force of gravity is nearly equal, as appears from the quick deſcent of very light bodies in an exhauſted receiver. The ſpace which bodies do actually fall, in vacuo, is $16\frac{1}{12}$ feet in the firſt ſecond of time, in the latitude of London; and for other times, either greater or leſs than that, the ſpaces deſcended from are directly proportional to the ſquares of the times, while the falling body is not far from the earth's ſurface. This power is the greateſt at the earth's ſurface, from whence it decreaſes both upwards and downwards, but not both ways in the ſame proportion; for upwards the force of gravity is leſs, or decreaſes, as the ſquare of the diſtance from the centre increaſes; ſo that at a double diſtance from the centre, above the ſurface, the force would be only one-fourth of what it is at the ſurface; but below the ſurface, the power decreaſes in ſuch ſort that its intenſity is in the direct ratio of the diſtance from the centre; ſo that at the diſtance of half a ſemidiameter from the centre, the force would be but half what it is at the ſurface; at one-third of a ſemidiameter the force would be one-third, and ſo on.

As all bodies gravitate towards the earth, ſo does the earth equally gravitate towards all bodies; as well as all bodies towards particular parts of the earth, as hills, &c. which has been proved by the attraction a hill has upon a plumb line, inſenſibly drawing it aſide. Hence the gravitating force of entire bodies conſiſts of thoſe of all their parts: for by adding or taking away any part of the matter of a body, its gravity is increaſed or decreaſed in the proportion of the quantity of ſuch portion to the whole maſs. Hence alſo the gravitating powers of bodies, at the ſame diſtance from the centre, are proportional to the quantities of matter in the bodies. But for the doctrine of the *Centre of Gravity*, and *Central Forces*, ſee the articles FLUXIONS, and MECHANICS.

The exiſtence of the ſame principle of gravity in the ſuperior regions of the heavens, as on the earth, is one of the great diſcoveries of Newton. At firſt he only obſerved that all bodies near the earth, and in its atmoſphere, had the property of tending directly towards it; but at length he ſaw no reaſon why it might not extend as far as to the moon, by means of which ſhe might be retained in her orbit as a ſtone in a ſling is retained by the hand; and if ſo, he next inferred, why might not a ſimilar principle exiſt in the other great bodies in the univerſe, the ſun and all the other planets, both primary and ſecondary, which might all be retained in their orbits, and perform their revolutions, by means of the ſame univerſal principle of gravity. Theſe conjectures he ſoon realized and verified by mathematical proofs. Kepler had found out, by contemplating the motions of the planets about the ſun, that the area deſcribed by a line connecting the ſun and planet, as this revolved in its orbit, was always proportional to the time of its deſcription, or that it deſcribed equal areas in equal times, in whatever part of its orbit the planet might be, moving always ſo much the quicker as its diſtance from the ſun was leſs. And it is alſo found that the ſatellites, or ſecondary planets, reſpect the ſame law in revolving about their primaries. It was next proved by Newton, that all bodies moving in any curve line

line described on a plane, and which, by radii drawn to any certain point, describe areas about the point proportional to the times, are impelled or acted on by some power tending towards that point. Consequently the power by which all these planets revolve, and are retained in their orbits, is directed to the centre about which they move, viz. the primary planets to the sun, and the satellites to their several primaries.—See the article ASTRONOMY, vol. ii. p. 341.

Various theories have been advanced by philosophers of different ages, to account for the principles of gravity. The ancients, who were only acquainted with the tendency of sublunar bodies towards the earth, aimed no farther than a system that might answer the more obvious phenomena of it. Yet some hints are found concerning the gravitation of celestial bodies in the account given of the doctrine of Thales and his successors; and it is supposed that Pythagoras had a view to it in what he taught concerning the harmony of the spheres. Kepler, in his preface to the commentaries concerning the planet Mars, speaks of it as of a power that was mutual between bodies; and says that the earth and moon tend towards each other, and would meet in a point so many times nearer to the earth than to the moon, as the earth is greater than the moon, if their motions did not hinder it. He adds, that the tides arise from the gravity of the waters towards the moon. To him we also owe the important discovery of the analogy between the distances of the several planets from the sun, and the periods in which they complete their revolutions, viz. that the squares of their periodic times are always in the same proportion as the cubes of their mean distances from the sun. However, Kepler, Gassendi, Gilbert, and others, ascribe gravity to a certain magnetic attraction of the earth; conceiving the earth to be one great magnet continually emitting effluvia, which take hold of all bodies, and draw them towards the earth. But this is inconsistent with the several phenomena.

Dr. Clarke, from a view of the several properties of gravity, concludes that it is no adventitious effect of any motion, or subtle matter, but an original and general law impressed by the Creator on all matter, and preserved in it by some efficient power penetrating the very solid and intimate substance of it; being found always proportional, not to the surfaces of bodies or corpuscles, but to their solid quantity and content. It should therefore be no more inquired why bodies gravitate, than how they came to be first put in motion. See Annot. in Rohault. Phys. part. i. cap. 11.

Of SPECIFIC GRAVITY.

SPECIFIC gravity is the relative, comparative, or apparent, gravity in any body, in respect of that of an equal bulk or magnitude of another body; denoting that gravity or weight which is peculiar to each species or kind of body, and by which it is distinguished from all other kinds. The specific gravity of solids is determined by weighing them first in the air, and then in water. A body is said to be specifically heavier than another, when under the same bulk it contains a greater weight than that other; and reciprocally the latter is said to be specifically lighter than the former. If there be two equal spheres, each one foot in diameter, the one of lead, and the other of wood, since the leaden one is found heavier than the wooden one, it is said to be specifically, or in specie, *heavier*; and the wooden one specifically *lighter*. The laws by which the specific gravities of bodies appear to be governed, are as follow:

1. If two bodies be equal in bulk, their specific gravities are to each other as their weights, or as their densities. 2. If two bodies be of the same specific gravity or density, their absolute weights will be as their magnitudes or bulks. 3. In bodies of the same weight, the specific gravities are reciprocally as their bulks. 4. The specific gravities of all bodies are in a ratio compounded in the direct ratio of their weights and the reciprocal ratio of their magnitudes. And hence again the specific gravities are as the densities. 5. The absolute gravities or weights of bodies are in the compound ratio of their specific gravities and magnitudes or bulks. 6. The magnitudes of bodies are directly as their weights, and reciprocally as their specific gravities. 7. A body specifically heavier than a fluid, loses as much of its weight when immersed in it, as is equal to the weight of a quantity of the fluid of the same bulk or magnitude. Hence, since the specific gravities are as the absolute gravities under the same bulk; the specific gravity of the fluid, will be to that of the body immerged, as the part of the weight lost by the solid is to the whole weight: and hence the specific gravities of fluids are as the weights lost by the same solid immerged in them. 8. The specific gravities of bodies of equal weight, are reciprocally proportional to the quantities of weight lost in the same fluid. And hence is found the ratio of the specific gravities of solids, by weighing in the same fluids, masses of them that weigh equally in air, and noting the weights lost by each.—See the article MECHANICS.

Much advantage has been, and may still be, derived from a careful investigation of these laws, and their application; since it is very probable, that by an attention to the specific gravities, capacities for heat, fusibilities, volatilities, laws of crystallization, elasticity, hardness, tenacity, malleability, and other obvious specific properties of bodies, we may yet discover a more intimate acquaintance with the mutual actions of their particles, than any that has hitherto been acquired.

From the foregoing data it is easy to construct a general table of specific gravities, by reducing the proportion of the absolute weight to the loss sustained by immersion, into terms of which that expressing water shall be unity. If the solid be so light as to float upon water, it is convenient to attach to it another heavier body sufficient to cause it to sink, but whose weight in water must be added in computing the loss. And since the loss by immersion will accurately shew the weight of the same bulk of the fluid; so, consequently, the proportion of these several quantities to the loss the same solid sustained in water, being reduced as in the other case to the common standard of unity, will exhibit the specific gravity. Other methods are likewise used in experiments with fluids. Thus equal bulks of different fluids may be weighed by filling a small bottle with a ground stopper with each respectively, and from their several weights the weight of the bottle and stopper must be deducted. Or otherwise, the instrument called the hydrometer may be used, which possesses the advantage of portability, speed, and a degree of accuracy not easily obtained by the use of ordinary balances. —See the article HYDROMETER.

The following arrangement will shew the specific gravity of metals and other bodies to rain water, and the weight of a cubic inch of each, in parts of a pound averdupoise.

GRAUL'HET, a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Lavaur: three leagues north-eaſt of Lavaur, and five north-weſt of Caſtres.

GRAUNT (John), famous for introducing the ſcience of political arithmetic, born in London in 1620. The bills of mortality of the city of London afforded him a ſubject of ſpeculation, from which he was convinced that ſeveral inferences might be drawn of moral and political importance. He employed much induſtry in collecting the proper materials, from which he compoſed a work entitled Natural and Political Obſervations made upon the Bills of Mortality, &c. Lond. 1661, 4to. This was ſo well received that it paſſed through five editions in fifteen years, and it obtained for the author admiſſion into the Royal Society, upon the particular recommendation of the king. It is probable that his friend ſir William Petty, ſo well known for his calculations, aſſiſted him in this work. He continued to make additions to his obſervations, as well as to purſue his ſtudies on other topics, till his death in 1674.

GRAUSZYSZ'KI, a town of Poland, in the palatinate of Wilna: twenty-eight miles ſouth-eaſt of Wilna.

GRA'VY, *ſ.* The ſerous juice that runs from fleſh not much dried by the fire.—Meat we love half raw, with the blood trickling down from it, delicately terming it the *gravy*, which in truth looks more like an ichorous or raw bloody matter. *Harvey.*

GRAY, *adj.* [ȝɲæȝ, Sax. *grau*, Dan. *graau*, Dutch.] White with a mixture of black.—Theſe *gray* and dun colours may be produced by mixing whites and blacks. *Newton.*

They left me then, when the *gray*-headed even,
Like a ſad votariſt in palmer's weed,
Roſe from the hindmoſt wheels of Phœbus' wain. *Milton.*

White or hoary with old age.—Living creatures generally do change their hair with age, turning to be *gray*; as is ſeen in men, though ſome earlier and ſome later; in horſes, that are dappled and turned white; in old ſquirrels that turn griſly, and many others. *Bacon.*

Gray-headed men and grave, with warriors mix'd,
Aſſemble. *Milton.*

Dark, like the opening or cloſe of day; of the colour of aſhes.—Our women's names are more gracious than their Cæcilia, that is, *gray* eyed. *Camden.*

The *gray*-ey'd morn ſmiles on the frowning night,
Cheq'ring the eaſtern clouds with ſtreaks of light. *Shak.*

GRAY, *ſ.* A gray colour:

Down ſunk the ſun, the cloſing hour of day
Came onward, mantled o'er with duſky *gray*. *Parnel.*

GRAY, *ſ.* A badger. *Ainſworth.*

GRAY, a town of France, and principal place of a diſtrict, in the department of the Upper Saône, on the Saône, navigable for boats to Lyons, whither the inhabitants ſend grain and iron, which form the chief articles of commerce. The fortifications have been deſtroyed: ſeven poſts ſouth-ſouth-eaſt of Langres, and forty-one ſouth-ſouth-eaſt of Paris. Lat. 47. 27. N. lon. 23. 15. E. Ferro.

GRAY, a poſt town of the American States, in the diſtrict of Maine, in Cumberland county, fifteen miles north by weſt of Portland, incorporated in 1778.

GRAY (Jane). See GREY.

GRAY (Thomas), an admired Engliſh poet, born in London in 1716. He was ſent by his parents to lay in the fundamental ſtock of claſſical literature at Eton ſchool. In 1734 he removed to the univerſity of Cambridge, and entered as a penſioner in St. Peter's college. He firſt appeared as a poet among the univerſity-congratulators of the marriage of the prince of Wales, and his verſes were eſteemed the beſt of the academical collection. He quitted college in 1738, and occupied a

ſet

ſet of chambers in the Inner Temple, for the purpoſe of ſtudying the law; when he gladly embraced an invitation to accompany Mr. Walpole in the tour of Europe. They ſet out together in the enſuing ſpring; and travelled through France, croſſed the Alps, viſited the principal towns of Italy as far as Naples, returned to Florence, and in the ſpring of 1741 proceeded to Venice. Upon the way thither the two companions fell into a diſagreement, which occaſioned their ſeparation. Of this unfortunate incident Mr. Walpole has generouſly taken all the blame to himſelf. Gray, with his own moderate reſources, finiſhed the reſt of his tour, and arrived in England in September 1741. His reſidence from this time was chiefly at Cambridge, to which he was probably attached by an inſatiable love of books, which his fortune would not permit him to indulge from his own ſtores. It was not till 1747 that his Ode on a diſtant Proſpect of Eton College made its appearance before the public. What degree of popularity it obtained we are not told; but the love of fame could not be very active in his mind, ſince it was only in conſequence of the printing of a ſurreptitious copy that he publiſhed, in 1751, his celebrated Elegy written in a Country Church-yard, chiefly compoſed ſome years before, and even now ſent into the world without the author's name. Few poems were ever ſo popular: it ſoon ran through eleven editions, was tranſlated into Latin verſe, and has ever ſince borne all the marks of being one of the moſt favourite productions of the Britiſh muſe. The death of Cibber, in 1757, gave occaſion to a deſign of retrieving the character of the laureate from the contempt it had undergone, by conferring the office upon ſome real poet, and it was offered to Gray. He declined the appointment, which was accepted by Whitehead. What he was capable of doing as a lyric poet was ſhewn in the ſame year by the publication of his two principal odes, On the Progreſs of Poeſy, and The Bard. As theſe were expreſsly meant to be "vocal to the intelligent alone," it is not ſurpriſing that they were leſs popular than his elegy had been. Many could not underſtand them; ſome ridiculed them; and in general they were more gazed at than taſted: but with particular readers they raiſed the author's poetical talent to a level with that of the firſt poets of his country. The uniformity of his life was varied by a reſidence of three years, commencing in 1759, in lodgings near the Britiſh Muſeum, chiefly for the purpoſe of conſulting curious books and manuſcripts in that great national repoſitory. A journey into Scotland for his health, in 1765, introduced him to the moſt eminent literati in that country, and fed his imagination with thoſe ſcenes of natural ſublimity and beauty which no man was better qualified to taſte. The profeſſorſhip of modern hiſtory at Cambridge, a place worth four hundred pounds per annum, which had fallen vacant in 1762, was modeſtly aſked by him of lord Bute, but had before been promiſed to another. On a ſecond vacancy, in 1768, it was conferred upon him "unſolicited and unexpected," in the moſt handſome manner, by the duke of Grafton. He made a voluntary return for the favour, by an Ode for Muſic, for the inſtallation of that nobleman as chancellor of the univerſity, in 1769. His new profeſſorſhip, while it made an important addition to his income and his academical dignity, laid him under an obligation to exertion, which cauſed him conſiderable anxiety. Though founded in 1724, it had hitherto remained a perfect ſinecure. The example of his predeceſſors, however, did not ſatisfy him, and he prepared himſelf to execute the duties of the office. The baneful effects of habitual indolence, and a life paſſed without any determinate objects, were in his caſe ſingularly conſpicuous; for, with a mind replete with the ſtores of knowledge ancient and modern, he was unable to bring his acquiſitions to uſe on demand; and, after many uneaſy ſtruggles, he proceeded no further than to ſketch out a plan for his inauguration ſpeech. But his health was now declining; low ſpirits, the indolent ſcholar's familiar malady, ſeized upon him; and he died July 30, 1771, in the fifty-fifth year of his age. It is excluſively as a poet that the name of Gray deſerves to be tranſmitted to poſterity. In this capacity, the ſmall number of his compoſitions, compared with the high rank he has attained, muſt be conſidered as indicative of an uncommon degree of excellence. In pure invention, perhaps, Gray cannot be ſaid to excel, neither is he highly pathetic or ſublime; but he is ſplendid, lofty, and energetic; generally correct, and richly harmonious. Though lyric poetry is that in which he has chiefly exerciſed himſelf, he was capable of varying his manner to ſuit any ſpecies of compoſition. Perhaps he was beſt of all qualified for the moral and didactic, if we may judge from his noble fragment of An Eſſay on the Alliance of Education and Government. But the number of his fragments indicates a want of energy to ſupport a long-continued flight; and it would be too indulgent to ſuppoſe that he could have performed all that he planned. As a writer of Latin verſe he is perhaps ſurpaſſed by few in claſſic propriety, and certainly excels the ordinary tribe of Latin verſifiers in novelty and dignity. The familiar letters of Gray are entertaining and inſtructive. They are free from all parade, and poſſeſs a fund of pleaſantry, ſometimes bordering upon quaintneſs.

GRAY'BEARD, *ſ.* An old man: in contempt:

Youngling, thou can'ſt not love ſo dear as I.
Graybeard, thy love doth freeze. *Shakeſpeare.*

GRAY'LING, *ſ.* In ichthyology, the umber. See the article SALMO.

GRAY'NESS, *ſ.* The quality of being gray.

GRAY'-EYED, *adj.* Having gray eyes.—The *gray-ey'd* morn ſmiles on the frowning night. *Shakeſpeare.*

GRAY-HAIRED, *adj.* Having gray hairs:

In *gray-hair'd* Cælia's wither'd arms
As mighty Louis lay,
She cry'd, If I have any charms,
My deareſt, let's away. *Dorſet.*

GRAY'-HEADED, *adj.* With a gray head of hair:

Gray-headed men and grave, with warriors mix'd,
Aſſemble. *Milton.*

GRAYS, or GRAYS-THURROCK, a ſmall neat town in the county of Eſſex, diſtant twenty five miles from London, beautifully ſituated on the banks of the Thames, oppoſite Dartford in Kent. Its trade is inconſiderable. It has a fair yearly on the 23d of May, for pedlary; and a market on Thurſdays, at which a conſiderable quantity of grain is ſold to the London factors. A veſſel for goods and paſſengers ſails every Sunday and Thurſday to Wheelers wharf, St. Catharine's, London; and returns on Mondays and Thurſdays: fare nine-pence. The town ſtands on the ſide of a hill; and has a good market-place, and market-houſe, over which is a handſome ſeſſions-room. Here is alſo a large wharf, whoſe ſituation on the river is about half way between Purfleet-magazines and Tilbury-fort.

GRAZALE'MA, a town of Spain, in the province of Grenada: eight miles weſt of Ronda.

GRAZAY-LE-BOI'S, a town of France, in the department of the Mayenne, and chief place of a canton, in the diſtrict of Mayenne: one league and three quarters eaſt of Mayenne, and two and three quarters north of Evron.

To GRAZE, *v. n.* [from *graſs.*] To eat graſs; to feed on graſs.—The greateſt of my pride is to ſee my ewes *graze*, and my lambs ſuck. *Shakeſpeare.*

The more ignoble throng
Attend their ſtately ſteps, and ſlowly *graze* along. *Dryd.*

To

To ſupply graſs.—A third ſort of *grazing* ground is that near the ſea, which is commonly very rich land. *Mortimer.*—To move on devouring.—As every ſtate lay next to the other that was oppreſſed, ſo the fire perpetually *grazed. Bacon.*

[From *raſer*, Fr.] To touch lightly:

Mark then a bounding valour in our Engliſh,
That being dead, like to the bullets *grazing*,
Breaks out into a ſecond courſe of miſchief,
Killing in relapſe of mortality. *Shakeſpeare.*

To GRAZE, *v. a.* To tend grazing cattle; to ſet cattle, to feed on graſs.—Jacob *graz'd* his uncle Laban's ſheep. *Shakeſpeare.*

O happy man, ſaith he, that, lo! I ſee
Grazing his cattle in thoſe pleaſant fields. *Daniel.*

To feed upon.—Some *graze* their land 'till Chriſtmas, and ſome longer. *Mortimer.*

I was at firſt as other beaſts, that *graze*
The trodden herb, of abject thoughts and low. *Milton.*

To ſupply with graſs.—He hath a houſe and a barn in repair, and a field or two to *graze* his cows. *Swift.*

GRAZIA'NI (Anton-Maria), a learned and elegant writer, born of a diſtinguiſhed family at Borgo-ſan-Sepolcro, in Tuſcany, in 1537. After he had acquired the knowledge of Latin under Abſtemio, a celebrated maſter at Friuli, he was ſent to Padua to ſtudy the law. In 1560 he viſited Rome, where he was received into the houſe of cardinal Commendone, who treated him with a kindneſs which laid the foundation of an unalterable attachment. He accompanied this patron in all his journeys into Germany and Poland; and refuſed to quit him, though ſolicited with great promiſes by Henry of Valois, at that time king of the latter country. After the death of Commendone in 1584, he was made ſecretary to pope Sixtus V. He had a conſiderable ſhare in the election of Clement VIII. who, in 1592, created him biſhop of Amelia, and ſent him as his nuncio to the Italian princes and ſtates, in order to unite them in a league againſt the Turks. After the cloſe of his nunciature in 1598, he retired to his ſee, where he aſſiduouſly employed himſelf in the duties of his function till his death in 1611. His writings are, 1. *De Bello Cyprio, Lib. V.* 4to. *Rome*, 1624. A Hiſtory of the War of Cyprus, in elegant Latin. 2. *De Vita Joannis Franciſci, Commendoni, Cardinalis*, 4to. *Par.* 1669. 3. *De Caſibus Adverſis Virorum illuſtrium*, 4to. *Par.* 1680: and a collection of Synodal Ordinances, 1595, folio. A poſthumous work of his was publiſhed at Florence in 1745, entitled *De Scriptis Invita Minerva, ad Aloyſium Fratrem, Lib. XX.* 4to. in which he not only gives an account of his own life and writings, but of the public affairs in which he was engaged, eſpecially thoſe of Poland. This is eſteemed as a very curious and intereſting performance.

GRA'ZER, *ſ.* One that grazes or feeds on graſs:

His flock daily crops
Their verdant dinner from the moſſy turf
Sufficient: after them the cackling gooſe,
Cloſe *grazer*, finds wherewith to eaſe her want. *Philips.*

GRA'ZIER, *ſ.* One who feeds cattle.—Gentle peace, which filleſt the huſbandman's barns, the *grazier's* folds, and the tradeſman's ſhop. *Howel.*

GRA'ZING, *ſ.* The trade of feeding cattle for ſlaughter; the act of feeding on graſs.

GRAZZI'NI (Antony-Francis, ſurnamed Il Laſca), an Italian writer, born of an ancient family at Florence in 1503, and died in 1583. He wrote a volume of poems, publiſhed at Florence in 1559. His other works are, 1. *La Guerra de Moſtri, Poema giocoſo*, 1584. 2. *Stanze, &c.* 3. *Comedie VII.* 4. *Il Laſca, Dialogolo, &c.* 1583. 5. *Letiere.* 6. *Orazione.* 7. *Rime.* 8. *Novelle XI.* As a noveliſt he was thought to be a rival of Boccace in the elegance of his narration, and purity of his ſtyle. Grazzini was one of the founders of the academy *Della Cruſca.*

GREASE, *ſ.* [*graiſſe*, Fr.] The ſoft part of the fat; the oily or unctuous part of animals.—To take out a ſpot of *greaſe*, they uſe a coal upon brown paper. *Bacon.*

Thou hop'ſt, with ſacrifice of oxen ſlain,
To compaſs wealth, and bribe the god of gain
To give thee flocks and herds, with large encreaſe:
Fool! to expect them from a bullock's *greaſe. Dryden.*

M. Deſchamps, of the Philoſophical Society at Lyons, recommends the following proceſs for removing ſpots of greaſe from paper, printed books, or copper-plate engravings:—After having gently warmed the paper or print ſtained with greaſe, wax, oil, or any fat body whatever, take out as much as poſſible of it, by means of blotting-paper preſſed down by a hot iron. Then dip a ſmall bruſh in the eſſential oil of well-rectified ſpirit of turpentine, heated almoſt to ebullition (for when cold it acts very weakly), and draw it gently over both ſides of the paper or print, which muſt be carefully kept warm. This operation muſt be repeated as many times as the quantity of the fat body imbibed by the paper, or the thickneſs of the paper, may render neceſſary. When the greaſy ſubſtance is entirely removed, recourſe may be had to the following method to reſtore the paper to its former whiteneſs, if not completely reſtored by the firſt proceſs: Dip another bruſh in highly-rectified ſpirit of wine, and draw it in like manner over the place which was ſtained, and particularly round the edges to remove the border that would ſtill preſent a ſtain. By employing theſe means, with proper caution, the ſpot will totally diſappear; the paper or print will reſume its original ſplendour; and if the proceſs has been employed on a part written on with common ink, or printed with printers ink, it will experience no alteration.

To remove Spots of Greaſe from Cloth or Silk.—Greaſy ſubſtances are removed from cloths or ſilks by alkalies, ſoaps, the yolk of eggs, fat earths; oxyds of iron, by the nitric and oxalic acids; acids by alkalies, and reciprocally. But when the ſpots are of a complex kind, it will be neceſſary to employ ſeveral means in ſucceſſion. Thus: to deſtroy the ſtain of coom from carriage-wheels, after the greaſe has been diſſolved, the oxyd of iron muſt be removed by the oxalic acid.—The following may be conſidered as one of the moſt valuable receipts: Diſſolve white ſoap in alcohol, and mix this ſolution with the yolks of from four to five eggs: add gradually eſſence of turpentine; and incorporate with the whole ſome fuller's earth, in ſuch a manner as to form balls of a ſuitable conſiſtence. Moiſten the ſpot; and, having rubbed it with theſe balls, the ſpot will be removed by waſhing the ſtuff. All ſpots, except iron-mould and ink, may be removed in this manner. Waſhing deſtroys the luſtre of the ſtuff, and leaves a tarniſhed place diſagreeable to the eye; but the luſtre may be reſtored by drawing over the waſhed place, and in the direction of the pile, a bruſh moiſtened in water impregnated with a little gum. You may then apply a ſheet of paper, or a piece of cloth, and a conſiderable weight, under which the cloth muſt be left to dry.

GREASE, *ſ.* In farriery, a ſwelling and gourdineſs of the legs, which ſometimes happens to a horſe by ſtanding long in the ſtable.—See the article FARRIERY, vol. vii. p. 252.

To GREASE, *v. a.* To ſmear or anoint with greaſe. To bribe; to corrupt with preſents:

Envy not the ſtore
Of the *greas'd* advocate that grinds the poor. *Dryden.*

GREA'SINESS, *ſ.* Oilineſs; fatneſs.—Upon the moſt of theſe ſtones, after they are cut, there appears always, as it were, a kind of *greaſineſs* or unctuoſity. *Boyle.*

GREA'SY, *adj.* Oily; fat; unctuous:

The fragments, ſcraps, the bits and *greaſy* reliques,
Of her o'ereaten faith. *Shakeſpeare.*

Smeared with greaſe.—Buy ſheep, and ſee that they be big-boned, and have a ſoft, *greaſy*, well curled, cloſe, wool. *Mortimer.*—Fat of body; bulky: in reproach.—Let's conſult together againſt this *greaſy* knight. *Shakeſpeare.*

GREAT, *adj.* [ȝreat, Sax. *groot*, Dut.] Large in bulk or number.—Judas one of the twelve came, and with him a *great* multitude with ſwords and ſtaves. *Mat.* xxvi.

A dungeon horrible, on all ſides round,
As one *great* furnace flam'd. *Milton.*

Having any quality in a high degree.—There were they in *great* fear. *Pſ.* xiv. 5.—*Great* triumph and rejoicing was in heav'n. *Milton.*

Charms ſuch as thine, inimitably *great*
He only could expreſs. *Broome.*

Having number or bulk, relative or comparative.—The idea of ſo much is poſitive and clear: the idea of *greater* is alſo clear, but it is but a comparative idea. *Locke.*—Conſiderable in extent or duration.—Thou haſt ſpoken of thy ſervant's houſe for a *great* while to come. 2 *Sam.* vii. 19.—Important; weighty.—Though this be a *great* truth, if it be impartially conſidered, yet it is alſo a great paradox to men of corrupt minds and vicious practices. *Tillotſon.*

What is low raiſe and ſupport,
That to the height of this *great* argument
I may aſſert eternal Providence,
And vindicate the ways of God to man. *Milton.*

Chief; principal:

Hear the king's pleaſure, cardinal, who commands you
To render up the *great* ſeal. *Shakeſpeare.*

Venerable; adorable; awful:

Thou firſt art wont God's *great* authentic will,
Interpreter, through higheſt heav'n to bring. *Milton.*

Wonderful; marvellous.—*Great* things and full of wonder. *Milton.*—Of high rank; of large power:

Of all the *great*, how few
Are juſt to heav'n, and to their promiſe true! *Pope.*

Misfortune made the throne her ſeat,
And none could be unhappy but the *great*. *Rowe.*

General; extenſive in conſequence or influence:

Prolific humour ſoft'ning all her globe,
Fermented the *great* mother to conceive. *Milton.*

Illuſtrious; eminent; noble; excellent.—O Lord, thou art *great*, and thy name is *great* in might. *Jer.* x. 6.

Great are thy works Jehovah, infinite
Thy pow'r! what thought can meaſure thee, or tongue
Relate thee! *greater* now in thy return,
Than from the giant angels: thee that day
Thy thunders magnified, but to create
Is *greater* than created to deſtroy. *Milton.*

Grand of aſpect; of elevated mien:

Such Dido was; with ſuch becoming ſtate,
Amidſt the crowd, ſhe walks ſerenely *great*. *Dryden.*

Magnanimous; generous; high-minded.—In her every thing was goodly and ſtately; yet ſo, that it might ſeem that *great*-mindedneſs was but the ancient-bearer to the humbleneſs. *Sidney.*—Opulent; ſumptuous; magnificent:

Not Babylon,
Nor *great* Alcairo, ſuch magnificence
Equall'd in all their glories. *Milton.*

Intellectually great; ſublime:

This new-created world, how good, how fair,
Anſwering his *great* idea! *Milton.*

Swelling; proud.—Solyman perceived that Vienna was not to be won with words, nor the defendants to be diſcouraged with *great* looks. *Knolles.*—Familiar; much acquainted. *A low word.*—Thoſe that would not cenſure, or ſpeak ill of a man immediately, will talk more boldly of thoſe that are *great* with them. *Bacon.*—Pregnant; teeming:

Their bellies *great*
With ſwelling vanity, bring forth deceit. *Sandys.*

This fly, for moſt he ſtings in heat of day,
From cattle *great* with young keep thou away. *May.*

It is added in every ſtep of aſcending or deſcending conſanguinity; *great* grandſon is the ſon of the grandſon.—I dare not yet affirm for the antiquity of our language, that our *great-great-great* grandſires tongue came out of Perſia. *Camden.*—Hard; difficult: grievous. A proverbial expreſſion.—It is no *great* matter to live lovingly with good-natured and meek perſons. *Taylor.*

GREAT, *ſ.* The whole; the groſs; the whole in a lump.—Carpenters build an houſe by the *great*, and are agreed for the ſum of money. *Moxon.*

To let out thy harveſt by *great* or by day,
Let this by experience lead thee the way:
By *great* will deceive thee with ling'ring it out. *Tuſſer.*

GREAT, a river of Canada, which runs into the river St. Laurence: ſeven leagues below Quebec.

GREAT BAR'RINGTON, a townſhip of the American States, in the ſouth-weſtern part of the State of Maſſachuſetts, in Berkſhire county, lying ſouth of Stockbridge, 150 miles weſt of Boſton, and twenty-ſix eaſt-by-ſouth of Hudſon city, New-York.

GREAT BAY', a bay of North America, at the mouth of the Piſcataqua river, between Portſmouth and Exeter, in the ſtate of New Hampſhire.

GREAT BEAR', one of the conſtellations in the northern hemiſphere. See URSA MAJOR.

GREAT BEAR LA'KE, a water which runs weſtward, and flows into M'Kenzie's river in the north-weſt part of North America; not far from the arctic circle. Its mouth is 250 yards wide.

GREAT BRI'TAIN, the largeſt, richeſt, and moſt populous, iſland in Europe, comprehending South and North Britain, now called England and Scotland, with the principality of Wales; extending from the Lizard point, in north latitude 50°, to Dungſby-head, in north latitude 58° 30′ nearly. Its form approaches ſomewhat to the ſhape of an irregular triangle, the extremities of which are terminated by three promontories, projecting in different directions, viz. the Land's End, in Cornwall, towards the weſt; the North Foreland, in Kent, towards the eaſt; and Dungſby-head, in Caithneſs, towards the north; and the circuit of its three ſides, allowing for the windings of the coaſt, contains, by a general eſtimate, about 1800 miles; but, if it were a perfect triangle, the length of its three ſides would meaſure about 1520 Britiſh miles. It is bounded on the north by the Northern Ocean; on the weſt by the Atlantic and the Iriſh Sea, which ſeparates it from Ireland; on the ſouth by the Britiſh Channel, which divides it from France; and on the eaſt, towards Germany, by the North Sea and German Ocean.

It has been aſſerted, that Great Britain, in times of remote antiquity, was united with the continent. The entire ſeparation of Great Britain from the continent muſt have happened, according to the conjectures of Mr. Kirwan, as ſtated in the Iriſh Tranſ. vol. vi. p. 301, long after the deluge; and that of Ireland from Great Britain at a ſtill later period: for wolves and bears were

anciently found in both, and these must have passed from the continent into Britain, and hence into Ireland, as their importation could never have happened. The convulsion that separated Britain from Germany seems, according to this writer, to have been directed from north to south, but gradually weakened in its progress. Hence that island is sharpened to the northward; but the impression must have been considerably enfeebled by the opposition of the granitic mountains that form the Shetland and Orkney isles. The broken fragments of the calcareous or argillaceous materials of the more southern parts, presented less resistance, were more easily preyed upon, and gave way to what is now called the German Ocean; while these materials themselves were spread over Westphalia, or formed the subsoil of Flanders, Holland, and the sand-banks on its coast. The rupture of the isthmus that joined Calais and Dover was probably effected by an earthquake at a later period, and became gradually widened by tides and currents. Ireland was shielded by Scotland from the violence of the northern shock; and hence its separation from Scotland appears to have been late and gradual. That from England was probably diluvial, and effected by a southern shock. These changes, says Mr. Kirwan, happened at least 3600 years ago.

The division of this island into North Britain and South Britain, is evidently of the most remote antiquity; and the jealousy and perpetual warfare which continually disturbed and disgraced the sister kingdoms, were, for the sake of peace and harmony, above all other considerations, the principal, if not the most desirable, motives for an union. But the amelioration of mankind seems to have taken place only in proportion to the progress of civilization; whilst the happiness of individuals has depended on the security given to their civil and religious liberties. Happily for the people of Great Britain, these seeds were early sown in a congenial soil, and guarded with the jealous eye and fostering care of our ancestors. Yet though the people were jealous of their liberties, they were no less sedulous to maintain the rights of their kings, even in the earliest state of the monarchy. All the prerogatives and rights of the Anglo-Saxon kings were definite and ascertained. They were such as had become established by law or custom, and could be as little exceeded by the sovereign as withheld by his people. They were not arbitrary privileges of an unknown extent. Even William the Conqueror found it necessary to have an official survey of the royal rights taken in every part of South Britain; and we find the hundred, or similar bodies in every county, making the inquisition to the king's commissioners, who returned to the sovereign that minute record of his claims upon his subjects, which constitutes the Doomsday-book. The royal claims in Doomsday-book were, therefore, not the arbitrary impositions of the throne, but were those which the people themselves testified to their king to have been his legal rights. Perhaps no country in Europe can exhibit such an ancient record of the freedom of its people, and the limited prerogatives of its ruler.

It is curious to remark, that the local denominations by which the various places in England are still known, were fixed and ascertained by the same record: for whoever will take the trouble to compare the names in Doomsday-book, which prevailed in the island during the time of the Confessor, with the present appellations of the same places, will find that the greatest number of them correspond. The hundreds in the county of Suffex were sixty-three, and still remain so: of these thirty-eight bore the same names as now; and of the villæ or maneria, which are about three hundred and forty-five, there are two hundred and thirty with appellations like their present. The following list will shew the correspondencies between the ancient and modern names of the counties which occur in Doomsday-book:

Chenth.	Warwicscire.	Herefordscire.
Sudsexe.	Staffordscire.	Grentebrigescire.
Sudrie.	Sciropscire.	Huntedunscire.
Hantescire.	Ceastrescire.	Bedefordscire.
Berrochescire, or Bercheſcire.	Derbyscire.	Northantonescire.
	Snotinghamscire.	Ledescestrescire.
	Midelsexe.	Roteland.
Wiltescire.	Hertfordscire.	Eurvicscire.
Dorsete.	Bockinghamscire.	Lincolescire.
Sumersete.	Oxenfordscire.	Exsessa.
Devenescire.	Gloweceſterscire.	Nordfolc.
Cornvalgie.	Wirecestrescire.	Sudfolc.

London is mentioned in Bede as the metropolis of the East Saxons in the year 604, lying on the banks of the Thames, "the emporium of many people coming by sea and land."

All the probable facts and conjectures relative to the first settlement and population of this island, have been already stated under the article ENGLAND. With respect to the present population of Great Britain, it has been variously estimated; some reckoning it at 7,000,000, and others at more than 12,000,000. But in the year 1800 an act was passed, for taking an account of the population of Great Britain, and of the increase or diminution thereof. From an abstract of the returns made to parliament in consequence of this act, the following result was deduced:

POPULATION OF ENGLAND.

Inhabited Houses.	*Families.*	*Uninhabited Houses.*	*Males.*	*Females.*	*Total of Persons.*
1,467,870	1,778,420	53,965	3,987,935	4,343,409	8,331,434
WALES.					
108,053	118,503	3,511	257,178	284,368	541,546
Army					198,331
Navy					126,279
Seamen in registered vessels					144,558
Convicts					1,410
GRAND TOTAL.					
1,575,923	1,896,723	57,476	4,715,711	4,627,867	9,343,578

It is ascertained, that Scotland contains nearly 1,700,000 inhabitants, and it is known, with sufficient accuracy, that the population of Ireland rather exceeds 4,000,000. We may therefore safely affirm, that the population of the United Kingdom exceeds fifteen millions; and it appears from the collection of all the parish registers of England and Wales, throughout the last century (under the population act), that our population has increased with very accelerated rapidity the nearer we approach the present time. If to the population of the metropolis (864,000) the regiments of guards, and militia in London, and the seamen on-board the registered vessels in the river Thames, were added, it would undoubtedly exceed 900,000 souls; almost a tenth part of the population of England and Wales.

CITIES AND TOWNS.

	Males.	*Females.*	*Total.*

Scotland and Ireland are nearly equal to each other in area, and together are equal to England and Wales: wherefore the population of Scotland being 1,600,000, averages at 55 to a ſquare mile; and the population of Ireland being about 4,250,000, averages at 146 to a ſquare Britiſh mile. The United Kingdom averages at 130 to a ſquare mile, including about 470,000 ſoldiers and ſailors.

With regard to the whole population of the widely-extended dominions of Great Britain, M. Mentelle, in his "Geographie Statiſtque," has very ingeniouſly contraſted it with that of France, in the following manner: The French Republic is ſaid at this time, (1807,) to have an extent nearly equal to that of Gaul in the time of the Romans, the empire compriſing all the countries which formed monarchical France, with the following additions, viz. the comptât of Avignon, the duchy of Bouillon, the republic of Mulhauſen, the principalities of Montbeliard, Porentruy, and Salm, the republic of Geneva, the comté of Nice, Savoy, Piedmont, Belgium, Dutch Flanders, Dutch Brabant, with all the territory on the left bank of the Rhine, Maeſtricht, Venloo, and their dependencies, and the iſle of Elbe. In this general view of modern France, the admeaſurement of her ſurface is ſtated at 31,385 ſquare leagues, and her population at 34,468,312; but we infer that Genoa is not included in either, as Leghorn is not mentioned among the ports of France; nor are either of the three Genoeſe departments inſerted in the liſt of the departments compoſing the French republic. The population of the iſle of Elbe is alſo expreſsly excluded from the above ſtatement.

Great, however, as this number appears, the author has repreſented the population belonging to the Britiſh monarchy as far exceeding it: but, in order to effect this object, the electorate of Hanover is joined to Great Britain and Ireland, with all the dependent iſles, as conſtituting our European poſſeſſions; to which part of our empire in the eaſt, and our colonies, are added. The account ſtands thus:

The extent of the territory in Europe belonging to the Britiſh monarchy contains 17,160 ſquare leagues.

The European population is	14,303,087
Poſſeſſions in Canada 38,000 ſquare leagues; population	23,000,000
In America	1,000,000
In 1801, by the treaty of Amiens, the iſland of Ceylon was ceded to the Engliſh, containing 4,800 ſquare leagues; population	4,000,000
Conquered in 1779, chiefly from Tippoo Saib, 5,730 ſquare leagues; population about	4,000,000
Total of the population	46,303,087

It is not difficult to penetrate the motive of this French writer, for his wonderful diſplay of Britiſh population. England, perhaps, is to be told that, with a population at command of 46,303,087, ſhe ought not to be alarmed at the aggrandizements of France; which, including the conquered countries, counts her inhabitants at only thirty-four millions and a half. On the contrary, we know that our diſtant poſſeſſions drain our population; and that, though they add to the riches, they do not augment the phyſical ſtrength, of the ſtate.

This fact may probably not be believed by thoſe who are advocates for foreign conqueſts; nor the evil ſufficiently guarded againſt, until dear-bought experience convinces us of the miſtake. Perhaps the diſcomfiture of the whole imperial army, in the late German war, was alone owing to the miſtaken policy of dividing the forces and marching them to diſtant and disjoined operations, inſtead of connecting their poſitions and concentrating their ſtrength. Let us hope that a ſimilar policy may not be the error of the rulers of Great Britain. The Engliſh forces are undoubtedly formidable; and when acting in concert with our invincible navy, their combined ſtrength will probably for ever be found an overmatch for the united machinations of all the enemies of Great Britain; but when this force is broken into parts, and large portions thereof, employed in diſtant foreign conqueſts, the means of ſelf-defence muſt neceſſarily be weakened. Thus while one diviſion of our army is engaged in ſecuring the Cape of Good Hope, and ameliorating and ſubjugating ſouthern Africa; while another armament

armament is employed in the re-conqueſt of Egypt; a third deſtined to ſeize upon the Spaniſh ſettlements and gold-mines in South America; and a fourth employed in the conqueſt of Turkey in Europe; beſides the number of men requiſite to protect our dominions in Aſia and the Weſt Indies; it becomes evident that our united ſtrength muſt be impaired at home, while a temptation is held out to our implacable enemy to riſk the perils of an invaſion. Better and wiſer would it be for us, perhaps, to let theſe viſionary conqueſts alone; remembering that the acquiſition of the gold-mines of South America was the ruin of Spain; while induſtry, commerce, and the encouragement of our extenſive manufactures, have proved the aggrandiſement and ſinews of Great Britain.

Concerning the SOVEREIGNTY OF THE SEAS, ſo long claimed by Great Britain, and ſo loudly oppoſed by the court of France; it may here be proper to ſtate the facts relative to its origin, and the ſpirit and perſeverance with which it has been maintained by our forefathers. With reſpect to the *right*, as founded in nature, it ſeems reaſonable to admit, that ſince geographers have demonſtrated that more than two thirds of this globe is covered with water, and that the principal part thereof conſiſts in immenſe tracts of an unbounded ocean, over which no private claim or individual authority could have been originally ſet up, it follows, that he who ſhould *firſt* poſſeſs, and occupy, and defend, and make ſubſervient to his uſes, any particular parts of theſe immenſe ſeas, would be clearly entitled to the occupancy of them, to the utmoſt limit that ſuch occupancy could be maintained, exerciſed, and defended. With reſpect to the *juſtice* of the thing, we need only refer to thoſe diſtricts of the ſea which are claimed as fiſheries, by different ſovereigns; for on the right above laid down, can the claim to thoſe fiſheries alone be maintained. And with reſpect to the *law of nations*, it is abundantly evident that every maritime power on the ſurface of the globe has from time to time endeavoured to poſſeſs, and that *excluſively*, as much of the contiguous ſea as their nautical abilities would enable them to occupy and defend, even from the remote era of the Phœnicians, to the period of the importunate ſolicitation of Napoleon I. to poſſeſs "fleets, and ſhips, and commerce, and a large portion of the dominion of the ocean," in common with the Engliſh. The charge, therefore, that Great Britain has unjuſtly monopolized the ſovereignty of the ſeas, appears to be founded in error and in envy; inaſmuch as every other maritime power has endeavoured to avail itſelf of the ſame advantage; and as it has been ſolely owing to the ſuperior induſtry, policy, and bravery, of the Engliſh people, that they have ſucceeded in this grand eſtabliſhment of their authority, and left all their competitors at a vaſt diſtance behind them. How this came ſo fortunately to happen, we ſhall next endeavour to point out.

The early eſtabliſhment of a defenſive and offenſive fleet, was a regulation which our anceſtors, who were more verſed in the practical philoſophy of life than the ſpeculative one of the cloſet, thought neceſſary for the welfare and ſafety of the kingdom. Reaſoning from the ſelf-preſervation of an individual to the ſelf-preſervation of a people, they conſidered the defence of this iſland from foreign invaſion, as the firſt law in national policy; and judging that the dominion of the land could not be preſerved without poſſeſſing that of the ſea, they made every effort to procure to the nation a maritime power fully adequate to this moſt ſalutary purpoſe. Thus, in proceſs of time, the navy of England was univerſally allowed to excel all others for three things, viz. beauty, ſtrength, and ſafety; for beauty, our ſhips of war became ſo many floating palaces; for their ſtrength, ſo many moving caſtles; and for ſafety, they are unqueſtionably the moſt defenſive walls of the land; and as our naval power gained us authority in the moſt diſtant climates, ſo the ſuperiority of our fleet above other nations, for ages rendered the Britiſh monarch the arbiter of Europe.

The kings of England in ancient times commanded their fleets in perſon; and king Arthur vindicated the dominion of the ſeas, making ſhips of all nations ſalute our ſhips of war by lowering the topſail, and ſtriking the flag, as in like manner they were accuſtomed to do to the forts upon land; by which ſubmiſſion they were put in mind that they were come into a territory, wherein they had to own a ſovereign power and juriſdiction, and receive protection from it: and this duty of the flag, which was conſtantly paid to our anceſtors, ſerved to imprint a reverence in foreigners, and added new courage to the Britiſh ſeamen; for it was contended, that reputation abroad is the principal ſupport of the government at home.

King Edgar, ſucceſſor to Arthur, firſt ſtiled himſelf *Sovereign of the narrow ſeas*; and having fitted out a fleet of four hundred ſail of ſhips, in the year 937, ſailing about Britain with his mighty navy, and arriving at Cheſter, was there met by eight kings and princes of foreign nations come to do him homage; who, as an acknowledgment of his ſovereignty, rowed this monarch in a boat down the river Dee, himſelf ſteering the boat; a marine triumph which is not to be paralleled in the hiſtories of nations.

Canute (Edgar's ſucceſſor) laid the ancient tribute called *Danegeld*, for guarding the ſeas, and maintaining the ſovereignty of them; with the following emblem expreſſed, viz. Himſelf ſitting on the ſhore in his royal chair while the ſea was flowing, ſpeaking, *Tu meæ ditionis es, & terra in qua ſedeo eſt, &c.* Egbert, Alfred, and Ethred, kept up the dominion and ſovereignty of their predeceſſors; nor did the ſucceeding princes, of the Norman race, waive this great prerogative, but maintained the right to the four adjacent ſeas ſurrounding the Britiſh ſhore: the honour of the flag king John challenged, not barely as a civility, but a right to be paid *cum debitâ reverentiâ*, and the perſons refuſing he commanded to be taken as enemies: and the ſame ſubmiſſion was ordained not only to be paid to whole fleets, bearing the royal ſtandard, but to thoſe ſhips of privilege that wore the prince's enſigns or colours of ſervice: this decree was confirmed and bravely aſſerted by a fleet of five hundred ſail, in a royal voyage to Ireland, wherein he made all the veſſels which he met with in his way, in the eight circumfluent ſeas, to pay that duty and acknowledgment, which has been ever ſince maintained by our kings, and was never conteſted by any nation, unleſs by thoſe who occaſionally threatened the conqueſt of the whole empire.

Trade gave occaſion to the bringing mighty fleets to ſea; and on the increaſe of trade, ſhips of war were neceſſary in all countries for the preſervation of it in the hands of the juſt proprietors. In ancient times the ſeveral counties of England were liable to a particular taxation for building ſhips of war, and fitting out fleets, every one in proportion to their extent and riches; ſo that the largeſt counties were each of them to furniſh a firſt-rate man of war, and the others every one to build one in proportion; but this method has been long diſuſed, and the fitting out our navy for many ages has been thrown into the public charge. King Edward III. in his wars with France, had a fleet of ſhips before Calais, ſo numerous, that they amounted to ſeven hundred ſail; but theſe were only ſmall veſſels.

Notwithſtanding that the fleets of Great Britain have been remarkable for ſeveral ages paſt, for the great and ſignal victories obtained from time to time over their enemies, and that in the reigns of ſome of our ancient kings, there have been greater numbers of ſhips fitted out at different times, upon certain expeditions, than have been of late years, yet that of a royal navy was never properly eſtabliſhed, until by Henry VIII. in the

fourth year of his reign, anno 1512; at which time, that king, taking umbrage at the mighty naval preparations of France, made an augmentation of twenty-five large ſhips of war to thoſe already in being; he likewiſe erected an office for the navy, and eſtabliſhed a certain number of commiſſioners, to whom the charge of the navy was committed, and whoſe duty it was to inſpect into the ſtate and condition of the king's ſhips, and to make a report thereof to the lord high admiral, in order to their being repaired or rebuilt, and ſupplied with every thing neceſſary for the public ſervice, according as the caſe required it; for till that time, the eſtabliſhment of the naval forces of this kingdom ſeems to have been upon an auxiliary dependency of the ſea-ports and maritime towns, who were under certain conditions of furniſhing their reſpective quotas of ſhips, for the king's uſe, upon previous notice given to them in that behalf; after which, they all came to the appointed rendezvous, and were then diſpoſed of by the king's order upon the ſervices intended. Upon this augmentation, the king's fleet at that time conſiſted of no more than forty-five ſhips, with which that of the French was ſoon overcome. Of thoſe towns which furniſhed ſhips for the public ſervice, the Cinque-ports were the moſt noted, and whoſe privileges ſtill ſubſiſt, on account of the ſervices which they obliged themſelves in particular to perform to the crown.

There are liſts of the fleet of queen Elizabeth, which make it appear, that there was but one private gentleman a captain, all the reſt being lords and knights: ſo high was the eſteem for ſervice at ſea in thoſe days, when our princes ruled with the moſt conſummate glory: but the opinion of ſerving at ſea in later times having been very much leſſened, it has ſince been too much declined by the nobility.

A memorable inſtance, however, of the bravery of one of our noblemen, the duke of Albemarle, who commanded one diviſion of the Engliſh ſquadron in the Dutch war of 1666, ought for ever to ſtand upon record. On the 2d of June in that year, in a council of war, held for the purpoſe of conſidering how far it would be prudent to renew the action on that day, after having loſt two ſhips in the action of the preceding, namely, the Swiftſure and the Eſſex, which were taken by the Dutch fleet commanded by Van Tromp and De Ruyter in the Engliſh channel, the duke of Albemarle delivered his opinion as follows: "That if we had dreaded the numbers of our enemies, we ſhould have fled yeſterday; but though we are inferior to them in ſhips, we are in all things elſe ſuperior. Force gives them courage. Let us, if we need it, borrow reſolution from the thoughts of what we have formerly performed. Let the enemy feel, that, though our fleet be divided, our ſpirit is entire. At the worſt it will be more honourable to die bravely here on our own element, than to be made ſpectacles to the Dutch. To be overcome is the fortune of war, but to fly is the faſhion of cowards. Let us teach the world, THAT ENGLISHMEN WOULD RATHER BE ACQUAINTED WITH DEATH THAN WITH FEAR."

The maritime ſtate, ſays Blackſtone, though nearly related to the military, is much more agreeable to the principles of our free conſtitution. The royal navy of Great Britain hath ever been its greateſt defence and ornament; it is its ancient and natural ſtrength, the floating bulwark of the iſland: an army from which, however ſtrong and powerful, no danger can ever be apprehended to liberty: and accordingly it has been aſſiduouſly cultivated, even from the earlieſt ages. To ſo much perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the Laws of Oleron, and are received by all nations in Europe as the ground of their marine conſtitutions, was confeſſedly compiled by our king Richard I. at the iſle of Oleron, on the coaſt of France, then part of the poſſeſſions of the crown of England.

And yet ſo vaſtly inferior were our anceſtors in this point, to the preſent age, that, even in the maritime reign of queen Elizabeth, ſir Edward Coke thinks it matter of boaſt, that the royal navy of England then conſiſted of thirty-three ſhips. The preſent condition of our marine is in a great meaſure owing to the ſalutary proviſions of the ſtatutes called the Navigation Acts; whereby the conſtant increaſe of Engliſh ſhipping and ſeamen was not only encouraged, but rendered unavoidably neceſſary.

At the ſame time that the good economy of the royal navy is diſplayed, it ſeems neceſſary to take ſome notice of that, which affords it an opportunity of appearing in more magnificent grandeur than can be repreſented by the ableſt writer in the world; namely, the *ocean* on which it is borne; eſpecially as there is a peculiar ſovereignty and property inherent therein, to the monarchs of Great Britain; the preſervation of which, for ages paſt, has ſo much conduced to increaſe the glory of the nation. This right is ſo ancient and undeniable, that even the moſt haughty of our neighbours dare not controul it, however they may preſume to contradict it by vaunting words; neither was any thing ever written againſt it until it was undertaken by Hugo Grotius, in his book called *Mare liberum*.

The boundaries properly ſaid to encompaſs what are called the Britiſh Seas, are thus accounted, under the diſtinction of the four cardinal points of the compaſs; taking it for granted in general, that all the ſeas which ſurround Great Britain, Ireland, and the other iſlands appertaining to the crown, are called the Britiſh Seas; but as to particulars they ſtand thus: On the ſouth is the Britiſh Channel, which ſeparates England from France, the boundaries of which extend to the oppoſite ſhores of France, and to thoſe of Spain, as far as Cape Finiſterre. From that Cape it extends on the weſt in an imaginary line running in twenty-three degrees of weſt longitude from London, to the latitude of ſixty-three degrees north, which laſt is called the Weſtern Ocean of Britain. From the aforeſaid latitude of ſixty-three degrees, it extends in a line (ſuppoſed to be drawn) in that parallel of latitude, to the middle point of the land, Van Staten, on the coaſt of Norway, which is the northern boundary, and from that point it extends along the ſhores of Norway, Denmark, Germany, and the Netherlands, to the channel firſt mentioned; which laſt boundary comprehends what is called the Eaſtern Ocean of Britain.

There being no lands lying on the weſt and north ſides of the Britiſh dominions, nearer than the continent of America, the iſland of Newfoundland, and Greenland; and the king of Great Britain having poſſeſſions in the two firſt places, the boundaries of his maritime empire cannot be ſaid to be ſtrictly limited on that ſide. Moreover, as to Greenland, it was at firſt diſcovered in the reign of Edward VI. by ſir Hugh Willoughby, for the uſe of the crown of England; and ſtill again to the northward there is ſome foundation for extending this ſovereignty a great deal farther, on account of the acquiſitions of king Arthur, a record of which is to be found in Hackluyt, p. 245, tranſlated from the Latin original there quoted from Geoffrey of Monmouth's Hiſtory.

According to this ancient right, the Britiſh dominion on the North Sea is very extenſive; and ſo far from being queſtioned, or the trade of the Britiſh ſubjects in thoſe parts obſtructed, that on the contrary, (without regard to the above relation concerning king Arthur,) Britain has a prior right even to Denmark and Norway in the Greenland fiſhery, and in Davis's Streights; theſe places being unknown to them, and the reſt of Europe, till John Davis's voyage for diſcovery of the north-weſt paſſage in the year 1585; though it ſeems that the Danes afterwards demanded toll for our fiſhing at Greenland, but it was refuſed to them.

In the eſtabliſhment of fiſheries, as well as in all the relative incitements to commerce, it has been the wiſdom of the legiſlature to provide a nurſery for ſeamen, and ſeems at all times to have been the object of our government, that the merchants ſhould own as many ſhips, and employ as many *native* mariners, as poſſible. To induce, and ſometimes to *force* them to this application of their capital, reſtrictions and prohibitions were deviſed. Theſe affected not only foreigners but natives. The intereſts of commerce were often ſacrificed to this object. Trade was conſidered principally as the means of promoting the employment of ſhips, and was encouraged chiefly as it conduced to the one great national object, *the naval ſtrength of the country*. This policy was purſued by thoſe who came after them in directing the public councils; and in the ſeventeenth century, when many inſtitutions of our anceſtors fell a ſacrifice to the rage of reformation, the wiſdom of the Navigation Syſtem, or Sovereignty of the Seas, was again reſpected.

If the wiſdom of any ſcheme of policy is to be meaſured by its effects and conſequences, this navigation ſyſtem is entitled to the praiſe of having attained the end for which it was deſigned. Whether we regard the primary or inferior objects in this ſyſtem, whether it is the increaſe of ſhipping, the extenſion of our foreign trade, or the ſtrength of our navy, they have all advanced to a degree of conſideration unexampled; and they owe that advancement entirely to our ability in preſerving the Sovereignty of the Seas.

The increaſe of our trade and naval ſtrength has kept pace with that of our ſhipping and navigation. We can reflect with pride, that our foreign trade, combined with our manufactures and domeſtic induſtry, enables us to raiſe annually *ſixteen millions* of money with more eaſe, than four millions were raiſed during the reign of king William: and this upon a people, who, in their different ranks, enjoy more riches, more competency, and more comfort, than any people in Europe; and who are more induſtrious, becauſe they are better protected by a conſtitution, which has been progreſſively improving, both in theory and practice, ever ſince the ſuperiority of our naval tactics enabled us to reſcue the carrying trade from the Dutch.

The Sovereignty of the Seas has at no period of our hiſtory been more completely defended and maintained than in our own time, by that able and invincible hero Horatio lord viſcount Nelſon. His victories of Aboukir Bay, Copenhagen Sound, and Trafalgar, have immortaliſed his name. The two former of theſe celebrated engagements have already been detailed under the article ENGLAND, vol. vi. p. 790–794; but that of Trafalgar, having occurred ſince that article was ſent to the preſs, and being the moſt complete and deciſive victory ever gained on the open ſeas, we conſider it of national importance to record it in this place. And ſince there the brave Nelſon glorioufly fell, and enviably died in the bed of honour in the midſt of this engagement, we cannot adhere more to truth and fact, than by ſtating the intereſting particulars from the official diſpatch of him who ſo meritorioufly ſucceeded to the chief command, namely admiral lord Collingwood.

On Monday the 21ſt of October 1805, at day-light, when Cape Trafalgar bore eaſt by ſouth about ſeven leagues, the enemy was diſcovered ſix or ſeven miles to the eaſtward, the wind about weſt, and very light; the commander in chief immediately made the ſignal for the fleet to bear up in two columns, as they are formed in order of ſailing; a mode of attack which lord Nelſon had previouſly directed, to avoid the inconvenience and delay in forming a line of battle in the uſual manner. The enemy's line conſiſted of thirty-three ſhips, (of which eighteen were French and fifteen Spaniſh,) commanded in chief by admiral Villeneuve. The Engliſh conſiſted of only twenty-ſeven ſhips of the line. The Spaniards, under the direction of Gravina, wore with their heads to the northward, and formed the line of battle with great cloſeneſs and correctneſs; but as the mode of attack was unuſual, ſo the ſtructure of their line was new; it formed a creſcent, convexing to leeward; ſo that, in leading down to their centre, I had both their van and rear abaft the beam: before the fire opened, every alternate ſhip was about a cable's length to windward of her ſecond a-head and a-ſtern, forming a kind of double line, and appeared, when on their beam, to leave a very little interval between them; and this without crowding their ſhips. Admiral Villeneuve was in the Bucentaur in the centre, and the prince of Aſturias bore Gravina's flag in the rear; but the French and Spaniſh ſhips were mixed without any apparent regard to order of national ſquadron.

As the mode of our attack had been previouſly determined on, and communicated to the flag officers and captains, few ſignals were neceſſary, and none were made, except to direct cloſe order as the lines bore down. The commander in chief in the Victory led the weather column, and the Royal Sovereign, which bore my flag, the lee. The action began at twelve o'clock, by the leading ſhips of the columns breaking through the enemy's line, the commander in chief about the tenth ſhip from the van, the ſecond in command about the twelfth from the rear, leaving the van of the enemy unoccupied; the ſucceeding ſhips breaking through, in all parts, aſtern of their leaders, and engaging the enemy at the muzzles of their guns: the conflict was ſevere; the enemy's ſhips were fought with a gallantry highly honourable to their officers, but the attack on them was irreſiſtible, and it pleaſed the Almighty Diſpoſer of all Events to grant his majeſty's arms a complete and glorious victory. About three P. M. many of the enemy's ſhips having ſtruck their colours, their line gave way: admiral Gravina, with ten ſhips, joining their frigates to leeward, ſtood towards Cadiz. The five headmoſt ſhips in their van tacked, and ſtanding to the ſouthward, to windward of the Britiſh line, were engaged, and the ſternmoſt of them taken; the other four went off, leaving to his majeſty's ſquadron nineteen ſhips of the line, (of which two are firſt-rates, the Santiſſima Trinidad and the Santa Anna,) with three flag officers, viz. admiral Villeneuve, the commander in chief; don Ignatio Maria d'Alava, vice admiral; and the Spaniſh rear-admiral don Baltazar Hidalgo Ciſneros.

After ſuch a victory it may appear unneceſſary to enter into encomiums on the particular parts taken by the ſeveral commanders; the concluſion ſays more on the ſubject than I have language to expreſs; the ſpirit which animated all was the ſame; when all exerted themſelves zealouſly in their country's ſervice, all deſerve that their high merits ſhould ſtand recorded; and never was high merit more conſpicuous than in the battle I have deſcribed.—The Achille (a French 74), after having ſurrendered, by ſome miſmanagement of the Frenchmen took fire and blew up; two hundred of her men were ſaved by our tenders.

A circumſtance occurred during the action, which ſo ſtrongly marks the invincible ſpirit of Britiſh ſeamen when engaging the enemies of their country, that I cannot reſiſt the pleaſure I have in making it known to their lordſhips; the Temeraire was boarded at once by a French ſhip on one ſide, and a Spaniard on the other; the conteſt was vigorous; but, in the end, the combined enſigns were torn from the poop, and the Britiſh hoiſted in their places.

Such a battle could not be fought without ſuſtaining a great loſs of men. I have not only to lament, in common with the Britiſh navy and the Britiſh nation, in the fall of the commander in chief, the loſs of a hero, whoſe name will be immortal, and his memory ever dear to his country; but my heart is rent with the moſt poignant grief for the death of a friend, to whom, by many years intimacy, and a perfect knowledge of the virtues

of his mind, which inſpired ideas ſuperior to the common race of men, I was bound by the ſtrongeſt ties of affection; a grief to which even the glorious occaſion in which he fell, does not bring the conſolation which perhaps it ought; his lordſhip received a muſket ball in his left breaſt, about the middle of the action; he ſent an officer to me immediately with his laſt farewell, and ſoon after expired.—Having thus detailed the proceedings of the fleet on this occaſion, I beg to congratulate their lordſhips on a victory, which, I hope, will add a ray to the glory of his majeſty's crown, and be attended with public benefit to our country. I am, &c.

C. COLLINGWOOD.

Of the ten ſhips which ſtood for Cadiz, nine, with the utmoſt difficulty, got into port; but the four headmoſt ſhips of the enemy's van, which went off to ſea, fell in with ſir Richard Strachan's ſquadron on the 4th of November, and were all captured. The following is an official ſtatement of the names of the ſhips and commanders in the enemy's line of battle, ſhewing how they were diſpoſed of:

1. Spaniſh ſhip San Ildefonſo, of 74 guns, brigadier don Joſeph de Vargas; ſent to Gibraltar.

2. Spaniſh ſhip San Juan Nepomuceno, of 74 guns, brigadier don Coſme Churruca; ſent to Gibraltar.

3. Spaniſh ſhip Bahama, of 74 guns, brigadier don A. D. Galiana; ſent to Gibraltar.

4. French ſhip Swiftſure, of 74 guns, monſieur Villemadrin; ſent to Gibraltar.

5. Spaniſh ſhip Monarca, of 74 guns, don Jeodoro Argumoſa; wrecked off San Lucar.

6. French ſhip Fougueux, of 74 guns, Monſ. Brandouin; wrecked off Trafalgar, all periſhed, and thirty of the Temeraire's men.

7. French ſhip Indomptable, of 84 guns, Monſ. Hubert; wrecked off Rota, all periſhed.

8. French ſhip Bucentaur, of 80 guns, admiral Villeneuve, commander in chief; captains Prigny and Magendle; wrecked on the Porques, ſome of the crew ſaved.

9. Spaniſh ſhip San Franciſco de Aſis, of 74 guns, don Luis de Flores; wrecked near Rota.

10. Spaniſh ſhip El Rayo, of 100 guns, brigadier don Henrique Macdonel; wrecked near San Lucar.

11. Spaniſh ſhip Neptuno, of 80 guns, brigadier don Cayetano Valdes; wrecked between Rota and Catolina.

12. French ſhip Argonaute, of 74 guns, monſieur Epron; on-ſhore in the port of Cadiz.

13. French ſhip Berwick, of 74 guns, Monſ. Camas; wrecked to the northward of San Lucar.

14. French ſhip Aigle, of 74 guns, Monſ. Courrege; wrecked near Rota.

15. French ſhip Achille, of 74 guns, Monſ. de Nieuport; burnt during the action.

16. French ſhip Intrepide, of 74 guns, monſieur Infornet; burnt by the Britannia.

17. Spaniſh ſhip San Auguſtin, of 74 guns, brigadier don Felipe X. Cagigal; burnt by the Leviathan.

18. Spaniſh ſhip Santiſſima Trinidad, of 140 guns, rear admiral don Baltazar H. Ciſneros; brigadier don F. Uriante; ſunk by the Prince, Neptune, &c.

19. French ſhip Redoutable, of 74 guns, monſieur Lucas; ſunk aſtern of the Swiftſure; Temeraire loſt thirteen, and Swiftſure five, men.

20. Spaniſh ſhip Argonauta, of 80 guns, don Antonio Parejo; ſunk by the Ajax.

21. Spaniſh ſhip Santa Anna, of 112 guns, vice-admiral don Ignacio D'Alava; captain don Joſeph de Gardoqui; taken, but got into Cadiz in the gale, diſmaſted.

22. French ſhip Algeziras, of 74 guns, rear-admiral Magon (killed); captain Monſ. Bruaro; taken, but got into Cadiz in the gale, diſmaſted.

23. French ſhip Pluton, of 74 guns, Monſ. Coſman; returned to Cadiz in a ſinking ſtate.

24. Spaniſh ſhip San Juſte, of 74 guns, don Miguel Gaſton; returned to Cadiz, has a foremaſt only.

25. Spaniſh ſhip San Leandro, of 64 guns, don Joſeph de Quevedo; returned to Cadiz, diſmaſted.

26. French ſhip Neptune, of 84 guns, Monſ. Maiſtral; returned to Cadiz.

27. French ſhip Heros, of 74 guns, Monſ. Poulain; returned to Cadiz, lower maſts in, and admiral Rotelle's flag on-board.

28. Spaniſh ſhip Principe de Aſturias, of 112 guns, admiral don F. Gravina; don Antonio Eſcano, &c. returned to Cadiz, diſmaſted.

29. Spaniſh ſhip Montanez, of 74 guns, don Franciſco Alcedo; returned to Cadiz.

30. French ſhip Formidable, of 80 guns, rear-admiral Dumanoir; hauled to the ſouthward, and eſcaped.

31. French ſhip Mont Blanc, of 74 guns, Monſ. Le Villegries; hauled to the ſouthward, and eſcaped.

32. French ſhip Scipion, of 74 guns, Monſ. Berenger; hauled to the ſouthward, and eſcaped.

33. French ſhip Duguay Trouin, of 74 guns, Monſ. Touffet; hauled to the ſouthward, and eſcaped. Theſe laſt four ſhips were captured by ſir Richard Strachan. The total ſtands thus:

Sent into Gibraltar	- - -	4
Deſtroyed and broken up	- - -	16
In Cadiz, mere wrecks	- - -	6
In Cadiz, ſerviceable	- - -	3 } 9
Taken by ſir Richard Strachan	- -	4
	Total -	33

SHIPS OF THE BRITISH SQUADRON, *with the Number of Killed and Wounded on-board of each.*

1. Victory—4 officers, 3 petty officers, 32 ſeamen, and 18 marines, killed; 4 officers, 3 petty officers, 59 ſeamen, and 9 marines, wounded. Total, 132.

2. Royal Sovereign—3 officers, 2 petty officers, 29 ſeamen, and 13 marines, killed; 3 officers, 5 petty officers, 70 ſeamen, and 16 marines, wounded. Total, 141.

3. Britannia—1 officer, 8 ſeamen, and 1 marine, killed; 1 officer, 1 petty officer, 33 ſeamen, and 7 marines, wounded. Total, 52.

4. Temeraire—3 officers, 1 petty officer, 35 ſeamen, and 8 marines, killed; 3 officers, 2 petty officers, 59 ſeamen, and 12 marines, wounded. Total, 123.

5. Prince. None.

6. Neptune—10 ſeamen, killed; 1 petty officer, 30 ſeamen, and 3 marines, wounded. Total, 44.

7. Dreadnought—6 ſeamen, and 1 marine, killed; 1 officer, 2 petty officers, 19 ſeamen, and 4 marines, wounded. Total, 33.

8. Tonnant—26 killed, 50 wounded. Total, 76.

9. Mars, captain Duff, (killed.)—1 officer, 3 petty officers, 17 ſeamen, and 8 marines, killed; 4 officers, 5 petty officers, 44 ſeamen, and 16 marines, wounded. Total, 98.

10. Bellerophon, captain Cooke, (killed.)—2 officers, 1 petty officer, 20 ſeamen, and 4 marines, killed; 2 officers, 4 petty officers, 97 ſeamen, and 20 marines, wounded. Total, 150.

11. Minotaur—3 ſeamen, killed; 1 officer, 1 petty officer, 17 ſeamen, and 3 marines, wounded. Total, 25.

12. Revenge—2 petty officers, 18 ſeamen, and 8 marines, killed; 4 officers, 38 ſeamen, and 9 marines, wounded. Total, 79.

13. Conqueror—2 officers, and 1 ſeaman, killed; 2 officers, and 7 ſeamen, wounded. Total, 12.

14. Leviathan—2 ſeamen, and 2 marines, killed; 1 petty officer, 17 ſeamen, and 4 marines, wounded. Total, 26.

15. Ajax—2 ſeamen, killed; 9 ſeamen, wounded. Total, 11.

16. Orion—1 ſeaman, killed; 2 petty officers, 17 ſeamen, and 4 marines, wounded. Total, 24.

17. Agamemnon—2 ſeamen killed; 7 ſeamen wounded. Total, 9.

18. Spar-

18. Spartiate—3 ſeamen killed; 1 officer, 2 petty officers, 16 ſeamen, and 1 marine, wounded. Total, 23.

19. Africa—12 ſeamen, and 6 marines, killed; 2 officers, 5 petty officers, 30 ſeamen, and 7 marines, wounded. Total, 62.

20. Belleiſle—2 officers, 1 petty officer, 22 ſeamen, and 8 marines, killed; 3 officers, 3 petty officers, 63 ſeamen, and 19 marines, wounded. Total, 126.

21. Coloſſus—1 officer, 31 ſeamen, and 8 marines, killed; 5 officers, 9 petty officers, 115 ſeamen, and 31 marines, wounded. Total, 200.

22. Achille—1 petty officer, 6 ſeamen, and 6 marines, killed; 4 officers, 4 petty officers, 37 ſeamen, and 14 marines, wounded. Total, 72.

23. Polyphemus—2 ſeamen killed; 4 ſeamen wounded. Total, 6.

24. Swiftſure—7 ſeamen, and 2 marines, killed; 1 petty officer, 6 ſeamen, and 1 marine, wounded. Total, 17.

25. Defence—4 ſeamen, and 3 marines, killed; 23 ſeamen, and 6 marines, wounded. Total, 36.

26. Thunderer—2 ſeamen, and 2 marines, killed; 2 petty officers, 9 ſeamen, and 1 marine, wounded. Total, 16.

27. Defiance—2 officers, 1 petty officer, 8 ſeamen, and 6 marines, killed; 1 officer, 4 petty officers, 39 ſeamen, and 9 marines, wounded. Total, 70.

Total—21 officers, 15 petty officers, 309 ſeamen, and 104 marines, killed; 41 officers, 57 petty officers, 912 ſeamen, and 196 marines, wounded.—Grand Total, 1589.

This ſignal deſtruction of the enemy's marine was quickly followed up by other actions, which tended ſtill more to reduce their navy. On the 6th of February 1806, admiral ſir J. T. Duckworth fell in with a French ſquadron, off St. Domingo in the Weſt Indies, which he engaged; when the following was the reſult:

FRENCH LINE.

L'Alexandre, of 84 guns, capitaine Garreau, 300 killed and wounded.—Taken.

L'Imperiale, of 120 guns, contre-amiral Le Siegle, capitaine Le Pigott; number killed and wounded not known, but certainly many.—On-ſhore, and completely wrecked.

Le Diomede, of 84 guns, capitaine Henry; number of killed and wounded not known, but certainly many.—On-ſhore, and completely wrecked.

Le Jupitre, of 74 guns, capitaine Laiguel; 200 killed and wounded.—Taken.

Le Brave, of 74 guns, capitaine Coude, 260 killed and wounded.—Taken.

Frigates—La Felicité and La Comete.—Eſcaped.

Corvette—La Diligence.—Eſcaped.

BRITISH LINE.

Superb, 74 guns—6 killed and 56 wounded.—62.

Northumberland, 84 guns—21 killed and 79 wounded.—100.

Canopus, 74 guns—8 killed and 22 wounded.—30.

Spencer, 74 guns—18 killed and 50 wounded.—68.

Donegal, 74 guns—12 killed and 33 wounded.—45.

Atlas, 74 guns—8 killed and 11 wounded.—19.

Agamemnon, 74 guns—1 killed and 13 wounded.—14.

Acaſta, Magicienne, Kingfiſher, and Epervier, frigates; not engaged.

Total—74 killed and 264 wounded. In all, 338.

Signed, J. T. DUCKWORTH.

If to the above we add the St. Rafael of 84 guns, and La Firm of 74, taken by ſir Robert Calder in the month of July preceding, and which were part of the combined fleet, we ſhall find that no leſs than THIRTY-SEVEN of the largeſt and fineſt ſhips which formed the enemy's navy were either taken or deſtroyed in the ſhort ſpace of only eight months: an event unparalleled in the hiſtory of nations! And thus has the maritime ſtrength of France and Spain been almoſt annihilated, and the ſovereignty of the ſeas aſſerted and maintained by the navy of Great Britain, from the early period of the reign of king Arthur, quite up to the ſeventh year of the nineteenth century, in which the Britiſh flag ſtill rides triumphantly from pole to pole.

But it is not on the ſeas alone, at this important era, that the Britiſh arms have been diſtinguiſhed. In January 1806, the Cape of Good Hope, with all the extenſive ſettlements of the Dutch in Southern Africa, ſurrendered to major-general ſir David Baird, and commodore ſir Home Popham, after an action on the heights before Cape-town, fought on the 8th of January, in which the enemy loſt upwards of ſeven hundred men in killed and wounded; while that of the Engliſh amounted only to about two hundred. See the article GOOD HOPE, in this volume.

About the ſame period diſpatches were tranſmitted to this country from ſir George Barlow, Bart. in India, with the pleaſing information of the total defeat of Jeſwunt Rao Holkar; and of a treaty of peace having in conſequence been concluded, highly to the advantage of the Britiſh Eaſt-India Company. See the article HINDOOSTAN.

Soon after the conqueſt of the Cape of Good Hope had been effected, and the garriſon of Cape-town made ſecure, ſir Home Popham with the ſquadron under his command, and major-general Beresford with all the troops that could be ſpared by ſir David Baird, ſet ſail for the river La Plata in South America, on an expedition againſt the Spaniſh ſettlement of Buenos Ayres. They touched at St. Helena, and "ſailed thence (ſays general Beresford in his official diſpatch) on the 2d of May, (1806;) and, after a moſt unexpected long paſſage, made Cape St. Mary on the 8th of June. His majeſty's ſhip Narciſſus had been diſpatched from the fleet on the 27th of May, and ſir H. Popham thought it right to proceed in her for the purpoſe of making himſelf acquainted with the navigation of the river, that no delay might occur in proceeding immediately on the arrival of the troops to ſuch a place as our information ſhould firſt induce us to attack. Sir H. Popham and I conſulted whether it would be better firſt to attack the town of St. Philip of Monte Video, or Buenos Ayres, the capital of the provinces; and after much reaſoning, we determined to proceed againſt Buenos Ayres. As ſoon as the wind would permit, June 25th, ſir H. Popham took the ſhipping as near as it was poſſible for them to go, and at a convenient diſtance for diſembarking, which was effected in the courſe of the afternoon and night, and without any oppoſition; the enemy remaining at the village of Reduction, on a height about two miles from us in front: the whole intermediate ſpace, as well as to the right and left, being a perfect flat; but my guide informed me, that though in winter it was impaſſable, it was then very practicable, and eaſy for guns to paſs.

"It was eleven o'clock in the morning of the 26th, before I could move off my ground, and the enemy could, from his poſition, have counted every man I had, the number 1500. He was drawn up along the brow of a hill, on which was the village of Reduction, which covered his right flank, and his force conſiſted principally of cavalry, (I have been ſince informed two thouſand,) with eight field-pieces. The nature of the ground was ſuch, that I was under the neceſſity of going directly to his front; and, to make my line as much as I could equal to his, I formed all the troops into one line, except the St. Helena infantry of one hundred and fifty men, which I formed one hundred and twenty yards in the rear, with two field-pieces, with orders to make face to the right or left, as either of our flanks ſhould be threatened by his cavalry. I had two ſix-pounders on each flank, and two howitzers in the centre of the firſt line. In this order, I advanced againſt the enemy, and after we had got within range of his guns, a tongue of ſwamp croſſed our front, and obliged me to halt whilſt the guns took a ſmall circuit to croſs, and which

which was ſcarcely performed when the enemy opened their field-pieces on us, at firſt well pointed, but as we advanced at a very quick rate, in ſpite of the boggy ground that very ſoon obliged us to leave all our guns behind, his fire did us but little injury. The 71ſt regiment, reaching the bottom of the heights in a pretty good line, ſeconded by the marine battalion, the enemy would not wait their nearer approach, but retired from the brow of the hill, which our troops gaining, and commencing a fire of ſmall arms, he fled with precipitation, leaving to us four field-pieces and one tumbril; and we ſaw nothing more of him that day.

"As ſoon as it was light I ſent captain Kennet, of the engineers, to reconnoitre the ſides of the river, and found that on our ſide we had little or no cover to protect us, whilſt the enemy were drawn up behind hedges, houſes, and in the ſhipping on the oppoſite bank, the river not thirty yards wide. As our guns approached, the enemy opened a very ill-directed fire from great guns and muſquetry; the former ſoon ceaſed after our fire opened; the latter was kept up for more than half an hour, but, though cloſe to us, did us but little or no injury, ſo ill was it directed. We then found means, by boats and rafts, to croſs a few men over the Rio Chuelo; and on ordering all fire to ceaſe, the little of them that remained ceaſed alſo.

"By eleven o'clock, A.M. I had got ſome guns and the greateſt part of the troops acroſs the river; and, ſeeing no ſymptoms of further oppoſition, and learning that the troops in general had deſerted the city, motives of humanity induced me to ſend, by the hon. enſign Gordon, a ſummons to the governor to deliver to me the city and fortreſs, that the exceſſes and calamities which would moſt probably occur if the troops entered in a hoſtile manner, might be avoided, informing him that the Britiſh character would inſure to them the exerciſe of their religion, and protection to their perſons and all private property. He returned to me an officer to aſk ſome hours to draw up conditions; but I could not conſent to delay my march, which I commenced as ſoon as the whole had croſſed the Rio Chuelo; and on arriving near the city, an officer from the governor again met me with a number of conditions, to which I had not then time to attend; but ſaid I would confirm by writing what I had promiſed, when in poſſeſſion of the city; and the terms, granted and ſigned by ſir Home Popham and myſelf, I have the honour to annex." The terms of capitulation were:—The troops to be priſoners of war; but officers, natives, or domiciliated, to be at liberty to remain in the country, or proceed to Great Britain on their parole, not to ſerve till exchanged. All property belonging to individuals, or to public inſtitutions, to be unmoleſted; the inhabitants to preſerve their rights, liberties, and religion, with the exerciſe of their legal functions; but all public property to be delivered up to the captors.—In this whole ſervice, only one man was killed, twelve wounded, and one miſſing.

Unfortunately, in no great time after the event of this ſucceſsful expedition, the military and inhabitants of Buenos Ayres, amounting to about 12,000 men, having organized themſelves into a military body, attacked the force under major-general Beresford, conſiſting of about 1450 men, on the 10th, 11th, and 12th, days of Auguſt. The actions fought on theſe days were bravely and obſtinately conteſted; the Spaniards fought approaching to a ſtate of fury; many of our brave men were killed and beat down by ſuperior numbers at the muzzle of their guns. This glorious defence was attended with the loſs on our part of 144 men and officers killed and wounded, and of 1300 men taken priſoners and detained, general Beresford was detained; captain Kennet of the engineers, and lieutenants Mitchell and Lucas of the 71ſt regiment, were killed. The Spaniards loſt about ſix hundred men. The inhabitants of Buenos Ayres are computed at ſeventy thouſand perſons; many of theſe fired from the tops of their houſes upon our troops as they were marching out of the town. The diſhonourable conduct of the governor of Buenos Ayres, in detaining our troops, and marching them into the interior of the country, after he had ſigned the articles of capitulation, by which they were to embark on-board of tranſports for Europe or the Cape, is a new diſgrace to their nation.

ARTICLES OF CAPITULATION.

Fort Buenos Ayres, 12th Auguſt, 1806.

The Britiſh general, having no further object for remaining in Buenos Ayres, and to avoid an unneceſſary effuſion of blood, as alſo the deſtruction of the property of the inhabitants of this city, conſents to deliver up the fort of Buenos Ayres to the commander of his catholic majeſty's forces, on the following conditions:

1. The Britiſh troops to march out with all the honours of war, to be conſidered as priſoners of war; but to be embarked as ſoon as poſſible on-board the Britiſh tranſports now in the river, to be conveyed to England, or the ſtation whence they came.

2. The Britiſh, on their entrance into this place, made many Spaniſh priſoners of war, which remained on their parole; and, as the number of officers is much greater on one ſide, and of men on the other, it is agreed that the whole ſhall be exchanged for the whole; the Engliſh tranſports returning to the place of their deſtination as cartels, and to be guaranteed as ſuch by the Spaniſh government from capture on the voyage.

3. Proviſions, &c. will be furniſhed for the paſſage of the Engliſh troops, according to the uſual cuſtom in like caſes.

4. Such wounded of the Britiſh troops as cannot be removed on-board of ſhips, ſhall remain in the hoſpitals at Buenos Ayres, either under charge of Spaniſh or Britiſh ſurgeons, at the option of the Britiſh general, and ſhall be furniſhed with every thing neceſſary, and on their recovery ſent to Great Britain.

5. The property of all Engliſh ſubjects in Buenos Ayres to be reſpected.

W. C. BERESFORD,
SANTIAGO CONSIDIDO LINIERS.

The Britiſh ſhips now dropped down the river, except the Juſtinia, bound to Botany-bay, which having ſailed from St. Helena under the protection of ſir Home Popham's ſquadron, had come to anchor ſo high up the river Plata, that ſhe was taken. On the 2d of October, a reinforcement of between two and three thouſand men arrived from the Cape of Good Hope, conſiſting of the 38th and 47th regiments, and three hundred and fifty of the 21ſt dragoons. On the 28th of that month, an attack was made on Monte Video. It however ſoon appeared, that the men of war could not enter near enough to bombard the town, with ſufficient effect to cover the landing of the troops, although they ſucceeded in ſilencing the batteries; therefore the attack was given up. The troops were taken to Maldonado, a ſtrong poſt near the mouth of La Plata, rendered impregnable by nature; the iſland of Gotiti, which is ſtrongly fortified by art, protects it. On this peninſula our troops were ſecurely and comfortably ſituated; the men of war flanking them on each ſide. The Spaniards, ſoon after they landed there, meditated an attack on them; but they were ſo convinced of their ſecure ſituation, that the Spaniſh troops refuſed to march againſt them. The enemy ſuffered a loſs of about ſixty perſons killed and wounded at the bombardment of Monte Video; but we had none either killed or wounded.

On the 5th of January 1807, a further ſupply of troops, under brigadier-general Auchmuty, arrived at Maldonado from England, with the Ardent man-of-war and tranſports, under rear-admiral Stirling; ſir Home Popham having been re-called, to take his trial for having

ing failed upon the expedition againſt Buenos Ayres, without the *expreſs* orders of the government: he was brought to trial on Friday, March 6, 1807, on-board the Gladiator, at Portſmouth. The following is the ſubſtance of the charge made againſt him by the lords of the admiralty.—"Whereas, by our order, dated 29th July 1805, ſir Home Popham, then captain of his majeſty's ſhip Diadem, was directed to take under his command his majeſty's ſhips Belliqueux, Raiſonable, Diomede, Narciſſus, and Leda, the Eſpoir ſloop, and Encounter gun-brig, for the purpoſe of capturing the enemy's ſettlements at the Cape of Good Hope, in conjunction with the troops under the command of major-general ſir David Baird, which ſettlement was ſurrendered to the ſhips and troops afore-mentioned, in the month of January 1806; and whereas, it appears by letters from the ſaid ſir Home Popham to our ſecretary, dated the 13th and 30th April following, that, with the view to attack the Spaniſh ſettlements in the Rio de la Plata, *for which attack he had no direction or authority whatever*, he did withdraw from the Cape the whole of the naval force, which had been placed under his command for the ſole purpoſe of protecting it, thereby leaving the Cape, which it was his duty to guard, not only expoſed to attack and inſult, but even without the means of affording protection to the trade of his majeſty's ſubjects, or of taking poſſeſſion of any ſhips of the enemy which might have put into any of the bays or harbours of the Cape, or parts adjacent; all which he, the ſaid ſir Home Popham, did, notwithſtanding that he had received previous information of detachments of the enemy's ſhips being at ſea, and in the neighbourhood of the Cape; and notwithſtanding he had been apprized that a French ſquadron was expected at the Mauritius, of which he informed us by his letter to our ſecretary, dated the 9th of April, 1806, only four days prior to his departure from the Cape for the Rio de la Plata."—The trial did not excite much intereſt. Many people thought it ill-judged to bring a man to trial who had done ſome good to his country. Sir Home's defence was very long, but moſtly irrelevant, conſiſting of political reflections and declamation, more likely to recommend him to the favour of the miniſtry which has ſince been formed than to that then exiſting, or to the court aſſembled. But the fact of having acted without authority could not be got over; he was therefore found guilty, but his only puniſhment was a *ſevere reprimand*.

General Auchmuty and admiral Stirling renewed the attack upon Monte Video. They landed the troops on the 18th of January, from a ſmall bay about nine miles from the city; and on the 19th they were oppoſed on their march by four thouſand of the enemy's horſe, which were driven back and diſperſed. But on the 20th the Spaniards marched out with nearly their whole force, amounting to about ſix thouſand men, when an action commenced in which a great number fell on both ſides. At length the Spaniards gave way, when they were impetuouſly attacked in flank by the rifle corps and light infantry, and the ſuburbs were ſeized by the Engliſh. On the 25th batteries were opened againſt the citadel, and all the frigates and ſmaller veſſels were anchored as cloſe as could be done with ſafety, to cannonade the town. On the 2d of February a practicable breach was made near the ſouth gate, which joins the works to the ſea. Orders were iſſued to begin the aſſault an hour before day-break the next morning, and ſtorm the city.

The troops deſtined for the aſſault conſiſted of the rifle corps under major Gardner, the light infantry under lieutenant-colonel Brownrigg and major Trotter, the grenadiers under majors Campbell and Tucker, and the 38th regiment under lieutenant-colonel Vaſſal and major Nugent. They were ſupported by the 40th regiment under major Dalrymple, and the 87th under lieutenant-colonel Butler and major Miller. The whole were commanded by colonel Browne. The remainder of the troops, conſiſting of the 17th light dragoons, detachments of the 20th and 21ſt light dragoons, the 47th regiment, a company of the 71ſt, and a corps of ſeven hundred marines and ſeamen, were encamped under brigadier-general Lumley, to protect our rear. At the appointed hour the troops marched to the aſſault. They approached near the breach before they were diſcovered, when a deſtructive fire from every gun that could bear upon it, and from the muſketry of the garriſon, opened upon them. Heavy as it was, our loſs would have been comparatively trifling, if the breach had been open; but during the night the enemy had barricadoed it with hides, ſo as to render it nearly impracticable. The night was extremely dark. The head of the column miſſed the breach, and when it was approached it was ſo ſhut up, that it was miſtaken for the untouched wall. In this ſituation the troops remained under a heavy fire for a quarter of an hour, when the breach was diſcerned by captain Renny of the 40th light infantry, who pointed it out, and gloriouſly fell as he mounted it. Our gallant ſoldiers ruſhed to it, and, difficult as it was of acceſs, forced their way into the town. Cannon were placed at the head of the principal ſtreets, and their fire, for a ſhort time, was deſtructive; but the troops advanced in all directions, clearing the ſtreet and batteries with their bayonets, and overturning their cannon. The 40th regiment, with colonel Browne, followed. They alſo miſſed the breach, and twice paſſed through the fire of the batteries, before they found it. The 87th regiment was poſted near the North gate, which the troops who entered at the breach were to open for them, but their ardour was ſo great that they could not wait. They ſcaled the walls and entered the town as the troops within approached it. At day-light every thing was in our poſſeſſion except the citadel, which made a ſhow of reſiſtance, but ſoon ſurrendered, and early in the morning the town was quiet, and the women were peaceably walking the ſtreets.

During the ſiege the loſs of the Engliſh was trifling; but it was dreadful at the aſſault. Many moſt valuable officers were among the killed and wounded. The enemy's loſs was very great, about eight hundred killed, five hundred wounded, and the governor Don Paſquil Ruis Huidobro, with upwards of two thouſand officers and men, were made priſoners. About fifteen hundred contrived to eſcape in boats.—The following is the total of our killed and wounded in this ſervice: 1 major, 4 captains, 8 lieutenants, 2 ſerjeants, 6 drummers, 126 rank and file, killed; 2 lieutenant-colonels, 2 majors, 6 captains, 10 lieutenants, 5 enſigns, 4 ſtaff, 20 ſerjeants, 6 drummers, 366 rank and file, wounded; 8 rank and file miſſing.

Fifty-ſeven veſſels of different deſcriptions were taken in the harbour of Monte Video, among which were ſeveral frigates, and a number of veſſels laden with the produce of the country; alſo 15 ſloop-rigged gun boats and 6 row boats with guns.

The ſucceſs with which the Britiſh forces were employed, both by ſea and land, during the year 1806, is highly deſerving of our admiration; and the new year 1807 was uſhered in with the complete conqueſt of the rich and valuable iſland of Curaçoa, a ſettlement belonging to the Dutch, in the Weſt Indies.—See the article CURAÇOA, vol. v. p. 477.—This brilliant atchievement was performed by captain Briſbane, with a ſquadron of only four frigates, viz. the Arethuſa, Latona, Anſon, and Fiſguard. The harbour was defended by regular fortifications of two tier of guns; Fort Amſterdam alone conſiſting of ſixty-ſix pieces of cannon; the entrance only fifty yards wide, athwart which was the Dutch frigate Hatſlar of thirty-ſix guns, and Surinam of twenty-two, with two large ſchooners of war, one commanded by a Dutch commander; a chain of forts

was on Miſelburgh commanding height; and that almoſt impregnable fortreſs, Fort Republique, within the diſtance of grape-ſhot, enfilading the whole harbour. At a quarter paſt ſix in the morning, captain Briſbane, in the Arethuſa, advanced with his ſquadron cloſely drawn up into the port; a ſevere and deſtructive cannonade enſued; the frigate, ſloop, and ſchooners, were carried by boarding; the lower forts, the citadel and town of Amſterdam, by ſtorm; all of which, by ſeven o'clock, were in our poſſeſſion; and at ten o'clock, the Britiſh flag was hoiſted on Fort Republique. The Dutch priſoners were to be conveyed to a port in Holland; and on the 5th of January the inhabitants of Curaçoa took the oath of allegiance to the king of Great Britain.

While theſe ſucceſsful operations were going on in the Weſt-Indies, a ſecret expedition was ſent out to Egypt. On the memorable 21ſt of March, the very day ſix years in which the French were routed at Alexandria, major-general Fraſer, at the head of another Engliſh army, again took poſſeſſion of that noble city, in the name of his Britannic majeſty. Very little reſiſtance was made; and after a ſlight affair, in which ſeven of our men were killed and ten wounded, the governor agreed to articles of capitulation, by which the Turkiſh ſoldiers were to be ſent to ſome port in Turkey, and all private property was protected. Two fine Turkiſh frigates, and a corvette, were taken in the harbour. The inhabitants of Alexandria appeared highly pleaſed at the return of the Engliſh, and ſhewed them every civility. Yet this flattering circumſtance was perhaps the means of lulling the Engliſh into a fatal ſecurity. General Fraſer, with a view to ſecure proviſions for Alexandria, ordered a corps commanded by major-general Wauchope, to attack, and obtain poſſeſſion of, Roſetta. General Wauchope accordingly proceeded thither, with about fifteen hundred men; and having taken the heights above the town, without loſs, attempted to enter the place, without having taken the neceſſary precautions. Upon his entering the town, he was aſſailed by a ſevere fire from the roofs and windows of the houſes; and after a ſharp conflict, the Britiſh troops were obliged to retire, with the loſs of nearly three hundred men, killed and wounded. General Wauchope himſelf was killed, and brigadier-general Meade wounded. As, however, the poſſeſſion of Roſetta was neceſſary for facilitating the required ſupplies of proviſions for Alexandria, a ſecond attack was determined upon; and for this purpoſe, a diviſion of two thouſand five hundred men, under the orders of general Stewart, was ſent from Alexandria by general Fraſer. In the mean time a force of Albanians had marched from Cairo to Roſetta. Between theſe and the Britiſh diviſion a battle took place in the neighbourhood of that town. The conflict was ſanguinary, but moſt unequal. The vaſt ſuperiority of the enemy ultimately prevailed, and the Engliſh were again forced to retire, with the additional loſs of upwards of one thouſand men, killed and wounded. Among the officers wounded were colonel M'Leod, major Mohr, and major Fogelſang. The reſt of the diviſion were obliged to retreat to Alexandria.—Here the above obſervation relative to the impolicy of waſting our ſtrength in diſtant and disjoined operations, cannot but ſtrike every thinking mind.

To compenſate in ſome meaſure this misfortune, a ſquadron under the command of ſir Edward Pellew effected the deſtruction of the whole of the Dutch marine in the harbour of Batavia, amounting to twenty-ſix veſſels. The epocha of theſe events was marked by a change of the adminiſtration in England, and the calling of a new parliament.

The offenſive operations of Great Britain have been as much as poſſible directed towards the ſupport of our allies; in the proſecution of which, it is pretty evident, from the prodigious reſources of national ſtrength and treaſure, of occaſional aids by land, and perpetual victories at ſea, that the interpoſition and influence of Great Britain ſtill keeps the balance of power from any fatal preponderance, and has probably been the means of preſerving the four quarters of the globe from the inſatiate graſp of France.—For the political relations of Great Britain to other countries, and the principal events of peace and war, ſee the articles ENGLAND, FRANCE, GERMANY, HOLLAND, PRUSSIA, RUSSIA, TURKEY, &c.

With reſpect to the principal ſources of the wealth and proſperity of Great Britain, as theſe are chiefly drawn from her commerce and extenſive manufactures, a brief ſtatement of them here cannot prove unacceptable. The wool-trade ought ſtill to be conſidered as the grand ſtaple of the country. In a recent examination of the principal woollen manufactures of Great Britain, by a committee of the houſe of commons, the quantity of wool grown in this country was eſtimated at 600,000 packs of 240lbs. each, which, valued at 11l. per pack, amount to 6,600,000l. and, though the increaſe of value of manufactured wool is various, and depends on its quality, yet it was ſtated, that the total value of the wool manufacture in this country amounts to 19,800,000l. But this calculation was formed upon an unuſually high price of wool. We ſhall come nearer the truth if we form the calculation on 500,000 packs, at 10l. 10s. per pack; and thus the value of the wool will be 5,250,000l. and its manufactured value will be 15,750,000l. The average value of woollen goods exported for 1797, 1798, and 1799, is 6,104,211l. which, as the cuſtom-houſe values of goods exported are much below their real value, requires an addition of about twenty-five per cent. and thus it becomes 7,630,263l. The value of goods retained for home conſumption will be nearly equal to that of ſuch as are exported; and, therefore, the whole value of the manufacture appears to be about 15,260,000l. and may be taken, at a medium, between this ſum and that before ſtated, at 15,500,000l. Deducting 10 per cent. on the coſt of goods, for the profits of the manufacturer, with intereſt of his capital, there will remain 14,090,909l. for the coſt of materials and wages of labour: and as the value of the wool is about 5,250,000l. the amount of workmanſhip, or the wages of all the perſons employed in this manufacture, is 8,840,909l. and the whole number of perſons employed, averaging their wages at eight ſhillings each per week, does not exceed 425,043.

The value of the leather manufacture may be ſtated at 10,500,000l. from which deducting 954,545l. for the profits of the capital, and 3,500,000l. for the coſt of the raw hides, there will remain 6,045,455l. for the wages of perſons employed in it, which, allowing to each 25l. a year at an average, makes the number employed 241,818.

The cotton manufacture was formerly inconſiderable, in compariſon with its preſent ſtate. The total quantity of cotton wool imported into England, on an average of five years, ending with 1705, was 1,170,881lbs. and ſo late as the year 1781, it amounted to only 5,101,920lbs. But this manufacture has been ſo much extended, that before the commencement of the war the conſumption of cotton wool amounted to upwards of 30,000,000lbs. per annum. During the years 1796, 1797, 1798, and 1799, the annual import, at an average, was 30,434,000lbs. the value of which, when manufactured, cannot be leſs than 9,500,000l. and if we deduct from this ſum 863,636l. for profits of capital, at 10 per cent. and 3,804,250l. for coſt of the raw material at 2s. 6d. per pound, there will remain 4,832,114l. for wages, which, divided at the rate of 15l. per annum for each perſon, on account of the number of women and children employed, makes the whole number 322,140 perſons.

The ſilk manufacture has of late years experienced little fluctuation; the average of raw and thrown ſilk imported for three years preceding the 5th of January,

1797,

1797, was 883,438lbs. and the uſual quantity cannot be ſtated at leſs than 900,000lbs. the value of which, when manufactured, is about 2,700,000l. The coſt of the ſilk, averaging that of the raw and thrown at 28s. per pound, amounts to 1,260,000l. and the profits of the manufacturer to 245,454l. at the rate of 10 per cent. on the coſt when manufactured. The number of perſons employed in this manufacture has been ſtated at 200,000 and upwards; but there is reaſon, ſays Mr. Grellier, to believe that it does not exceed 60,000 of all deſcriptions.

The linen manufacture of Great Britain is chiefly confined to Scotland, though conſiderable branches of it are carried on in Manchester and other parts of England. The total quantity of Britiſh linen exported during the years 1797, 1798, 1799, was 56,481,000 yards; and if the quantity retained for home conſumption is not greater than the export, the value of the whole muſt be at leaſt 1,600,000l. and that this does not exceed the truth is probable, if the yearly value of the whole manufacture in Great Britain, with the thread and other branches of the flax trade, is ſtated at 2,000,000l. and the number of perſons employed at 60,000. The hemp manufacture at preſent exceeds 1,500,000l. but it is leſs in time of peace; and the number of perſons employed is probably not leſs than 35,000.

The paper manufacture has of late greatly advanced. About one hundred years ago, the paper made in this country was almoſt wholly the coarſe wrapping paper, and for a long time the ſuperior kinds were imported; but the export is now conſiderable. The annual value of the manufacture, at the preſent high prices of the article, cannot be leſs than 900,000l. and the number of perſons employed is 30,000.

The glaſs manufacture has of late very much improved and increaſed; ſo that it may now amount to 1,500,000l. and the perſons employed in it are about 36,000. The potteries and manufactures of porcelain have alſo rapidly advanced during the preſent century, in conſequence of the improvement they have received, and the introduction of many new and beautiful wares both for our own uſe and foreign markets. This country is particularly indebted to Mr. Wedgwood, "for converting clay into gold." The annual value will probably not be over-rated at 2,000,000l. and the number of perſons employed at 45,000.

The iron manufacture is ſupplied partly by the produce of our own mines, and partly by thoſe of other countries. With reſpect to the firſt, it is ſaid the total produce of pig-iron in Britain does not at preſent exceed 100,000 tons; and reckoning on an average, that 33 cwt. of crude iron produces one ton of bars, and that the manufacture of malleable iron amounts to 35,000 tons per annum, this branch will require 57,750 tons of crude iron; and the value in bars at 20l. a ton is 700,000l. the remaining 42,250 tons, caſt into cannon, cylinders, machinery, &c. at 14l. a ton, is worth 591,500l. The ſupply of foreign bar-iron is chiefly obtained from Ruſſia and Sweden; and the quantity imported, on an average of twelve years, has been 44,135 tons, worth, at 22l. per ton, 970,970l. which, together with the former ſums, amounts to 2,262,470l. Some years ago, the value of the iron manufacture was eſtimated at 8,700,000l. but if this ſum ſhould appear too high, we may include tin and lead, and the value of the whole will probably amount to 10,000,000l. and the number of perſons employed to 200,000.

The copper and braſs manufactures are now eſtabliſhed in conſiderable perfection. Till about the years 1720 or 1730, moſt of the copper and braſs utenſils uſed for culinary and other purpoſes in this country were imported from Hamburg and Holland, being procured from the manufactories of Germany: and even ſo late as 1745 and 1750, copper tea-kettles, ſaucepans, and pots of all ſizes, were imported in large quantities. But by the perſevering induſtry and enterpriſing ſpirit of our miners and manufacturers, theſe imports have become totally unneceſſary; ſo that the articles are now all made here, and far better than any other country can produce. The diſcovery of new copper-mines in Derbyſhire and Wales, in 1773, contributed to the extenſion of the manufacture in this country; and it appears to be ſtill increaſing, notwithſtanding the late great advance in the price of copper. The value of wrought copper and braſs, exported during the year 1799, was 1,222,187l. and there is reaſon to believe, that the whole value of theſe manufactures at preſent is at leaſt 3,500,000l. and the number of perſons employed 60,000l.

The ſteel, plating, and hard-ware, manufactures, including the toy-trade, have been of late much extended, and may probably amount in value to 4,000,000l. and the perſons employed to at leaſt 70,000.—Though theſe eſtimates muſt in ſome meaſure be defective, from the want of more authentic documents, they may nevertheleſs ſerve to ſhew the relative extent of our principal manufactures, as in the following ſummary:

	Annual Value.	Perſons employed.
Woollen	£15,500,000	425,043
Leather	10,500,000	241,818
Cotton	9,500,000	322,140
Silk	2,700,000	60,000
Linen and Flax	2,000,000	60,000
Hemp	1,500,000	35,000
Paper	900,000	30,000
Glaſs	1,500,000	36,000
Potteries	2,000,000	45,000
Iron, tin, and lead	10,000,000	200,000
Copper and braſs	3,500,000	60,000
Steel, plating, &c.	4,000,000	70,000
	£63,600,000	1,585,000

Though theſe manufactures are principally carried on through the medium of paper currency, this in reality takes nothing from the genuine riches of the country, nor contributes, in the ſlighteſt degree, to the enhancement of the prices of proviſions. It may be prudent, however, to limit the total amount of paper iſſued, and to reſort for this purpoſe, whenever the temptation to borrow is too ſtrong, to ſome effectual principle of reſtriction; in no caſe, however, materially to diminiſh the ſum in circulation, but to let it vibrate only within certain limits; to afford a ſlow and cautious extenſion of it, as the general trade of the kingdom enlarges itſelf; to allow of ſome ſpecial, though temporary, increaſe in the event of any extraordinary alarm or difficulty, as the beſt means of preventing a great demand at home for guineas; and to lean to the ſide of diminution, in the caſe of gold going abroad, and of the general exchanges continuing long unfavourable; this ſeems to be the true policy of the directors of an inſtitution circumſtanced like that of the Bank of England. To ſuffer either the ſolicitations of merchants, or the wiſhes of government, to determine the meaſure of the bank iſſues, is unqueſtionably to adopt a very dangerous principle. See BANK OF ENGLAND, vol. ii. p. 672.

That the popular opinion which has been entertained of the great influence of paper credit in raiſing the price not only of commodities in general, but of proviſions in particular, is without foundation, admits of an eaſy proof:—By the account which the Bank rendered to parliament, it appears, that the amount of Bank of England notes was, on the 25th of February, 1795, 13,539,160l. In the three months immediately following the 25th of February, 1795, the average price of wheat, in the London corn-market, was about 57s. per quarter.—By the ſame Bank account, it appears, that the amount of Bank of England notes was, on the 25th of February, 1796, 11,030,116l. In the three months immediately

immediately following the 25th of February, 1796, the average price of wheat, in the London corn-market, was about 94s. per quarter.—Thus wheat bore a comparatively low price when the amount of Bank notes in circulation was greater; and a comparatively high price when their amount was ſmaller. It bore the moderate price 57s. per quarter, at a time when the amount of Bank of England notes was very conſiderable; and in 1803, when the total iſſue of Bank notes amounted to the prodigious ſum of 17,931,930l. the price of bread-corn experienced no advance.

The commerce of Great Britain extends through the eaſtern and weſtern hemiſpheres of the globe, by means of the capital and credit of the country, the ſkill and induſtry of its artizans and manufacturers, the number of its ſhips and the character of its ſeamen, and the enterpriſing ſpirit as well as eſtabliſhed reputation of its merchants. The number of regiſtered veſſels belonging to the Britiſh dominions, and employed in trade, in 1802, was 20,568, their tonnage 2,128,055, and the number of ſeamen navigating the ſame, 154,530. In 1803, the number of veſſels was 21,445; their tonnage 2,238,249; and the number of men 155,445; being an increaſe of 877 ſhips, of 110,194 tons, and of 915 men.—For particulars of the annual amount of Exports and Imports; value of the Landed Property or Rental of Great Britain; general amount of Taxes, or public Income and Expenditure; the military and maritime ſtate of the country, laws, religion, cuſtoms, manners, &c. ſee the article ENGLAND, vol. vi. p. 796–808; and for the principles of its GLORIOUS CONSTITUTION, ſee the article GOVERNMENT, in this volume.

GREAT FAM'INE, a river of North America, which riſes in the mountains near the ſource of Oneida river, and flows north-weſt-by-weſt to Lake Ontario. Its mouth is ten miles ſouth-weſterly from the mouth of Black River.

GREAT HARE, *ſ.* With hunters, a hare in the third year of her age.

GREAT HOUSE, *ſ.* A cant term among country folks for the principal houſe in the pariſh:

That, will he, nill he, to the *great houſe*
He went, as if the devil drove him. *Gray's Long Story.*

GREAT I'SLAND, an iſland of Ireland, ſituated in the river Lee; five miles long, and from one to three wide: eight miles eaſt of Cork.

GREAT KAN'HAWAY, a river of North America, which flows through the eaſtern bank of the Ohio, in lat. 39. 5. N. nearly five hundred yards wide at its mouth. The current is gentle for about twelve miles, when it becomes conſiderably rapid for upwards of ſixty miles farther, where commence the firſt falls, when it becomes impoſſible to navigate it from the great number of its cataracts.

GREAT RIDGE, one of the ridges of the Alleghany Mountains, in North America, which ſeparate the waters of the Savannah and Alatamaha. At the ſouth-eaſt promontory of the Great Ridge is that extraordinary place called Buffaloe Lick, diſtant about eighty miles from Auguſta. It occupies ſeveral acres of ground. A large cane ſwamp and meadows, forming an immenſe plain, lie ſouth-eaſt from it; in this ſwamp Mr. Bartram thinks the branches of the Great Ogeechee take their riſe. The Lick is nearly level, and lies between the head of the cane ſwamp and the aſcent of the Ridge. The earth, from the ſuperficies to an unknown depth, is an almoſt white or cinereous coloured, tenacious, fattiſh, clay, which all kinds of cattle lick into great caves, purſuing the delicious vein. Mr. Bartram could not diſcover any thing ſaline in its taſte, but an inſipid ſweetneſs. Horned cattle, horſes, and deer, are immoderately fond of it; inſomuch that their excrement, which almoſt totally covers the earth to ſome diſtance round this place, appears to be perfect clay; which when dried by the ſun and air, is almoſt as hard as brick.

GREAT SI'ZED, *adj.* Of a great ſize:

Thou *great-ſized* coward,
No ſpace of earth ſhall ſunder our two hates. *Shakeſpeare.*

GREAT SPRINGS, is an amazing fountain of tranſparent cool water, ſituated near the road, about midway between Auguſta and Savannah, in North America. It breaks ſuddenly out of the earth at the baſis of a moderately elevated hill or bank, forming at once a baſon near twenty yards over, aſcending through a horizontal bed of ſoft rocks, chiefly a teſtaceous concretion of broken, entire, and pulverized, ſea-ſhells, ſand, &c. conſtituting a coarſe kind of lime-ſtone. The ebullition is copious, active, and continual, over the ragged apertures in the rocks, which lie ſeven or eight feet below, ſwelling the ſurface conſiderably, immediately above it; the waters deſcend ſwiftly from the fountain, forming at once a large brook, ſix or eight yards over, and five or ſix feet deep. There are multitudes of fiſh in the fountain of various tribes; chiefly the ſeveral ſpecies of bream, trout, cat-fiſh, and garr, which are beheld continually aſcending and deſcending through the rocky apertures. Bartram, from whoſe travels the above is taken, obſerves, that he croſſed no ſtream or brook of water within twelve or fifteen miles of this fountain, but had in view vaſt ſavannahs, ſwamps, and cane-meadows, which he conjectures are the reſervoirs which feed this delightful grotto.

To GREAT'EN, *v. a.* To aggrandize; to enlarge; to magnify. *A word little uſed.*—A favourite's buſineſs is to pleaſe his king; a miniſter's to *greaten* and exalt him. *Ken.*

GREAT'LY, *adv.* In a great degree.—Thy ſorrow I will *greatly* multiply. *Milton.*—Nobly; illuſtriouſly:

Yet London, empreſs of the northern clime,
By an high fate thou *greatly* didſt expire. *Dryden.*

Magnanimouſly; generouſly; bravely:

Where are theſe bold intrepid ſons of war,
That *greatly* turn their backs upon the foe,
And to their general ſend a brave defiance. *Addiſon.*

GREAT'MAN's BAY, a bay of Ireland, on the north coaſt of Galway Bay: ſix miles north from the South Arran Iſlands.

GREAT'NESS, *ſ.* Largeneſs of quantity or number. Comparative quantity.—We can have no poſitive idea of any ſpace or duration, which is not made up of and commenſurate to repeated numbers of feet or yards, or days or years, and whereby we judge of the *greatneſs* of theſe ſort of quantities. *Locke.*—High degree of any quality.—Zeal in duties ſhould be proportioned to the *greatneſs* of the reward and the certainty. *Rogers.*—High place; dignity; power; influence; empire.—Farewell, a long farewell, to all my *greatneſs*. *Shakeſpeare.*

Approaching *greatneſs* met him with her charms
Of pow'r and future ſtate;
He ſhook her from his arms. *Dryden.*

Swelling pride; affected ſtate.—My lord would have you know, that it is not of pride or *greatneſs* that he cometh not aboard your ſhips. *Bacon.*—Merit; magnanimity; nobleneſs of mind:

Greatneſs of mind and nobleneſs their ſeat
Build in her loveliеſt. *Milton.*

Grandeur; ſtate; magnificence:

Greatneſs with Timon dwells in ſuch a draught,
As brings all Brobdignag before your thought. *Pope.*

GREAVE, *ſ.* [ȝnæp, Sax.] A grove:

Yet, when ſhe fled into that covert *greave*,
He, her not finding, both them thus nigh dead did leave. *Spenſer.*

GREAVES, *f.* [from *greves*, Fr.] Armour for the legs; a ſort of boots. It wants the ſingular number.—He had *greaves* of braſs upon his legs. 1 *Sam.* xvii.

A ſhield make for him, and a helm, fair *greaves*, and curets ſuch
As may renown thy workmanſhip, and honour him as much. *Chapman.*

The refuſe or dregs of a ſoap-boiler's copper; now diſcovered to be a rich and valuable manure.

GREAVES (John), an eminent Engliſh mathematician and antiquary, born at Colmore, in Hampſhire, in 1602. His claſſical education he received under the inſtructions of his father, who was rector of that pariſh. When fifteen years of age, he was ſent to Baliol college, Oxford, where he applied with great aſſiduity to his academic ſtudies, and commenced bachelor of arts in 1621. Three years after this he ſtood candidate for a fellowſhip of Merton college, when he was the firſt on the liſt of five who were then elected; on which occaſion he diſcovered an uncommon proficiency in claſſical literature, and alſo in philoſophy. In 1628 he took his degree of maſter of arts; upon which he more particularly directed his attention to the ſtudy of the mathematics and oriental learning, and made himſelf familiar with the ancient Greek, Arabian, and Perſian authors. In 1630 he was elected profeſſor of geometry in Greſham college; but Mr. Greaves rather choſe to travel abroad for farther improvement. Accordingly, in 1635, he went to Holland, and, after he had attended for ſome time on the lectures of the celebrated James Golius, profeſſor of Arabic at Leyden, he proceeded thence to Paris, where he conferred with the learned Claudius Hardy on the ſubject of Perſian literature. From Paris he extended his tour to Rome, in order to view the antiquities of that city; whence he afterwards went to Florence, Padua, and other parts of Italy. During this tour, he had very advantageous offers from the earl of Arundel, then in Italy, to accompany him on his travels into Greece; but he had come to a determination to take a voyage into Egypt, which obliged him to return to England, to make the neceſſary preparations for viſiting that country. As it was his deſign not only to make himſelf acquainted with ſuch remains of antiquity in Egypt as are intereſting to curioſity, and ſerve to illuſtrate ancient literature, but alſo to make aſtronomical and geographical obſervations, he furniſhed himſelf with inſtruments of every kind proper for that purpoſe.

Mr. Greaves embarked in 1637 for Leghorn, accompanied by his friend Mr. Edward Pococke, and after a ſhort ſtay in Italy, arrived at Conſtantinople in the ſame year. Here he was received with great kindneſs by the Engliſh ambaſſador ſir Peter Wyche, and became acquainted with the venerable Cyril Lucar, the Greek patriarch, who afforded him much aſſiſtance in purchaſing Greek manuſcripts. Mr. Greaves's ſtay at Conſtantinople was prolonged by his anxiety for the improvement of aſtronomical ſcience. Knowing that within a few months there would be a large viſible eclipſe of the moon, he furniſhed proper perſons with convenient inſtruments for obſerving it at Conſtantinople, Bagdat, Smyrna, and Alexandria, and alſo gave them the neceſſary inſtructions for that purpoſe. Dr. Halley obſerves, that a greater ſervice could not be rendered to the ſcience of aſtronomy, than by taking the phaſes of the moon's eclipſes at thoſe places, in order to determine their longitudes. Mr. Greaves having effected this buſineſs, he took leave of his fellow-traveller Mr. Pococke, and embraced an opportunity which offered of paſſing in company with the annual Turkiſh fleet to Alexandria, where, after touching at Rhodes, he arrived in September 1638. He had now reached the ſcene which opened a large field for the exerciſe of his curious and inquiſitive genius. Nor did he omit any opportunity of remarking whatever ſeemed any way uſeful and worthy of notice; and for the extenſion of his enquiries he went twice from Alexandria to Grand Cairo, and from thence explored the deſerts. Having thus highly gratified his curioſity, furniſhed his mind with a large ſtock of uſeful knowledge, and collected ſome Greek, Arabic, and Perſian, manuſcripts, as well as ancient coins, and other rarities, he embarked at Alexandria in April 1639, and arrived at Leghorn in June following. He now ſpent nine months in making a ſecond tour of Italy, in order again to view the principal remains of ancient art, and to examine more accurately into the true ſtate of the Roman weights and meaſures. At Florence he was received with particular marks of reſpect by the grand-duke of Tuſcany, Ferdinand II. to whom he had addreſſed a Latin poem ſent from Alexandria; and he alſo was permitted free acceſs to the Medicean library, which had been refuſed to him as a ſtranger when on his former tour. From Florence he went to Rome; whence he returned to Leghorn, and embarked on-board a veſſel for London, with a rich cargo of manuſcripts, gems, coins, and other valuable antiquities.

Upon his arrival in his native country in 1640, Mr. Greaves found the kingdom diſtracted by the conteſts between the king and the parliament, and he joined the party which ſupported the king and the epiſcopal conſtitution. Having made a ſhort ſtay at Greſham-college, he went to Oxford, in order to digeſt his papers, and to prepare for public inſpection ſuch as might be uſeful to the world. In this deſign he was aſſiſted by archbiſhop Uſher, who had long known and eſteemed him; and he now drew a map of the Leſſer Aſia, at his grace's requeſt, who was writing his diſſertation on that country, which was printed in 1641. In that year, archbiſhop Laud having preſented a ſecond collection of medals to the univerſity, the taſk of arranging them was confided to Mr. Greaves, which he performed to the ſatisfaction of that celebrated prelate. He was now choſen Savilian profeſſor of aſtronomy at Oxford, on the death of his friend Dr. Bainbridge, and alſo obtained a royal diſpenſation to hold his fellowſhip at Merton-college, on account of the diminution of his ſtipend as profeſſor, ariſing from the circumſtances of the civil war. As in theſe circumſtances his attention to the duties of his profeſſorſhip was neceſſarily ſuſpended, he proceeded in his labours on his papers; and in 1644 tranſlated into Latin The Lemmata of Archimedes, correcting the diagrams, and ſupplying what was found defective in the demonſtration itſelf. This piece was publiſhed by Samuel Foſter, in his Miſcellanies, or Mathematical Lucubrations, 1659, folio. At the ſame time he had compiled A Perſian Lexicon, out of ſuch words as could be met with in the Evangeliſts, the Pſalms, and two or three Arabian and Perſian nomenclators. In 1645, at the inſtance of ſome perſons of rank and fortune, he drew up a ſcheme for gradually introducing the new or Gregorian ſtyle, by omitting the intercalary days of the leap-year for forty years; which was approved of by the king and council, and would probably have been carried into execution, had the ſtate of the times permitted it. In 1646 he publiſhed *Pyramidographia*, or, a Deſcription of the Pyramids in Egypt, 8vo. which does honour to his accuracy of obſervation; and in the following year he publiſhed his very valuable and learned Diſcourſe on the Roman Foot and Denarius; from whence, as from two Principles, the Meaſures and Weights uſed by the Ancients may be reduced, 8vo. In 1648 he publiſhed *Johannis Bainbriggii Canicularia*; to which he added *Demonſtratio Ortus Syrii heliaci pro Paralleło Inferioris Ægypti*; and alſo, *Inſigniorum aliquot Stellarum Longitudines & Latitudines ex aſtronomicis Obſervationibus Ulug Beigi, Tamerlanis Magni Nepotis*, 8vo.

About this time charges were preferred againſt him by the parliamentary viſitors; among which were accuſations of having betrayed the intereſts of the college, by making a diſcovery to the king's agents of the money that

that was in the treaſury, and of having exerciſed his influence to the prejudice and injury of individual members on account of their adhering to the cauſe of the parliament; and the reſult was his ejectment both from his profeſſorſhip and fellowſhip, and his baniſhment from the univerſity. After his departure, ſome cheſts in which he had packed up his papers, &c. were broken open by the ſoldiers, and his manuſcripts taken out, part of which were loſt, and the reſt recovered by means of his friend Mr. Selden. When Mr. Greaves was aware that it would be impoſſible for him to keep his profeſſorſhip, his regard for the intereſts of ſcience led him to form a plan for introducing a worthy and able ſucceſſor; which he was enabled to accompliſh by means of ſir John Trevor, who procured that appointment for Mr. Seth Ward, afterwards biſhop of Saliſbury. This proved a fortunate circumſtance for Mr. Greaves, as his ſucceſſor had intereſt to procure for him the full arrears of his ſalary, amounting to five hundred pounds. After his baniſhment from Oxford, Mr. Greaves retired to London, where he married, and, living upon his patrimony, devoted his time to literary purſuits. He now publiſhed *Binæ Tabulæ Geographicæ, una Naſſir Eddini Perſæ, altera Ulug Beigi Tartari, Commentariis ex Abulfeda aliiſque Arabum Geographis illuſtratæ*, 1648, 4to. This was followed by *Elementa Linguæ Perſicæ*, 4to. to which the author ſubjoined *Anonymus Perſa de Siglis Arabum & Perſarum Aſtronomicis*. At the ſame time he was engaged, in concert with Mr. William Seaman, author of a Turkiſh Grammar, in preparing a Turkiſh Dictionary; but which was never finiſhed. In 1650 he publiſhed, in quarto, his *Epochæ celebriores, Aſtronomicis, Hiſtoricis, Chronologis, Chataiorum, Syrogræcorum, Arabum, Perſarum, Choraſmiorum, uſitatæ, ex Traditione Ulug Beigi, Arabice & Latine, cum Commentariis*; which were found of ſingular ſervice in correcting a vaſt number of errors in our books of chronology. In the ſame year he produced *Choraſmiæ & Mawaralnahræ, hoc eſt Regionum extra Fluvium Oxum Deſcriptio, ex Tabulis Abulfedæ Iſmaelis Principis Hamah*, 4to. and A Deſcription of the Grand Signior's Seraglio, or Turkiſh Emperor's Court, written by Mr. Robert Withers, 8vo. which had been already printed in Purchas's Pilgrims, of which circumſtance it appears that Mr. Greaves was not appriſed. In 1652 he publiſhed *Aſtronomica quædam ex Traditione Shah Cholgii Perſæ, una cum Hypotheſibus Planetarum: item excerpta quædam ex Alfergani Elementis Aſtronomicis, & Ali Kuſtigii de Terræ Magnitudine & Sphærarum Cœleſtium a Terra Diſtantiis, cum Interpretatione Latina*, 4to. to which he prefixed A ſhort Hiſtory of the Riſe and Progreſs of Aſtronomy among the Arabians, and ſubjoined his *Binæ Tabulæ*, already mentioned. He had prepared ſeveral other works for the preſs, and was meditating more, when he was attacked by a diſorder that proved fatal to him, towards the latter end of the year laſt mentioned, when he was in the fiftieth year of his age. Of his learning, ingenuity, diligence, and perſeverance in any deſign in which he embarked, his works afford abundant evidence. He was much eſteemed by many of the moſt eminent of his contemporaries, both at home and abroad; ſteady in his principles, and in his friendſhips; and his death was deſervedly lamented, as occaſioning a real loſs to the intereſts of literature and uſeful knowledge.

GREBE, *ſ.* in ornithology. See COLYMBUS, vol. iv. p. 840.

GRE'BENSTEIN, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Caſſel: twelve miles north-weſt of Caſſel, and ſixteen north-north-eaſt of Naumberg. Lat. 51. 16. N. lon. 26. 46. E. Ferro.

GRE'BIN, a town of Pruſſia, in Pomerelia: ſix miles ſouth-eaſt of Dantzig.

GRE'CIA, [Latin.] Greece. *Dan.* viii. 21. *Zech.* ix. 13.

GRE'CIAN, *adj.* Belonging to Greece; produced in Greece.

GRE'CIAN, *ſ.* A native of Greece; one ſkilled in the Greek language.

GRE'CISM, *ſ.* [*græciſmus*, Lat.] An idiom of the Greek language.—A violent *Greciſm*, that would ſtartle a Roman at the reading of it, ſounds more natural to us. *Addiſon.*

GRE'COURT (John-Baptiſt Joſeph Villart de), a French poet, born at Tours in 1683. He was brought up to the church, and had a canonry in the church of St. Martin, in his native city, when he was only about fourteen. He firſt made himſelf known as a preacher; but his ſermons were rather ſatirical than moral, and in one of them he is ſaid to have lampooned moſt of the ladies of Tours. Quitting an occupation for which he was ſo little fitted, he became a man of the world, and made his way into company by his convivial talents, and his faculty of writing burleſque and licentious verſes. He was patroniſed by the marſhal duke d'Etrees, who often carried him to his ſeat, which the poet called his earthly paradiſe. He read in company his verſes, which received great advantage from his admirable powers of recitation. His converſation abounded with pleaſant fallies and ſarcaſms, with which he paſſed through a joyous life, which cloſed in 1743. The writings of the abbé Grecourt were Tales, Epigrams, Songs, Fables, and light pieces, not riſing above mediocrity in the poetry, but lively and pleaſant, and often indecent. His poem entitled *Philotanus* had prodigious ſucceſs, which is imputed to its ſubject rather than its merit. It is a ſatirical hiſtory of the bull Unigenitus, in burleſque verſes, ſome of which are extremely humourous.

GRE'DING, a town of Germany, in the circle of Franconia, and biſhopric of Aichſtat: thirteen miles north-eaſt of Aichſtat.

GREE, *ſ.* [*gré*, Fr. probably from *gratia*, Lat.] Good will; favour; good grace:

And falling her before on lowly knee,
To her makes preſent of his ſervice ſeen,
Which ſhe accepts with thanks and goodly *gree*. *Spenſer.*

GREE, *ſ.* in law, ſatisfaction for an offence committed or injury done. And where it is ſaid in our ſtatutes, that judgment ſhall be put in ſuſpence till gree is made to the king of his debt; it is taken for ſatisfaction. Stats. 1 *Rich.* II. c. 15. 25 *Edw.* III. c. 19.

GREECE, *ſ.* [corrupted from *degrees*. It is written likewiſe *greeze* or *grice*.] A flight of ſteps. *Obſolete.*—After the proceſſion, the king himſelf remaining ſeated in the quire, the lord archbiſhop, upon the *greece* of the quire, made a long oration. *Bacon.*

Every *greece* of fortune
Is ſmother'd by that below. *Shakeſpeare.*

GREECE, the moſt celebrated country of Europe, dignified by claſſical writers with the epithets of Mother of the Arts;—the Luminary of Science;—the Fountain of Literature.

Ancient Greece comprehended that country which at preſent conſtitutes the ſouthern part of Turkey in Europe. It was bounded on the eaſt by the Ægean Sea, now called the Archipelago; on the ſouth by the Cretan Sea; on the weſt by the Ionian Sea, or Adriatic Gulf; and on the north by Illyria and Thrace. Its length, from north to ſouth, was about three hundred and fifty miles; and its breadth, at a medium, might be reckoned about two hundred and fifty miles: ſituated nearly in the middle of the northern temperate zone. It may be properly diſtinguiſhed into ſix principal diviſions. Of theſe the moſt northern was *Macedonia*; immediately ſouth of Macedonia lay *Theſſaly*; *Epirus* ſtretched along the coaſt of the Ionian Sea, and was the moſt weſtern diviſion; *Achaia*, or Greece properly ſo called, occupied the middle ſpace: and the moſt ſouthern diviſion was *Peloponneſus*, known at preſent by the name of the *Morea*, which, as the ancient name imports, formed a peninſula,

peninſula, communicating with Achaia by the iſthmus of Corinth, a neck of land about ſix miles broad; the *Iſlands* made the ſixth diviſion.—See the article GEOGRAPHY, p. 376 of this volume, and the correſpondent Map of GRÆCIA ANTIQUA.

The climate of Greece was peculiarly favourable. Equally exempted from the rigorous cold which afflicts the inhabitants nearer to the poles, and from the ſultry heat by which thoſe within the torrid zone are oppreſſed, it abounded with every influence propitious to the human race. The air was ſalubrious, healthful, and uniformly temperate; invigorating without chilneſs, and mild without effeminacy. The ſoil correſponded with the climate. It produced, in extraordinary plenty, not only all the neceſſaries, but likewiſe moſt of the luxuries, of life. The ſoftneſs, purity, and happy temperature, of this climate, muſt, without queſtion, have had a powerful influence upon thoſe who were there born and educated. In fact, no country on earth ever exhibited the human form adorned with more exquiſite beauty, nor the human mind animated with feelings at once more juſt, more delicate, or more benign.

PRIMITIVE HISTORY.

It is extremely to be lamented, that the origin of ſo refined a people, in that remote age of the world, ſhould be involved in ſo much obſcurity and doubt. It may be remarked, in Thucydides's introduction to his hiſtory of the Peloponneſian war, how little correct information could be obtained by that diligent inquirer into the antiquities of his own country. If we admit the common chronology, there is reaſon to believe that the ſcattered fragments of Grecian hiſtory were preſerved during thirteen centuries by oral tradition. The tales or rhapſodies of the ἀοιδοὶ, or bards, were ſucceeded by thoſe of the Cyclic poets, of whom an account is given in Caſaubon ad Athenæum, l. vii. c. 4. Yet the traditions of the Greeks agree with the authentic records of ſacred hiſtory, in repreſenting the countries afterwards known by the names of Thrace, Macedon, and Greece, as peopled at an earlier period than any other portion of the weſtern world. The ſouthern corner of Europe, comprehended between the thirty-ſixth and forty-firſt degrees of latitude, bordering on Epirus and Macedonia towards the north, and on other ſides ſurrounded by the ſea, was inhabited, above eighteen centuries before the Chriſtian era, by many ſmall tribes of hunters and ſhepherds, among whom the Pelaſgi and Hellenes were the moſt numerous and powerful. The barbarous Pelaſgi venerated Inachus as their founder; the humane Hellenes reſpected Deucalion. From his ſon Hellen, they derived their general appellation, which originally denoted a ſmall tribe in Theſſaly; and from Dorus, Æolus, and Ion, his more remote deſcendants, they were diſcriminated by the names of Dorians, Æolians, and Ionians. The Dorians took poſſeſſion of that mountainous diſtrict of Greece, afterwards called Doris; the Ionians, whoſe name was finally loſt in the more illuſtrious appellation of Athenians, ſettled in Attica; and the Æolians peopled Elis and Arcadia, the weſtern and inland regions of the Peloponneſus. At the diſtance of twelve centuries, obſcure traces of the Pelaſgi occurred in ſeveral Grecian cities; a diſtrict of Theſſaly always retained their name; their colonies continued, in the fifth century before Chriſt, to inhabit the ſouthern coaſt of Italy and the ſhores of the Helleſpont: and in thoſe widely ſeparated countries, their ancient affinity was recognized in the uniformity of their rude dialect and barbarous manners, extremely diſſimilar to the cuſtoms and language of their Grecian neighbours.

Greece, even in this early ſtate, was not left to be ſlowly civilized by the progreſſive ingenuity of the Hellenic tribes. The happy poſition of a country, which, forming as it were the frontier of Europe with Aſia, is divided only by a narrow extent of ſea from Egypt and Syria, and ſituate within reach of thoſe parts of the eaſt which were anciently moſt flouriſhing and populous, naturally invited the viſits of travellers, and attracted the eſtabliſhment of foreign colonies. Theſe foreign colonies were conducted by Cecrops and Danaus, Egyptians who, about 1556 years before Chriſt, reſpectively ſettled in Athens and Argos; Cadmus, a Phenician, who founded Thebes in Bœotia; and Pelops, a Phrygian, whoſe deſcendants, intermarrying with thoſe of Danaus king of Argos, and Tyndareus king of Lacedæmon or Sparta, acquired in the perſon of Agamemnon ſo powerful an aſcendancy over the Peloponneſus. The family of Deucalion ſtill reigned in Theſſaly; but Thebes, Athens, Argos, and Sparta, which were long regarded as the principal cities of Greece, thus fell under the dominion of four foreign lines of princes, whoſe exploits and misfortunes are immortalized by the firſt and nobleſt productions of Grecian literature; the writings of Homer and Pindar.

The Phenicians being conſidered as the principal navigators and merchants of the ancient world, it is commonly believed that the example of the Phenician colonies firſt taught the Greeks to brave the dangers of the ſea, and to maintain a commercial intercourſe with each other, as well as with foreign nations. But it is ſufficient to throw a glance on the geography of Greece, to perceive how naturally commerce, without foreign aid, might have ariſen ſpontaneouſly in that highly-favoured country. The continent *itſelf*, waſhed on three ſides by the ſea, is ſurrounded by innumerable iſlands, abounding in excellent harbours. The variety of ſoils and productions is greater, perhaps, than in any other part of the world of an equal extent. All the ſhores of the Mediterranean, comprehending the moſt beautiful, and anciently the moſt flouriſhing, part of the earth, are more acceſſible to Greece than to any neighbouring country. Yet it appears from the light of hiſtory, that the Greeks did not early avail themſelves of their fortunate ſituation, or of the ſuppoſed leſſons of their Phenician inſtructors. At length, however, the northern diſtricts of Theſſaly having greatly ſuffered by invaſion, the petty princes of that province entered into a confederacy for their mutual defence. They aſſembled at Thermopylæ, a place then governed by Amphictyon; whence aroſe the *Amphictyonic* council. The advantages which the confederates derived from this meaſure, were ſoon perceived by their neighbours. The central ſtates gradually acceded to their alliance; and, about the middle of the fourteenth century before Chriſt, Acriſius king of Argos, and other princes of the Peloponneſus, were admitted to ſhare the benefits and ſecurity of ſo uſeful an aſſociation. This eſtabliſhment of the Amphictyons naturally brought together the chiefs moſt diſtinguiſhed by birth and bravery. Glory and emulation prompted them to arms, and revenge directed thoſe arms againſt the barbarians. Jaſon, Admetus, and other chieftains of Theſſaly, having equipped a ſmall fleet in the neighbouring harbour of Iolcus, and particularly the ſhip Argo, of ſuperior ſize to any before known, were animated with a deſire to viſit foreign lands, and to plant colonies in thoſe parts that appeared moſt delightful, in order to retort on their inhabitants the injuries which Greece had ſuffered from ſtrangers. The princes of the north having proclaimed this ſpirited deſign, the ſtandard of enterpriſe was ſpeedily ſurrounded by the flower of the Grecian youth, who eagerly embraced this opportunity to ſignalize their valour. Peleus, Tydeus, Telamon, and the fathers of thoſe heroic chiefs, who, in the ſucceeding age, ſhone with diſtinguiſhed luſtre in the plains of Troy, are numbered among the leaders of the Argonautic expedition, which took place in the year 1263 before Chriſt.

Theſe adventures, however, have been over-much adorned by the fictions of poetry, to be the proper ſubjects

jects of hiſtorical detail. The deſigns of the Argonauts are veiled under the allegorical phraſe, "of carrying off the golden fleece;" which, though eaſily explained, if we admit the report that the inhabitants of the eaſtern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from Mount Caucaſus, is yet deſcribed in ſuch various language by ancient writers, that almoſt every modern who examines the ſubject, thinks himſelf entitled to offer, by way of explanation, ſome new conjecture of his own. But in oppoſition to the moſt approved of theſe conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to eſtabliſh plans of commerce, or to ſearch for mines of gold. The real object of the expedition may be diſcerned in its effects. The Argonauts fought, conquered, and plundered; they ſettled a colony on the ſhores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princeſs of Egyptian extraction, whoſe crimes and enchantments are condemned to infamy in the claſſic lines of Euripides.

Notwithſtanding the romantic fictions which diſfigure the ſtory of the Argonauts, their undertaking appears to have been attended with a happy effect on the manners and character of the Greeks. From the era of this celebrated expedition, we may diſcover not only a more daring and more enlarged ſpirit of enterpriſe, but a more deciſive and rapid progreſs towards civilization and humanity. When this new field firſt opened to the ambition of the Greeks, they cultivated it with a degree of induſtry equally ardent and ſucceſsful. Innumerable were the exploits of Hercules, of Theſeus, and of the ſons of Leda, to promote the intereſt and ſafety, not of their particular tribes, but of the general confederacy. The Grecian woods and mountains abounded in lions, boars, and other fierce animals, that often roamed from their haunts, and ſpread terror and deſolation through the adjoining vallies. The vallies themſelves teemed with men of brutal ſtrength and courage, who availed themſelves of the weakneſs of the government to perpetrate horrid deeds of violence and cruelty. The firſt heroes of Greece, animated rather with the daring and uſeful, than with the romantic, ſpirit of chivalry, ſet themſelves with one accord to remedy evils which threatened the very exiſtence of ſociety. Their adventures have, doubtleſs, been embelliſhed by the fancy of poets and orators; but, nevertheleſs, they will remain eternal monuments of that generous magnanimity, which ſacrifices the love of eaſe and pleaſure to a thirſt for glory and renown.

The firſt grand enterpriſe which ſucceeded the expedition of the Argonauts, proves that whole communities, as well as individuals, had begun to reſpect the virtues moſt eſſential to public happineſs. The war of Thebes has deſerved, therefore, to be recorded; while the more ancient hoſtilities between the Hellenic tribes, of which juſtice was not even the pretence, but luſt or avarice the only cauſe, are univerſally condemned to oblivion. Contempt of an ancient oracle, the involuntary crimes of Oedipus, and the unnatural cruelty of his ſons, involved the royal family of Thebes in thoſe calamities, which were choſen by Sophocles as important hiſtorical ſubjects for the tragic muſe. Eteocles and Polynices, ſons of Oedipus, having haſtened the death, and drawn down the maledictions, of their unhappy father, agreed to ſway, by turns, the Theban ſceptre. Eteocles the elder, reigned during the firſt year; but his ambitious temper, corrupted by a luſt for royalty, refuſed to reſign the throne at the appointed time. His rival, Polynices, married the daughter of Adraſtus king of Argos, who enabled his ſon-in-law to aſſert, by force of arms, his claim of alternate inheritance. The allied princes, reinforced by Tydeus, Capaneus, and three other chiefs, marched to Thebes, and inveſted the ſeven gates of the city, in the year before Chriſt 1225. The Thebans, impatient of confinement, yielded to the martial ardour of Eteocles, and repelled the aſſailants by a vigorous ſally, in which the moſt illuſtrious combatants fell on both ſides, and the wretched brothers periſhed by mutual wounds. The cauſe of the war being removed by this fatal cataſtrophe, the Argives begged leave to bury their dead; but the Thebans, exaſperated againſt the invaders of their country, refuſed them even ſo natural an indulgence. In this extremity, Adraſtus, the only chief who ſurvived the battle, had recourſe to the Athenians, who, uninfluenced by motives of ambition or intereſt, took arms in defence of public juſtice, and compelled the cruel obſtinacy of the Thebans to grant the laſt melancholy honours to the aſhes of their deceaſed enemies. At the diſtance of ten years, the ſons of the chiefs who had fallen before Thebes, reſented the indignities that had been thus offered to the manes of their fathers, and again laid ſiege to the city, deſtroyed the lives and property of many of the inhabitants, dragged others into captivity, and compelled the remainder to acknowledge the ſon of the injured Polynices as their king.

In their progreſs towards civilization, the Greeks ſoon perceived the advantages of political confederacy. Summoned to arms againſt foreign enemies, they readily flocked to the ſtandard of their king, and received with implicit ſubmiſſion his commands in the field; but when no common cauſe excited their valour, the inhabitants of each townſhip aſpired at independent juriſdiction, and the nominal ſubjects of the ſame prince often terminated their differences by an appeal to the ſword. To ameliorate ſuch diſorderly communities by municipal laws, required an example from ſome civilized people, among whom the effects of good government happily prevailed. Such an example occurred in the wiſe inſtitutions and policy of the Cretans, which are repreſented not only as the moſt ancient, but the beſt regulations that ever were eſtabliſhed in any portion of the Grecian territory. This celebrated iſland, which fable has dignified with the imaginary honour of giving birth to ſome of the gods, poſſeſſed the merit of communicating to Greece many uſeful improvements. Rhadamanthus, and others of its early kings, whom intereſt or curioſity carried into Egypt and the eaſt, appear to have had ſagacity to obſerve, and dexterity to employ, ſeveral of the inventions and inſtitutions of thoſe civilized kingdoms, for the purpoſe of confirming their own authority, and bridling the intemperate paſſions of their countrymen. The elder Minos is particularly diſtinguiſhed for promoting this beneficial deſign. The appellation of "Son of the Ocean," which he probably derived from his numerous voyages, leaves it uncertain whether he was a native Cretan, or a foreigner. But however this may be, he appears to have had ſufficient addreſs to perſuade the Cretans that he was admitted to the familiarity of the gods. From them he pretended to have derived a ſyſtem of laws, which he was enjoined to engrave on tables of braſs. The arrangement of this political code ſtruck the diſcerning eye of Theſeus, in his celebrated expedition to Crete, during the reign of the ſecond Minos, who had ſubdued ſeveral of the circumjacent iſles, and checked the piratical depredations of the Carians, Lycians, and Phenicians. Athens itſelf experienced the effects of his power and ambition, and reluctantly ſubmitted to a diſgraceful tribute of ſeven youths and ſeven virgins, thus cruelly exacted by a nation ſubſiſting from the labour of ſlaves. The tributary captives were drawn by lot from the body of the people, who trembled at the annual return of the Cretan veſſel. Diſcontents aroſe againſt the ſupine government of Ægeus king of Athens, when Theſeus, his heroic ſon, generouſly offered his life in the ſervice of his country. The fame of Theſeus had already reached the ears of Minos, who was ſtruck with admiration on beholding

holding the Athenian prince a voluntary captive. Minos treated him with affectionate regard; gave him his daughter Ariadne in marriage; and declared the Athenians from thenceforth free. Theſeus reaped immortal glory from this tranſaction; and the veſſel in which he ſailed continued to be annually ſent, for more than eight centuries afterwards, to return thanks to Apollo in his favourite iſland of Delos.

From the HEROIC AGE, to the FALL of TROY, and INSTITUTION of the OLYMPIC GAMES.

The ancient Greeks had ſtrongly imbibed an opinion, that the country in which they lived was ſo peculiarly favourable to the dignity of human nature, as to aſſimilate their heroes with the immortality of the gods. The voluptuous climates of Aſia produced invention and ingenuity, but ſoftened the tempers of men into a fitneſs for ſervitude. The rigorous ſeverity of European ſkies gave ſtrength to the limbs, and boldneſs to the mind; but chilled the fancy, and benumbed the finer feelings of the ſoul. The inhabitants of the eaſt and ſouth were degraded below the condition of humanity, by an unfortunate abuſe of power; while the turbulent ſons of the north and weſt were incapable, from ignorance and indocility, of ſubmitting to any regular ſyſtem of government. The Greeks alone, poſſeſſing an intermediate ſituation between the extremes of cold and heat, united both courage and capacity; tempered the ſtern and manly with the gentler virtues; and enjoyed the double advantage of liberty and laws. Thoſe who would repreſs the ebullitions of Grecian vanity, advert to the generous ſpirit of the ancient Germans; their military glory, impartial juſtice, and manly inſtitutions, as painted by the expreſſive pencil of Tacitus, ſcarcely inferior to the boaſted cuſtoms of the heroic age.—See the article GERMANY, p. 464 of this volume.—Yet there is one material circumſtance wanting in the German, which adds peculiar beauty to the Grecian character. Among the rude inhabitants of ancient Germany, the offices of prieſt and king were not united in the ſame perſon. The rites of religion were adminiſtered by a particular order of men, whoſe minds were of a dark and gloomy caſt, recommending principally the practice of courage, the only virtue which there was not any occaſion to recommend; and promiſing, as the reward of what was deemed the higheſt excellence in life, the enjoyment of an infamous paradiſe of immortal drunkenneſs after death. But the mythology of the Greeks was of a more elevated and uſeful nature. The ſceptre, which denoted the connection of civil power with ſacred protection, was conferred on thoſe only who were appointed to be the chief guardians of the people. The ſame voice that ſummoned the warriors to arms, or that decided in time of peace their domeſtic contentions, conducted the order of their religious worſhip. The ſubmiſſion of ſubjects to their prince, the duty of a prince to preſerve inviolate the rights of his ſubjects, the obedience of children to their parents, the reſpect of the young for the aged, the ſacred laws of truth, juſtice, honour, and decency, were inculcated and maintained by the Grecian heroes, in common with the rights of peace and of war. As the reward of religion and virtue, of heroiſm and fidelity, were to be derived from the gods; ſo the puniſhment of irreligion and vice, of injuſtice and rapine, failed not to be viſited upon them, even to the third and fourth generation, by ſome manifeſt vengeance of their offended deities.

Such was the ſimple creed of the ancient Grecians. But it is not within the limits of this treatiſe to diſplay the mythological tenets of Greece, or the imaginary offices of their numerous divinities. By the dim light of etymology and tradition, thrown on the deceitful glare of legend and fable, inquiſitive men have endeavoured to trace the corrupted ſtreams of Pagan worſhip to the pure fountain of the Jewiſh diſpenſation. But the majeſty of Jehovah is very feebly repreſented by the united power of Homer's divinities; and the mythology of the Greeks is of ſuch a peculiar texture, that whenceſoever originally derived, it muſt have undergone a particular modification in the Grecian ſoil; nor is it eaſy to concur with the opinion of writers who bring it either from Egypt, Chaldea, or Leſſer Aſia, when we conſider that there is not the ſmalleſt veſtige in Homer of the judicial aſtrology which prevailed ſo ſtrongly in the two firſt, or of the worſhipping of idols, which almoſt univerſally predominated in the laſt. It would perhaps be more conſonant to truth and reaſon, were we to attribute their tenets and mythology to the powers of the mind, oppreſſed or alarmed by the terrors of ſuperſtition. Even among poliſhed nations, the power of reaſoning and philoſophy, however highly it may be extolled when the gentle current of life flows with placid tranquillity, always proves too feeble to reſiſt the mountain torrent and the ſtorm of winter. Under the preſſure of ſudden or inextricable calamity, all thoſe, who are not more or leſs than men, have recourſe to the immediate aſſiſtance of ſome inviſible agency; and in the ſplendid abodes of wealth and power, as well as in the American village or Tartar horde, the era of a famine, a peſtilence, or an earthquake, is marked by ſincere expreſſions of faith, and commemorated by ſignal monuments of piety.

The great pillar of ſuperſtition raiſed by the anxious paſſions of men, ſeems to have been fortified in Greece by a circumſtance incidental to all nations, at a certain ſtage of their political progreſs. There is a period when nations emerging from barbarity, but not yet corrupted by the narrow purſuits of avarice, nor ſoftened by the pleaſures of luxury, enjoy a peculiar ſenſibility of character, which exerts itſelf in the ardour of ſocial affection, and ſtrengthens, by a thouſand aſſociations, their belief of inviſible and intelligent beings. To men thus diſpoſed to ſuperſtition, whatever dazzles the imagination announces the preſence of a deity; dreams and celeſtial phenomena are deemed ſacred and infallible admonitions; the ſilence and thick ſhade of a foreſt fills the ſoul with religious awe; and perſons, diſtinguiſhed by juſtice and piety, eaſily perſuade themſelves and others, that, as the beloved favourites of heaven, they are frequently honoured with holy inſpirations, and ſometimes indulged with the viſible preſence and happy intercourſe of their divine protectors. Not only the religion, but the ancient language and manners, of Greece, ſufficiently atteſt the exiſtence of this exceſſive ſenſibility, which, in thoſe early times, gave an eaſy victory to the indulgent powers of fancy over the ſeverer dictates of reaſon. The nature, the characters, and the occupations, of the gods, were hence ſuggeſted by the lively feelings of an ardent, rather than by the regular invention of a cultivated, mind. Theſe celeſtial beings were yet ſubject to the blind paſſions which govern unhappy mortals. Their wants, as well as their deſires, were ſimilar to thoſe of men. They required not the groſs nouriſhment of meat and wine, but they had occaſion to repair the waſte of their ethereal bodies by nectar and ambroſia; and they delighted in the ſteam of the ſacrifices, which equally gratified their ſenſes, and flattered their vanity. The refreſhment of ſleep was neceſſary to reſtore their exhauſted ſtrength; and, with the addition of a ſuperior but limited degree of power, and wiſdom, and goodneſs, the gods of the heroic ages were nothing more than immortal men. What was wanting in the dignity and perfection, was ſupplied by the number, of the gods. Homer only deſcribes the principal and reigning divinities; but Heſiod, who gives the genealogical hiſtory of this fanciful hierarchy, makes the whole number amount to thirty thouſand. Among theſe, every virtue had its protector, every quality of

extenſive power in human life had its patron, and every grove, and mountain, and river, its favourite inhabitants. Twelve divinities of ſuperior rank preſided over the active principles of the univerſe, and the leading virtues of the mind: but even theſe diſtinguiſhed beings were ſubject to the unrelenting power of vengeance and the fates, "who purſue the crimes of men and gods, and never ceaſe from their wrath till they have inflicted juſt puniſhment on the guilty ſons of earth and heaven." *Heſiod.* Theog.

It would require a volume to illuſtrate the ſalutary effects of this ancient and venerable ſuperſtition, which was diſtinguiſhed above moſt other falſe religions by the uncommon merit of doing much good, without ſeemingly occaſioning any conſiderable harm, to ſociety. The Grecian tenets, while they inculcated profound reſpect to the gods, tended not to break the ſpirit, or to repreſs the courage, of their warlike votaries. The ancient heroes addreſſed their heavenly protectors in an erect poſture, with the unfeigned ſincerity of manly freedom. They expected to avert the calamities threatened by the anger of their divinities, not by inflicting on themſelves ſuch tortures as could be acceptable only to the mean reſentment of weak and wicked beings, but by repairing the wrongs which they had committed againſt their fellow-citizens, or compenſating by new attentions for the neglect ſhewn to the ceremonies of their national worſhip. The dangerous power of oracles, the abuſed privileges of aſylums, the wild raptures of prophetic enthuſiaſm, the abominable ceremonies of the Bacchanalia, and the horrid practice of human ſacrifice, circumſtances which cover with infamy the later periods of paganiſm, were all unknown to the purity of the heroic age; nor is there to be diſcovered the ſmalleſt veſtige of any of theſe wild or wicked inventions, either in the writings of Homer, or of his contemporary Heſiod.

The perfection of civil and political inſtitutions, which was produced in Greece by the influence of religion, is found in moſt countries to be proportional to their improvements in arts, and their attainments in knowledge; while the happy effects of domeſtic union are frequently moſt conſpicuous among rude and ſimple nations. The reciprocal duties of the governor and the governed, as well as the mutual obligations of ſubjects, are gradually unfolded and enlarged by the progreſſive ideas of utility; but the tender connections of huſband and wife, of father and ſon, of brothers and kinſmen, excite, without reflection, the warmeſt feelings of the heart, and at once inſpire the affectionate ſentiments of love and friendſhip, of kindneſs and gratitude. Agreeably to theſe obſervations, we find in the hiſtory of the heroic age the moſt intereſting pictures of conjugal love, of parental affection, and of filial duty.

Two circumſtances render it difficult to explain with certainty the rank and condition of women in the heroic age. The Greek word denoting a wife, is borrowed from a quality which equally applies to a concubine, and the ſame term is uſed indifferently to expreſs both. But the women who in ancient Greece ſubmitted to the infamy of proſtitution, were generally captives taken in war, who were reduced by the cruel right of arms to the miſerable condition of ſervitude. Hence it has been erroneouſly inferred, that in ancient Greece, wives as well as concubines were the ſlaves of their huſbands. This miſtaken notion it has been attempted to confirm, not only by inſiſting on the humiliating condition of the fair ſex in the later ages of Greece, but by expreſsly aſſerting, that, in ancient times, they were purchaſed by their huſbands. But this is to ſupport one error by another. Before entering into the ſtate of wedlock, it was cuſtomary for a man to make a mutual exchange of preſents with his intended father-in-law. The Greeks had particular terms to expreſs the preſent which he beſtowed, as well as that which he received. The former, which has no correſponding term in the modern languages, is tranſlated by the more general word "*price*," which has given riſe to the falſe notion of the purchaſe and ſervitude of women; but the latter, which may with propriety be tranſlated "*dower*," was given as a proviſion for the wife, both during marriage, and after its diſſolution; and was ſufficient to deliver her from that ſuppoſed ſtate of dependence on the huſband, which never had any exiſtence but in the imagination of ſuperficial writers.

The attention of the Grecian ladies was chiefly confined to domeſtic cares, or to the practice of ſuch arts as required neither ſtrength, nor courage, nor wiſdom, but only the patient exertions of female dexterity. Our natural reſpect for the honour of the ſex might be offended at hearing them as much extolled for their ſkill in the productions of the loom, as for their beauty and virtue; but it deſerves to be conſidered, that weaving and embroidery being, like all other arts, leſs extenſively diffuſed in Greece than in improved commercial countries, were on this account more highly valued, and therefore better adapted to confer diſtinction on thoſe who excelled in them. They were practiſed by ladies of the higheſt rank, and even by queens, who alſo thought it an honour to be entruſted with the education of their children till they became fit for the ſociety of their fathers. Beſides theſe employments, the women were permitted to join in the celebration of religious rites, and many of them were conſecrated to the ſervice of particular divinities. In the ſeaſons of public feſtivity, they mixed more freely in the ſociety of the other ſex. This was ſometimes attended with ſuch inconveniences as might naturally be expected to ariſe in conſequence of the uſual reſtraints impoſed on their behaviour. "The beautiful Polymela, (ſays Homer,) dancing in the chorus of Diana, was embraced by Mercury; but ſhe had no ſooner brought forth a ſon, than one of the principal citizens offered her his hand." The inſtitutions of the heroic age promoted, with admirable propriety, the modeſt reſerve of women, while they permitted not one tranſient error to cover an amiable character with indelible infamy. The crime of having too tender a heart was not deemed inexpiable; and, as the conſequences of female weakneſs were imputed to the affectionate ardour of ſome amorous divinity, they were ſo far from obſcuring the charms of beauty, that they adorned it with new graces and more conſpicuous ſplendour.

The ſentiments of parental affection in the heroic age, were proportionably ſtrong and ardent. The reverence of children for their parents approached their veneration for the gods. The moſt violent and impetuous heroes ſubmitted, without reluctance, to the ſevereſt dictates of paternal authority. They relinquiſhed their favourite inclinations, diſavowed any will of their own, and committed their deareſt concerns to the experienced wiſdom and goodneſs of their fathers. The amiable expreſſions of filial reſpect were extended into a more general ſentiment of regard for the infirm and aged. Even among brothers who were nearly of the ſame age, the younger was obliged to yield in every inſtance to the elder; and it was an acknowledged principle of religion, that the Furies defended, by their ſtern authority, the ſacred rights of ſuperior years.

War was the principal employment of the heroic age; and in the field they both diſplayed their nobleſt qualities, and diſcovered the greateſt defects of their character. They marched to the field in a deep phalanx, ruſhed impetuouſly to the attack, and bravely cloſed with their enemies. Each warrior was firmly buckled with his antagoniſt, and compelled by neceſſity to the ſame exertions of valour, as if the fortune of the day had depended upon his ſingle arm. Their principal weapon was the javelin or ſpear, which, thrown by the nervous vigour of a ſteady hand, often penetrated the

firmeſt ſhields and bucklers. When they miſſed their aim, or when the ſtroke proved ineffectual through want of force, they drew their ſwords, and, ſummoning their utmoſt reſolution, darted impetuouſly on the foe. They had bows, and ſlings, and darts, intended for the practice of diſtant hoſtility; but the uſe of theſe weapons, which were much employed in the military paſtimes of the heroic age, was confined in the field to warriors of inferior renown. Their defenſive armour was remarkably complete: a bright helmet, adorned with plumes, covered the head and face, a firm corſlet defended the breaſt, greaves of braſs deſcended to the feet; and an ample ſhield, looſely attached to the ſhoulders, and turning in all directions, oppoſed its firm reſiſtance to every hoſtile aſſault.

Before any war could be lawfully undertaken, it was neceſſary to diſpatch ambaſſadors, who might explain the injury that had been done, demand immediate and complete ſatisfaction; and if this was refuſed, denounce in form the reſolution of their community to proſecute its claim by force of arms. After they had begun to execute their purpoſe, the characters of heralds, thoſe ſacred miniſters of kings, were equally reſpected by friends and foes. They travelled in ſafety through the midſt of embattled hoſts, proclaimed to the ſilent warriors the commiſſions with which they were entruſted, or demanded a truce for burying the dead, which could not be refuſed without enormous impiety. The uſe of poiſoned weapons was forbidden, under pain of the divine diſpleaſure. It was agreeable to the will of the gods that the life ſhould be ſpared, when a ſufficient ranſom was promiſed. And after a treaty of peace was concluded between hoſtile nations, without any apparent ratification but the honour of the contracting parties, the perfidious wretches who betrayed the ſanctity of their engagements, were devoted, amidſt ſolemn ſacrifices and libations, to the fury of the goddeſſes.

From the arts of peace the early Greeks had acquired the neceſſaries, and procured the accommodations, but had not obtained the luxuries, of life. Paſturage and agriculture ſupplied them with the moſt indiſpenſable articles of food, and with the principal materials of clothing. The implements of huſbandry were extremely imperfect; the plough, the moſt uſeful of them all, being compoſed entirely of wood, which aroſe rather from the ſcarcity of iron than from any defect of mechanical ingenuity. They employed, in the time of Heſiod, the invention of ſhears, for depriving the ſheep of their wool, having formerly waited the ſeaſon of its annual ſeparation by nature. Barley was the principal produce of their fields, and furniſhed the ordinary food both of men and of horſes. The invention of mills was unknown, and the grain underwent ſeveral tedious operations, in order to facilitate the bruiſing of it between two large ſtones with the hand. Although the Greeks cultivated the olive, they were unacquainted with the benefit derived from the fruit of this plant, ſo well adapted to cheer the melancholy gloom of night. The Grecian ſoil was naturally favourable to the grape; but the long and operoſe proceſs by which the juice of it was ſeparated and prepared, rendered wine ſcarce and dear.

In the heroic age men had neither leiſure nor inclination to attend to the ſpeculative ſciences. All the knowledge that they poſſeſſed or eſteemed was of the practical kind. From arithmetic they learned ſuch ſimple calculations as ſuited the narrow ſphere of their tranſactions. Aſtronomy taught them to obſerve the conſtellations moſt neceſſary to direct the adventurous courſe of the mariner: but their navigation was ſtill ſo imperfect that they ſeldom abandoned the coaſts; and the only ſtars mentioned by Homer are the Great and Little Bear, the Pleiades, the Hyades, Orion, and the Dog Star. The main objects propoſed in the education of the young warriors were, that they ſhould learn to excel in the military exerciſes of the age, eſpecially thoſe of throwing the lance and of driving the chariot, and to command the attention of the ſenate, or aſſembly, by delivering their opinion in a perſpicuous, elegant, and manly, ſtyle. The funeral games, and thoſe celebrated in commemoration of ſeveral important events, both of a civil and ſacred kind, opened a continual ſource of entertainment. There the young and vigorous contended in the rapid race; wielded the maſſy ceſtus or ponderous quoit; and exerted equal efforts of ſtrength and ſkill in the other manly exerciſes which confirm the vigour of the body and the fortitude of the mind. Nor were the aged and infirm allowed to languiſh for want of proper objects to rouſe their emulation, to flatter their pride, and to employ their remaining activity. It belonged to them to offer their wiſe counſels, to interpoſe their reſpected authority, and to decide the quarrels, as well as to determine the merit, of the young candidates for fame. The applauſe and rewards beſtowed on him whoſe councils and deciſions were moſt generally approved, conſoled the weakneſs of his declining years, while his rivals, though diſappointed for the preſent, expected, on ſome future occaſion, to obtain the ſame honourable marks of the public eſteem.

In the heroic age, the Greeks had advanced beyond that uniform inſipidity of deportment, that ſullen ferocity of manners, and that hardened inſenſibility of heart, which univerſally characteriſe the ſavage ſtate. They ſtill poſſeſſed, however, that patient intrepidity, that noble ſpirit of independence, that ardent attachment to their friends, and that generous contempt of pain and danger and death, which render the deſcription of the wild tribes of America ſo intereſting to a philoſophic mind. Of two principal enjoyments of life, ſtudy and converſation, they were little acquainted, indeed, with the conſolations and pleaſures of the firſt, the want of which was compenſated by the ſincerity, the confidence, the charms, of the ſecond. Their ſocial affections were leſs comprehenſive in their objects, but more powerful in their effects, than thoſe of poliſhed nations. A generous chief ruſhes to certain death, to revenge the cauſe of his friend; yet refuſes to the prayers of an aged parent the melancholy conſolation of interring the remains of his favourite ſon; till the correſponding image of his own father ſtrikes his mind, and at once melts him to pity. The imaginary wants and artificial paſſions which are ſo neceſſary to urge the hand of induſtry, and to vary the purſuits of men, in improved commercial ſocieties, were ſupplied to the Greeks by that exceſſive ſenſibility, which intereſted them ſo deeply in the affairs of their community. As they were not acquainted with the ſame diverſity of employments, ſo neither were they fatigued with the ſame giddy round of diſſipated pleaſures which augment the ſplendid miſery of later times. Though ignorant of innumerable arts which adorn the preſent age, they had diſcovered one of ineſtimable value—to render the great duties of life its moſt eſſential amuſement. It will not, perhaps, be eaſy to point out a nation who united a more complete ſubordination to eſtabliſhed authority with a higher ſenſe of perſonal independence, and a more reſpectful regard to the dictates of religion with a more ardent ſpirit of martial enterpriſe. The generous quality of their political eſtabliſhments, and their fancied intercourſe with the gods, conſpired to raiſe them to a certain elevation of character which will be ſtedfaſtly remembered, and for ever admired.

Such was the heroic age at the commencement of the Trojan war, when all the Grecian ſtates had embraced one uniform ſyſtem of government, uniting the independent ſpirit of European freedom with the reverential ſuperſtition of Egypt and Aſia. This ſingular frame of political alliance was peculiarly adapted to great and generous undertakings: it ſerved to rouſe them to diſtant

tant and difficult enterprises, and animated and supported them under every peril during the ten years' siege of Troy.

Before we notice the incidents of this celebrated siege, it may be proper to take a short view of the strength and resources of the two nations, who were so eager to plunge themselves into a conflict, that totally destroyed the one, and proved extremely ruinous to the other. Exclusive of the provinces of Epirus and Macedonia, the continental possessions of the Greeks were nearly equal to Scotland in extent, but marked with bolder features, and blessed with a warmer sun. In its length, the whole country is almost equally divided by two opposite gulphs, compressing between them a mountainous neck of land, to the breadth of only five miles, into the peninsula of Peloponnesus, and the territory extending northwards, from the extremity of the Corinthian isthmus to the southern frontier of Macedonia. The Peloponnesus, an hundred and sixty miles in length, and scarcely one hundred in breadth, is every where intersected by mountains, particularly the towering ridges of Zarex and Taygetus. During the flourishing ages of Greece, this small peninsula contained seven independent communities of unequal power and fame, which ranked in the following order: The comparatively large and highly diversified territory of Laconia; the fruitful vale of Argos; the extensive coast of Achaia; the narrow but commercial isthmus of Corinth; the central and mountainous region of Arcadia; together with the more level countries of Elis and Messenia, which are better adapted to tillage than any other provinces of the Peloponnesus. The Grecian possessions beyond the Corinthian isthmus were more considerable, extending above two hundred miles from east to west, and one hundred and fifty from north to south. They were naturally divided by the towering ridges of Olympus, Pindus, Oeta, and Ossa, into nine separate provinces; which, during the celebrated ages of Grecian freedom, were occupied by nine independent republics. They comprehended the extensive and fertile plains of Thessaly and Bœotia, both of which were, in early times, much exposed to inundations; and the latter, abounding in subterranean caverns, was peculiarly subject to earthquakes; the less fertile, but more secure, territory of Attica; the western provinces of Ætolia and Acarnania, encompassed on one side by dangerous seas, and confined on the other by almost impassable mountains; and the four small rocky districts of Phocis, Doris, Locris, and Megara.

It has been observed, that these names and divisions, which remained to the latest times, are accurately marked by Homer, whose poems continued, through succeeding ages, to be the standard to which neighbouring communities appealed in adjusting their boundaries. This observation, however, must be qualified by two exceptions. During the Trojan war, the extensive province of Thessaly sent forth above a fourth part of the whole Grecian strength, and was divided among many warlike leaders. It might naturally be expected, while agriculture and pasturage were the principal occupations subservient to human life, that a country abounding in plains and meadows should excel in population and in power. When commerce, navigation, and the mechanic arts, enriched and adorned the middle and southern divisions of Greece, the northern district of Thessaly lost its ancient pre-eminence. The second exception arose from the extensive power of the house of Pelops, which had acquired dominion over the northern and eastern parts of the Peloponnesus, formerly containing several independent principalities; and, after the misfortunes of Agamemnon and his family, was again divided into the republics of Sparta, Argos, Corinth, and Achaia. From this idea of the country, it will not appear remarkable, that, in an age when every citizen was a soldier, Greece should have raised an army of an hundred and two thousand men. The Acarnanians alone, for reasons unknown, sent no forces to Troy. But the continent was assisted by the efforts of Crete, of Rhodes, and of many smaller islands, which were subject only to their respective princes, or governed by the wide-extended dominion of Agamemnon. The vessels collected for transporting these forces to Asia amounted to twelve hundred sail. They were equipped at little expence, being moved by only one bank of oars, and entirely unprovided with decks. Their complement varied in different vessels; some containing an hundred and twenty, others only fifty, men, who appear to have been equally trained to the military art, and the rude simplicity of ancient navigation.

The celebrated kingdom of Priam, against which this armament was directed, occupied the eastern banks of the Hellespont, the southern coast of the Propontis, and the northern shores of the Ægean Sea. From the river Esepus to the promontory of Lectum, the Trojan dominions extended in length two hundred miles; but their breadth was less considerable, being compressed between three seas, and the lofty ridges of mount Ida. This picturesque country, which excelled Greece in fruitfulness, was distinguished by the epithet of Hellespontian, from the large inland province which bore the name of Phrygia. It was planted, according to tradition, by a Grecian colony, about two hundred years before the Trojan war.

From the prevalence of the Grecian language and customs on the one hand, and the name of the country on the other, it has been supposed that the Trojans were a mingled race of Greeks and Phrygians, collected by Dardanus, the fifth ancestor in degree to old Priam. This adventurer, whose parentage Homer leaves uncertain, by calling him son of Jupiter, founded a city on one of the western branches of mount Ida, commanding a beautiful and fertile plain, watered by the rivers Simois and Scamander. The new settlement flourished under his son Erichthonius, who, by the judicious management of his mares and stallions, supplied the neighbouring kingdoms with horses of a superior breed. His successor, Tros, communicated his name to the territory, which was often called Troas, and to the celebrated city Ilion, which his son Ilus, having removed his residence from the mountain, built on the adjoining plain. Laomedon, the successor of Ilus, fortified the town of Ilion, or Troy, with walls of such uncommon strength, that, in the language of the times, they were said to be the work of the gods. Whether he defrauded his auxiliaries of their promised rewards and sacrifices, or supplied the expence of this undertaking by despoiling their sacred shrines, it is certain that the guilt of Laomedon was believed to entail calamity on his descendants. His son Priam, however, long enjoyed the choicest gifts of fortune before he was overtaken by the vengeance of heaven. Having attained extreme old age in the undisturbed possession of his throne, he was surrounded by a numerous and flourishing family, beloved by his subjects, and respected by his neighbours: yet this amiable prince was destined to feel the sharpest pangs of human misery.

Hereditary feuds had long subsisted between the ancestors of Priam and those of Agamemnon, when the latter quitted their establishments in Asia, to seek new settlements in Greece. The unnatural insult offered to Ganymede, a beautiful Trojan youth, by Tantalus father of Pelops, was retorted on Menelaus, the fourth in descent from that prince, by the rape and detention of his queen, the celebrated Helen. Paris, the ill-fated son of Priam, was the author of this new injury. Helen was the daughter of Tyndareus king of Sparta. The high honours of her family were adorned by the generous magnanimity of her brothers, Castor and Polydeuces, whose exploits shone conspicuous in all the military expeditions of that gallant age. But the native

luſtre of Helen needed not the aid of foreign ornament. Even in the tender age of childhood, her opening charms had inflamed the heart of Theſeus, the moſt virtuous and magnanimous of the Grecian chiefs. The fame of her beauty increaſed with her ripening years, and her perſon became an object of contention among thoſe who, by birth or merit, were entitled to aſpire at the invaluable prize. The princely mien and inſinuating manners of Menelaus were preferred to the more ſolid qualities of his numerous competitors. Having married the heireſs of Tyndareus, he ſucceeded, in her right, to the Spartan throne. The graceful pair had not long enjoyed the ſweets of conjugal union, when their happineſs was blaſted by the arrival of Paris, the handſomeſt man of his age, and formed to captivate the weakneſs of a female mind. Though a ſoldier of no renown, Paris had imbibed the romantic ſpirit of gallantry, and was diſtinguiſhed by an ardent paſſion for beauty, which, notwithſtanding the ſoftneſs of his character, prompted him to brave every danger in purſuit of his favourite object. Animated by this view, he ſeized the opportunity of a voyage of Menelaus into Crete:—he viſited the dominions of his hereditary enemies, and ſolicited the rights of hoſpitality at the Spartan court. His perſon, his accompliſhments, his addreſs, and, ſtill more, the voluntary hardſhips which he profeſſed to have long endured for her ſake, ſoon ſeduced the affections of the Grecian queen. Enamoured of the elegant ſtranger, ſhe unfeelingly abandoned her country and her huſband; and having tranſported her moſt valuable treaſures within the walls of Troy, defied the reſentment of Greece, and the vengeance of heaven.

Menelaus, diſtracted and enraged, now called for the ſtipulated aſſiſtance of his ancient rivals; and his demands were enforced by the authority of Agamemnon. At the ſummons of the two brothers, the confederates aſſembled at Ægium, the capital of Achaia; confirmed the obligation of their former promiſe; ſettled the proportion of troops to be raiſed by each prince; determined the time and place of their departure; and named Agamemnon to the chief command. Aulis, a ſea-port of Bœotia, was appointed for the place of embarkation. But before the armament ſailed from thence, Ulyſſes king of Ithaca, and the injured Menelaus, undertook a ſolemn embaſſy to Troy, in order to demand reſtitution and reparation; but they returned highly diſguſted with their reception and illiberal treatment. Some of the Trojan council had the audacity to propoſe putting them to death. Their juſt indignation increaſed the warlike ardour of their aſſociates: but contrary winds long retarded their departure. The Trojans had time to ſtrengthen their ramparts, to collect arms and proviſions, and to ſummon the aſſiſtance of their diſtant allies. The martial ſpirit of the age brought many powerful auxiliaries to Priam. His cauſe was defended by the hardy mountaineers, who covered the back of his kingdom; by the Carians, Lycians, and other nations of Aſia Minor, extending from the mouth of the river Halys to the ſouthern extremity of Cilicia; and by the Pelaſgi, Thracians, and Pæonians, barbarians who inhabited the European ſide of the Helleſpont and Propontis. The debarkation of the Greeks was purchaſed by much blood. Having effected a deſcent, they encamped on the Trojan plain, in the year before Chriſt 1193; but loſt the only opportunity which at firſt preſented itſelf, of cruſhing at once the power of their enemies; who immediately ſhut themſelves up within their impenetrable walls, leaving the city open only on the ſide of mount Ida, from which they received corn, cattle, and other neceſſary ſupplies.

Agamemnon had been more induſtrious in collecting a great army, than provident in contriving means by which it might keep the field. The proviſions were ſpeedily conſumed, while the operations of the ſiege promiſed little hopes of ſucceſs, the Greeks being unacquainted with any military engines fitted to make an impreſſion on the Trojan walls. Nine ſummers and winters elapſed, without affording any proſpect of a deciſion to the conteſt; but, in the tenth year of the war, the Greeks precipitated the downfal of the city. A dreadful peſtilence had invaded the camp of the beſiegers, and long continued to rage with unabating fury. This calamity was followed by the ill-timed quarrel between Agamemnon and Achilles, which deprived the Grecian army of its principal hero. The Trojans derived new ſpirits from theſe contentions among their enemies; they ventured to abandon the protection of their walls; they boldly aſſailed the Grecian camp, and riſked ſeveral engagements, in moſt of which they were victorious. In the laſt of theſe, Patroclus, the beloved friend of Achilles, was ſlain by Hector, the braveſt of the Trojan race. This event, which was infinitely more dreadful than death to the affectionate ardour of Achilles, ſtifled his hitherto inexorable reſentment againſt the tyranny of Agamemnon. His return to the camp reſtored the declining fortune of the Greeks; and the indignant fury of his rage could only be quenched by the blood of Hector, whoſe patriotic valour was the chief bulwark of his father's kingdom. The deſtruction of Troy ſoon followed the death of this hero. The city, whether taken by ſtorm, or by ſtratagem, was ſet on fire in the night; moſt of the citizens periſhed by the ſword, or were dragged into captivity; and a remnant only eſcaped through the confuſed horror of raging flames and expiring kinſmen.

The deſtruction of Troy happened eleven hundred and eighty-four years before the birth of Chriſt. Neither the city nor territory ever aſſumed, in any ſucceeding age, the dignity of independent government. The ſea-coaſt was planted eighty years after the Trojan war, by new colonies from Greece; and the inland parts ſubmitted to the growing power of the Lydians, whoſe arms overſpread and conquered all the fineſt provinces of Leſſer Aſia. The Greeks recovered poſſeſſion of the admired Helen; they had taken complete vengeance on the family and nation of her ſeducer; but the misfortunes which were the conſequence of the Trojan expedition, left them little reaſon to boaſt of their victory. Of five Bœotian commanders, only one remained; and the ſiege had been proportionably fatal to the leaders of other tribes, as well as to their followers. Thoſe who lived to divide the rich ſpoils of Troy, were impatient to ſet ſail with their newly-acquired treaſure, notwithſtanding the threatening appearance of the ſkies. Many of them periſhed by ſhipwreck; others were long toſſed on unknown ſeas; and when they expected to find in their native country a happy termination of their calamities, they were expoſed to ſuffer greater misfortunes there, than any which they had yet endured. The thrones of ſeveral of the abſent princes had been uſurped by violence and intrigue; the lands of various communities had been occupied by the invaſion of hoſtile tribes: even the leaſt unfortunate of thoſe adventurers found their domains uncultivated, or their territories laid waſte; their families torn by diſcord, or their cities ſhaken by ſedition. And thus the moſt celebrated enterpriſe of the combined provinces of Greece, tended to plunge that delightful country into barbariſm and miſery.

Thus Greece triumphed over Troy; but it was a melancholy triumph. The victorious Agamemnon had ſcarcely ſet foot on his native land, when he was cut off by an adulterous ſpouſe and a perfidious aſſaſſin. His ſon Oreſtes found protection in Athens againſt the reſentment of an uſurper. In the eighth year of his exile he returned with his partiſans, and took ample vengeance on the unfeeling Egyſtheus and Clytemneſtra. He reigned in Argos, but with far leſs glory than his father; nor did that kingdom ever again aſſume its ancient pre-eminence. The wanderings and the

the woes of Ulyſſes, which alike reſulted from this famous ſiege, are too well known to be deſcribed here. His patient fortitude regained him the kingdom of Ithaca; but not without wading through the blood of his moſt illuſtrious ſubjects. Had hiſtory minutely recorded the domeſtic feuds which prevailed in other ſtates, it would probably exhibit a diſguſting picture of fraud and cruelty, offenſive to humanity, and derogatory to the human character. Suffice it to ſay, that during the four following centuries, viz. from the year 1184, to 775, before Chriſt, the fatal effects of the Trojan war appear to have plunged the affairs of Greece into much diſtreſs and obſcurity, and to have occaſioned many and conſiderable migrations.

In the year 1104 B. C. a moſt extenſive migration totally changed the affairs of the Peloponneſus; and, in its conſequences, gave new inhabitants to the whole weſtern coaſt of Aſia Minor. The rival families of Perſeus and Pelops anciently contended for the dominion of the Grecian peninſula. The fortune of the Pelopidæ prevailed; but their ſuperiority led them rather to perſecute, than to forgive, their enemies. The deſcendants and partiſans of Hercules, the moſt illuſtrious hero of the Perſeid line, were diveſted of their poſſeſſions, and driven into baniſhment. The exiles were firſt received by the Athenians, whoſe more humane or more enlarged policy, rendered Attica, ever ſince the reign of Theſeus, the ordinary reſource of the miſerable. Their leader Hyllus was afterwards adopted by Epalius, the aged king of Doris; and the death of their benefactor ſoon made the Heracleidæ maſters of that mountainous province. But the wilds of Oeta and Parnaſſus were little fitted to ſatisfy men, whoſe anceſtors had enjoyed far more valuable poſſeſſions. Inſtructed by paſt miſcarriages, Temenus, Creſphontes, and Ariſtodemus, deſcendants in the fifth degree from Hercules, finally abandoned the hopeleſs deſign of entering the Peloponneſus by land; but determining to uſe every exertion for regaining their hereditary eſtabliſhments, they ſet themſelves, with great induſtry, to prepare tranſports in a convenient harbour, at the northern extremity of the Corinthian gulph, which, in conſequence of this tranſaction, received, and thenceforth retained, the name of Naupactus. The warlike and rapacious Ætolians, whoſe leader Oxylus was nearly related to the family of Hercules, readily aſſiſted their labours with a view to ſhare the booty that might accrue from the expedition. The Dorians, who inhabited the neighbourhood of Mount Pindus, cheerfully deſerted the gloomy ſolitude of their woods, in order to ſeek poſſeſſions in a more cultivated country. Animated by theſe reinforcements, the Heracleidæ redoubled their diligence. All neceſſary preparations were made for the invaſion; and, before ſetting ſail, they judiciouſly detached a body of light armed troops, whoſe appearance at the iſthmus drew the ſtrength of the enemy towards that quarter. Meanwhile their armament was carried by a favourable gale towards the eaſtern coaſt of Peloponneſus. The Heracleidæ landed their followers without oppoſition, and aſſailed the defenceleſs territories to which they had long laid claim, comprehending the whole peninſula, except the central province of Arcadia, and the maritime diſtrict of Achaia. The five other provinces were conquered at the ſame time, though by different means. Laconia was betrayed to the invaders; Argos acknowledged their authority; Corinth, Elis, and Meſſenia, ſubmitted to their arms. The revolution was complete, and effected with little bloodſhed, but not without great oppreſſion of the ancient inhabitants, many of whom were reduced to ſlavery.

The Heracleidæ, agreeably to the cuſtom of that age, divided their new acquiſitions by lot. The kingdom of Argos fell to the ſhare of Temenus; Creſphontes obtained Meſſenia; and, as Ariſtodemus then happened to die, Laconia was ſet apart for his infant ſons, the twin-brothers, Euryſthenes and Procles. Corinth was beſtowed on their kinſman Aletes; and Elis given to Oxylus, their Ætolian ally. The diſtribution, however, referred only to the royal dignity, then extremely limited, and to an appropriated domain to the ſeveral princes in their reſpective allotments. The reſt of the territory was divided among the warlike Dorians and Ætolians, who had conquered for themſelves, not for their leaders; and who, having over-run, without oppoſition, the fineſt provinces of the Peloponneſus, would not return to lead a life of hardſhip and miſery on their native mountains.

Before this important revolution, Argos and Lacedæmon were ſubject to Tiſamenus, grandſon of Agamemnon; Meſſenia was governed by Melanthus, a deſcendant of the celebrated Neſtor. Theſe princes had not ſo far degenerated from the glory of their anceſtors, as to ſubmit to become ſubjects in the countries where they had long reigned. On the firſt falſe alarm of invaſion occaſioned by the appearance of light troops at the iſthmus, Tiſamenus and Melanthus had taken the field with the flower of the Argive and Meſſenian nations. But while they prepared to repel the expected inroads from the north, they received intelligence that their kingdoms had been attacked on another ſide, on which they thought them ſecure. Inſtead of returning ſouthward to diſpoſſeſs the Heracleidæ, an enterpriſe too daring to afford any proſpect of ſucceſs, Tiſamenus turned his arms againſt the Ionians, who inhabited the ſouthern ſhore of the Corinthian gulph. An obſtinate battle was fought, which proved fatal to Tiſamenus; but his followers obtained a deciſive victory, and, having expelled or enſlaved the ancient inhabitants, took poſſeſſion of that valuable province, ſo famous in later times under the name of Achaia. Melanthus enjoyed better fortune. Accompanied by his faithful Meſſenians, he reſorted to Attica, then engaged in war with the neighbouring kingdom of Bœotia. The Bœotian prince propoſed to decide the conteſt by ſingle combat. Thymætes, though deſcended from the heroic Theſeus, declined the challenge. Melanthus accepted it, prevailed in the conflict, and the ſceptre of the depoſed Thymætes was his reward.

The fermentation occaſioned in Greece by ſo many expulſions and migrations, expanded itſelf through the iſlands and coaſts of Aſia Minor. Many Peloponneſian fugitives, who beheld with indignation the calamities inflicted on their country, flocked to the ſtandard of Penthilus, a younger brother of Tiſamenus, who had taken refuge in Eubœa. Others followed the banners of Cleues and Melaus, alſo deſcendants of Agamemnon. The partizans of all theſe princes having unſucceſsfully traverſed the northern parts of Greece in queſt of new ſettlements, finally yielded to the dictates of their enterpriſing ſpirit, and, in the year before Chriſt 1096, croſſed the Helleſpont eighty-eight years after the taking of Troy, and eſtabliſhed themſelves along the ſhore of the ancient kingdom of Priam. They gradually diffuſed their colonies from Cyzicus on the Propontis to the mouth of the river Hermus; which delightful country, together with the iſle of Leſbos, thenceforth received the name of Eolis or Eolia, to denote that its inhabitants belonged to the Eolian branch of the Hellenic race.

Conſequences ſtill more important reſulted from the expulſion of the Achæans by the followers of Tiſamenus. The ancient inhabitants of Achaia, being themſelves Ionians, took refuge with their kinſmen in Attica. The Meſſenian fugitives under Melanthus had ſought protection in the ſame country. The Athenians readily accepted theſe new acceſſions of ſtrength, being inſpired with a well-founded jealouſy of the Dorian conquerors of Peloponneſus, whoſe ambition early produced that memorable rivalſhip between the Doric and Ionic race, which ſubſiſted to the lateſt times of the Grecian

Grecian republics. In the reign of Codrus, before Chriſt 1089, the Dorians had encroached on the Athenian frontier, and ſeized the territory of Megara, on the northern coaſt of the Saronic gulph. Iſſuing from their ſtrong holds in that rocky diſtrict, from which it was long impoſſible to diſlodge them, they haraſſed the Athenians in a cruel war, concerning which a ſuperſtitious rumour prevailed, that they ſhould finally remain conquerors, provided they abſtained from injuring the perſon of the Athenian king. Codrus, hearing the report, was inſpired with the ſpirit of heroiſm congenial to his family. Diſguiſing himſelf in the habit of a peaſant, he proceeded to the quarters of the enemy; inſulted a Dorian ſoldier; a combat enſued; Codrus fell; his body was recogniſed; and the ſuperſtitious Peloponneſians, now deſpairing of ſucceſs, ſuſpended their hoſtilities. The inimitable merit of a prince, who had devoted himſelf to death for the ſafety of his country, furniſhed the Athenians with a pretence for aboliſhing the royal authority. None of the human race, they declared, was worthy to ſucceed Codrus; and none but Jupiter ſhould thenceforth reign in Athens. Medon, the eldeſt ſon of that admired prince, was appointed firſt magiſtrate of the republic under the humbler title of archon. His brothers, Neleus, and Androclus, probably diſſatisfied with theſe tranſactions, determined to leave their country. Their deſign was approved by the Achæan and Meſſenian refugees, and by many Athenian citizens, who complained that Attica was too narrow and barren to maintain the increaſing numbers of its inhabitants. The reſtleſs ſpirits in Phocis, Bœotia, and other neighbouring provinces, eagerly joined the emigrants. They ſailed to Aſia Minor, expelled the ancient inhabitants, a mixed race of Lydians, Carians, and Pelaſgi, and in the year before Chriſt 1055, ſeized the central and moſt beautiful portion of the Aſiatic coaſt. Their colonies were gradually diffuſed from the banks of the Hermus to the promontory of Poſideion. They afterwards took poſſeſſion of Chios and Samos; and all theſe countries were united by the common name of Ionia, to denote that the Ionians compoſed the moſt numerous diviſion of the colony.

During the ſame turbulent ages, inteſtine ſedition, foreign invaſion, or the reſtleſs ſpirit of adventure and rapine, occaſioned other important extenſions of Grecian colonization. The moſt numerous colonies occupied the iſles of the Ionian and Ægean ſeas, the ſouthern coaſt of Italy almoſt interſected by the former, and the winding ſhores of Aſia Minor ſo beautifully diverſified by the latter. The larger iſlands of Sicily, Sardinia, and Cyprus, were very anciently planted by Greeks. While the Hellenic ſtock puſhed forth theſe vigorous ſhoots towards the eaſt and weſt, very conſiderable branches extended towards the north and ſouth. The maritime parts of Epirus, Macedonia, and Thrace, themſelves abounding in Greek ſettlements, poured forth new colonies along the European ſhores of the Propontis and the Euxine: and emigrants from the Peloponneſus having early eſtabliſhed themſelves on the oppoſite coaſt of Africa, were gradually diffuſed from the confines of Egypt to the Syrtic gulph.

The Aſiatic Greeks, whoſe affairs firſt became intimately connected with thoſe of the mother country, received a conſiderable acceſſion of ſtrength in conſequence of the renewal of hoſtilities between the Athenians and Dorians. The latter were finally expelled from many of their ſtrong holds in Megara. Diſdaining after this misfortune to return into the Peloponneſus, many of them ſailed to the iſlands of Rhodes and Crete, already peopled by Doric tribes; while others tranſported themſelves to the peninſula of Caria, which, in honour of their mother country, A. C. 944, received the name of Doris.

In conſequence of this eſtabliſhment, which was formed two hundred and forty years after the Trojan war, the weſtern coaſt of Aſia Minor was planted by the Eolians in the north, the Ionians in the middle, and the Dorians in the ſouth. Theſe original diviſions of the Hellenic race retained in their new ſettlements the peculiarities of accent and dialect, by which they had been reſpectively diſtinguiſhed in Europe; and which, at the time of their ſeveral emigrations, prevailed in Bœotia, Attica, and Lacedæmon. The Bœotians, and Lacedæmonians, who claimed the firſt honours, the one of the Eolic, and the other of the Dorian, name, adhered, with little variation, to their ancient dialects: but the Athenians, more ingenious, made ſuch conſiderable alterations in their writing and pronunciation, as remarkably diſtinguiſhed them from their Ionian brethren; thus the ſame language came to be modified into four ſubdiviſions, or dialects, and diſtinguiſhed four ſtates or kingdoms, which roſe out of the ruins of the heroic age, or reſulted from the ſiege of Troy.

During the prevalence of thoſe generous though romantic opinions, which characteriſed the heroic ages, the authority of kings was founded on religion, ſupported by gratitude, and confirmed by utility. While they approved themſelves worthy miniſters of heaven, they were entitled to due and hereditary honours; but in the exerciſe of the regal office, they were bound to reſpect the rights, the ſentiments, and even the prejudices, of their ſubjects. The fatal dictates of ambition and avarice led them to tranſgreſs the preſcribed limits, and to trample on thoſe laws which their predeceſſors had held ſacred. The minute diviſion of landed property which had taken place, rendered the nobles and people more ſenſible of theſe encroachments, which they muſt at once boldly reſiſt, or ſubmit for ever to the yoke of oppreſſion. Reduced to this alternative, the Greeks were inclined by diſpoſition, and enabled by ſituation, to prefer and to maintain the moſt honourable part. The prerogatives of royalty were not as yet ſupported by the excluſive right of the ſword, by which a particular claſs of men might intimidate and controul the reſolutions of their fellow-ſubjects. The more independent and illuſtrious citizens, who had been accuſtomed from the earlieſt times to come armed to the council or aſſembly, communicated their grievances, and took proper means to remove them. Miltas, the fourth Argive prince in ſucceſſion to Temenus, was condemned to death for uſurping abſolute power. Monarchy expired more honourably in Attica; it periſhed ſtill more diſgracefully in Arcadia, but was gradually aboliſhed in every province of Greece, except Sparta alone, from the ſouthern extremity of Peloponneſus to the northern frontier of Theſſaly. The conſequences of this revolution, ſerved only to multiply the grievances which it was deſigned to remedy. Greece, oppreſſed by its kings, was ſtill more oppreſſed by its archons, or magiſtrates; and, already too much divided under the ancient government, was ſtill more ſubdivided under the new form of polity. Many inferior cities diſdained the juriſdiction of their reſpective capitals. Each town maintained war with its neighbours; and every concomitant evil began to fall upon the diſtracted country. From theſe accumulated diſorders, the people were at length to be preſerved through the ſalutary influence of the Amphictyonic council. In the northern parts of Greece, this inſtitution, which had been originally intended to prevent foreign invaſion, had been found equally uſeful in promoting domeſtic concord. The Dorians, being conſtituent members of the council, continued to attend its meetings after they had ſettled beyond the mountainous iſthmus of Corinth. The provinces which they conquered gradually aſſumed the ſame privilege. The Amphictyons thus became a repreſentative aſſembly of the whole Grecian name, conſiſting not only of the three original tribes of Ionians, Dorians, and Eolians, but of the ſeveral ſubdiviſions of theſe tribes, and of the

various communities formed from their promiſcuous combination. Each independant ſtate had a right to ſend two members, the Pylagoras and Hieromnemon, reſpectively entruſted with the civil and religious concerns of their conſtituents. The abolition of royalty rendering the independent communities more numerous, increaſed the Amphictyons to about an hundred perſons. The central city of Delphi was choſen as a convenient place for holding their vernal aſſembly; the autumnal was ſtill held at Thermopylæ. An oath, guarded by the moſt ſolemn imprecations, was adminiſtered to each member, "that he would never ſubvert any Amphictyonic city, nor ſtop the courſes of its running water, but puniſh to the utmoſt of his power thoſe who committed ſuch outrages." Hence this reſpected tribunal, though it was deficient in coërcive power, had a conſiderable effect to ſuppreſs internal diſcord, and reſtrain the barbarities of war.

The Amphictyons gained much conſideration by declaring themſelves protectors of the Delphic oracle, which had acquired an extraordinary influence on the affairs of Greece. It is ſeldom poſſible to explain the riſe of inſtitutions derived from the natural paſſions of men, or founded on prejudices as ancient as the world. The moſt probable information concerning the origin of Grecian oracles was conveyed to Herodotus, in a thin allegorical veil, by the prieſts of Dodona, and explained to that inquiſitive traveller by the prieſts of Jupiter in Egypt. In the allegorical ſtyle of antiquity, a black pigeon flew from the temple of Egyptian Thebes, to Theſprotia in Epirus, perched on a ſpreading oak, proclaimed with a human voice, that an oracle of Jupiter ſhould be eſtabliſhed; and the inhabitants of the neighbouring hamlet of Dodona obeyed the divine admonition. In plain language, it was a female attendant belonging to the temple of Thebes on the Nile, who was tranſported to Epirus by Phœnician pirates, and there ſold as a ſlave. Her Egyptian complexion deſerved the epithet of *black* among the mountaineers of Theſprotia, who were remarked by the Greek hiſtorians for their blooming complexions, active vigour, and longevity. She was ſaid to ſpeak the languages of birds, before ſhe underſtood the Grecian tongue, often diſtinguiſhed by the appellation of human ſpeech. This enterpriſing female, though reduced to captivity among thoſe whom ſhe muſt have regarded as barbarians, did not yield to deſpair, but dexterouſly availed herſelf of the advantages which ſhe derived from her education and her country. In Egypt, ſuperſtition had been reduced into ſyſtem; and a pretenſion to prophecy was one of the moſt ſucceſsful artifices by which the prieſts of Thebes long governed the reſolutions both of prince and people. Her attendance on the temple had taught her ſome of the arts by which this pretenſion was maintained. She choſe the dark ſhade of the venerable oak; delivered myſterious anſwers to the admiring multitude; her reputation increaſed; ſucceſs gained her aſſociates; a temple roſe to Jupiter, and was ſurrounded by houſes for his miniſters. This ſingular inſtitution was imitated, at a very early period, in many provinces of Greece. The various and inconſiſtent accounts of ſimilar eſtabliſhments abundantly confirm the antiquity of their origin, and the multiplicity of temples, groves, grottos, and caverns, in which the favourites of innumerable divinities declared their will to men, proves them not leſs univerſal than ancient. During the heroic age, indeed, as illuſtrious and pious men believed themſelves, on important occaſions, honoured with the preſence and advice of their heavenly protectors, the ſecondary information of prieſts and oracles was leſs generally regarded and eſteemed. But in proportion as the belief ceaſed that the gods appeared in a human form, or the ſuppoſed viſits of theſe celeſtial beings ſeemed leſs frequent and familiar, the office of prieſt became more reſpectable, and the confidence in oracles continually gained ground. At length, theſe inſtitutions, being conſidered as the chief and almoſt only mode of communication with ſupernatural powers, acquired a degree of influence capable to controul every other principle of authority, whether civil or ſacred. But theſe various oracles, though alike founded on ignorance, and raiſed by deceit, were not equally ſupported by power and policy. The crafty Cretans, who inſtituted the worſhip of the Delphian Apollo, gradually procured the credit of ſuperior veracity to the predictions of the god whom they ſerved. Favourable circumſtances concurred; the central ſituation of Delphi; the vernal ſeſſion of the Amphictyons; the luſtre derived from the immediate protection of that aſſembly; above all, the uncommon and awful aſpect of the place itſelf, fitted to excite wonder in ages leſs addicted to ſuperſtition. See the article DELPHI, vol. v. p. 681.

The ſubſequent hiſtory of Greece atteſts the important influence of the Delphic oracle, which no ſooner attained ſplendour, than it confirmed, by its powerful ſanction, two inſtitutions, the firſt religious, the ſecond civil, and both accompanied with very extraordinary conſequences. The Olympic games, and Spartan laws, were reſpectively eſtabliſhed by Iphitus and Lycurgus, contemporaries, friends, both animated by the true ſpirit of patriotiſm, and unqueſtionably the moſt illuſtrious characters of the age in which they lived; yet the roads which they purſued for reaching the ſame goal, the ſafety of their reſpective territories, were ſo widely different, that, while the Olympic games rendered Elis the moſt pacific, the laws of Lycurgus made Sparta the moſt warlike, of all the Grecian communities.

It was held an ancient and ſacred cuſtom, in the heroic ages, to celebrate the funerals of illuſtrious men by ſuch ſhows and ceremonies as ſeemed moſt pleaſing to their ſhades. The tombs, around which the melancholy manes were ſuppoſed to hover, naturally became the ſcene of ſuch ſolemnities. There the fleeting ghoſts of departed heroes were entertained and honoured by exhibitions of ſtrength and addreſs; while the gods, though inhabiting the broad expanſe of heaven, were yet peculiarly worſhipped, by prayers and ſacrifices, in the ſeveral places, which ſometimes the wildneſs, and ſometimes the elegance of fancy, had aſſigned for their favourite, though temporary, reſidence on earth. The lofty chain of Olympus, ſeparating the barbarous kingdom of Macedon from the fertile plains of Theſſaly, is diſtinguiſhed by ſeveral circumſtances, which ſeemed juſtly to entitle it to that honour. This long and lofty ridge aſcends above the regions of ſtorms and tempeſts. Its winding ſides are diverſified by woods, and interſected by torrents. Its fantaſtic tops, towering above the clouds, reflect, during day, the rays of the ſun, and ſometimes brighten the gloom of night with the lambent ſplendours of the Aurora Borealis. This extraordinary mountain began naturally to be regarded as the principal terreſtrial habitation of the gods; along the receſſes of Olympus each divinity had his appropriate palace; on its higheſt ſummit Jupiter often aſſembled the heavenly council; and from thence, veiled in a white gleam, the protectors of mankind deſcended, and were viſibly manifeſted to mortal eyes.

While Olympus was conſidered as the general rendezvous of theſe fanciful beings, it was natural to imagine that the partiality of particular divinities might ſelect other favourite ſpots of the earth for their ſeparate abode. The ſingular aſpect of Delphi, or Pytho, which recommended it as the ſeat of the oracle of Apollo, and afterwards of the Pythian games, was under the ſame influence. The Corinthian territory was particularly conſecrated to Neptune; for where could the god of the ſea be more properly worſhipped, than on a narrow iſthmus, whoſe ſhores were adorned by grateful mo-

numents of delivered mariners, and which had continued, from early times, the principal centre of Grecian navigation?

A tradition had long prevailed, that the fruitful and picturesque banks of the Alpheus, in the province of Elis, or Eleia, had been consecrated to Jupiter. It is certain that athletic sports, similar to those described by Homer at the funeral of Patroclus, had been on many occasions exhibited in Elis, by assembled chiefs, with more than ordinary solemnity. The Dorian conquerors are said to have renewed the consecration of that delightful province. But the wars which early prevailed between them and the Athenians, and the jealousies and hostilities which afterwards broke out among themselves, totally interrupted the religious ceremonies and exhibitions with which they had been accustomed to honour their common gods and heroes. Amidst the calamities which afflicted or threatened the Peloponnesus, Iphitus, a descendant of Oxylus, to whom the province of Eleia had fallen in the general partition of the peninsula, applied to the Delphic oracle. The priests of Apollo, ever disposed to favour the views of kings and legislators, answered agreeably to his wish, that the festivals anciently celebrated at Olympia, on the Alpheus, must be renewed, and an armistice proclaimed for such states as were willing to partake of them, and desirous to avert the vengeance of heaven. Fortified by this authority, and assisted by the advice of Lycurgus, Iphitus took measures, not only for restoring the Olympic solemnity, but for rendering it perpetual. The injunction of the oracle was speedily diffused through the remotest parts of Greece, by the numerous votaries who frequented the sacred shrine. The armistice was proclaimed in Peloponnesus, and preparations were made in Eleia for exhibiting shows and performing sacrifices. In the heroic ages, feats of bodily strength and address were destined to the honour of deceased warriors; hymns and sacrifices were reserved for the gods. But the flexible texture of Grecian superstition, easily confounding the expressions of respectful gratitude and pious veneration, enabled Iphitus to unite both in his new institution.

The festival, which lasted five days, began and ended with a sacrifice to Olympian Jove. The intermediate time was chiefly filled up by the gymnastic exercises, in which all freemen of Grecian extraction were invited to contend, provided they had been born in lawful wedlock, and had lived untainted by any immoral stain. The preparation for this part of the entertainment was made in the gymnasium of Elis, a spacious edifice, surrounded by a double range of pillars, with an open area in the middle. Adjoining were the various apartments, containing baths, and other conveniences for the combatants. The neighbouring country was gradually adorned with porticoes, shady walks and groves, interspersed with seats and benches, the whole originally destined to relieve the fatigues and anxiety of the candidates for Olympic fame; and frequented, in later times, by sophists and philosophers, who were fond to contemplate wisdom, and communicate knowledge, in those delightful retreats. The order of the athletic exercises was established by Lithurgus; Iphitus, we are told, appointed the other ceremonies and entertainments; settled the regular return of the festival at the end of every fourth year, in the month of July; and gave to the whole solemnity that form and arrangement, which it preserved with little variation above a thousand years; a period exceeding the duration of the most famous kingdoms and republics of antiquity.

From the LEGISLATION of LYCURGUS to the TERMINATION of the MESSENIAN, and FIRST SACRED WAR.

At the period when Lycurgus proposed his celebrated laws, which were universally admired, but never imitated, Greece presented a gloomy picture of domestic discord. The elevated, though romantic, sentiments of antiquity had ceased to prevail; the character of the heroic age was effaced; and the generous protection of the virtuous and the brave had given way to violence and ambition. Each petty prince was desirous to exalt his prerogative, and to extend his dominions; whilst the resistance of his subjects counteracted his usurpations. Thus every city was torn by a double conflict, and new dangers surrounded the people on every side. During these tumultuary scenes, Lycurgus, of the line of Procles, and commonly reckoned the tenth in descent from Hercules, received the Spartan sceptre upon the death of his elder brother Polydectes: but the widow of Polydectes declaring herself pregnant, he resigned the crown, and assumed the title of Protector. This delicate attention to justice, rare in any age, excited just admiration for Lycurgus, which was enhanced by contrast. The ambitious princess, more solicitous to preserve the magnificence of a queen, than desirous to know the tender cares of a mother, secretly intimated to the Protector, that, if he consented to marry her, she would engage that no posthumous son of his brother should disappoint him of the succession. Lycurgus feigned to enter into this unnatural project, but exhorted her not to endanger her health by procuring an abortion. When her delivery drew near, he sent trusty persons to attend her, with orders that, if she brought forth a son, the infant should be immediately carried to him. This command was obeyed, while he supped with the principal magistrates of the republic. He received the child in his arms, saying, "Spartans, a king is born to you!" Joyous congratulations followed, to commemorate which, the infant was named Chaerelaus, "the people's joy." Notwithstanding the fame redounding to Lycurgus from this transaction, the intrigues of the slighted queen raised a powerful faction against him. He withdrew himself from the gathering storm; and, being yet in early manhood, resolved to visit foreign countries.

The renowned island of Crete first attracted his regard. The Cretans still partially adhered to the laws of Minos; but their island never resumed its pristine lustre after the war of Troy. From Crete he sailed to Egypt, and carefully examined the civil and religious polity of that ancient and learned kingdom. Despising the terrors of the sea, as well as the fatigues and dangers of unexplored journies through barbarous or desert countries, he is said to have reached the populous and flourishing kingdoms of the East: nor, could we trust the partial evidence of his countryman Aristocrates, did the remote provinces of India escape his observation. He returned by the coast of Asia Minor, and observed with astonishment and satisfaction, the innumerable Greek colonies that had risen with sudden splendour on the western coast of that luxuriant peninsula. The numerous advantages derived from this extensive view of men and manners, moulded by such a wide variety of religious, political, and military, institutions, were all eclipsed by one discovery—the immortal poems of Homer, unknown to the Dorian conquerors of Peloponnesus, but carefully preserved among the Eolians and Ionians, whose ancestors they celebrated. Lycurgus collected these invaluable compositions; arranged the several parts; transcribed and transported them to Sparta, where, after two centuries of wars and revolutions, the customs as well as the sentiments described by that divine poet, had been obliterated and forgotten.

The sagacity of Lycurgus in thus contemplating the relations and interests of his country, regarded martial spirit and political liberty as the great ends of his new legislation. His immediate determination was, to extinguish the ambition of distant or extensive conquest, to level the inequality of fortune, to crush the baneful effects

LYCURGUS.

London. Published as the Act directs. March 14th 1807. by J. Wilkes.

effects of wealth and luxury, to arreſt the progreſs of what is called the refinement, but what ſeemed to the manly diſcernment, of this legiſlator, the corruption of human ſociety. To form ſuch a deſign was the work of no vulgar mind; to carry it into execution required the moſt ſtrenuous exertions of perſeverance and courage. Yet, even at this diſtance of time, we may diſcover ſeveral favourable circumſtances, which ſeaſonably conſpired with the views of Lycurgus; we may diſcover in the gradual diſplay of his ſyſtem, how the firſt inſtitutions naturally paved the way for thoſe which ſucceeded them; and while we admire the genius and the virtue, we muſt alſo acknowledge the dexterity and the fortune, of the Spartan legiſlator.

But no propitious circumſtances, nor the merit of ten years travel in purſuit of moral ſcience and political knowledge, nor the ties of blood, of friendſhip, and of gratitude, which confirmed the influence of Lycurgus among the principal inhabitants of Sparta, could have enabled this great man to eſtabliſh his plan of government, without the friendly co-operation of the Delphic oracle; which, ſince the decay of the heroic opinions and belief, had become the ſovereign umpire of Greece. The Pythia or prieſteſs addreſſed him in terms of the higheſt reſpect; heſitated whether to call him a god or a man, but rather deemed him a divinity; approved the general ſpirit of the inſtitutions which he propoſed to eſtabliſh; and promiſed to furniſh him, as occaſion might require, with ſuch additional regulations as would render the republic happy and immortal. Fortified by this authority, Lycurgus proceeded with a ſkilful hand, firſt, to new-model the government; ſecondly, to regulate wealth and poſſeſſions; thirdly, to reform education and manners; judiciouſly purſuing this natural order of legiſlation, becauſe men are leſs jealous of power than tenacious of property, and leſs tenacious of property itſelf than of their ancient uſages and cuſtoms.

The firſt laws which he eſtabliſhed, tended to reſtore the mild form of government which diſtinguiſhed the heroic age. They confirmed hereditary honours, but aboliſhed the deſpotiſm, of kings: they enforced dutiful obedience, but vindicated the liberty of the ſubject. Of the reigning princes, Chaerelaus owed to Lycurgus his throne and his life, and Archelaus deemed it dangerous to oppoſe his projects. Inſtructed by the fatal experience of neighbouring tyrants, they were eaſily prevailed on to prefer a limited to an abſolute reign. The ſuperſtition of the people could not decline the authority of the legiſlator, when confirmed by the oracle of Apollo; and the intereſt of the nobles engaged them unanimouſly to promote his meaſures. With this illuſtrious body, conſiſting of twenty-eight chiefs, the moſt diſtinguiſhed in the tribes and cities of Laconia, Lycurgus conſulted by what means to prevent the political diſſenſions from ſettling in the deſpotiſm of kings, or in the inſolence of democracy. By his new regulations the ancient honours of the nobility were confirmed and extended. They were formed into a permanent ſenate, which examined all matters of government before they were propoſed to the deliberation of the people. The kings were entitled, as in the heroic age, to be the hereditary preſidents of this national tribunal; which, as in all important queſtions it poſſeſſed a negative before debate; as the members were choſen for life; and as, on the deceaſe of any ſenator, his ſon or neareſt kinſman was naturally ſubſtituted in his ſtead; might have ſoon arrogated to itſelf the whole legiſlative as well as executive authority.

In order to counteract this dangerous tendency, Lycurgus inſtituted the Ephori, five annual magiſtrates, inveſted with a temporary power to inſpect and controul the adminiſtration of government, and to maintain the ſpirit and vigour of the eſtabliſhed conſtitution. To the Ephori it belonged to convoke, prorogue, and diſſolve, the greater and ſmaller aſſemblies of the people; the former compoſed of nine thouſand Spartans, inhabitants of the capital; the latter of thirty thouſand Lacedæmonians, inhabitants of the inferior towns and villages. By frequently convening ſuch numerous bodies of men, who had arms in their hands, they rendered them ſenſible of their own ſtrength. The Lacedæmonians felt themſelves entitled not only to execute the juſt, but to thwart the unjuſt, orders of the ſenate. Nor was their liberty endangered by the limited prerogative of the kings, who monthly exchanged with the Ephori ſolemn oaths; the former ſwearing for themſelves to obſerve the laws of Sparta, the latter for the people whom they repreſented, to maintain the hereditary honours of the Herculean race, to reſpect them as miniſters of religion, to obey them as judges in peace, and to follow them as leaders in war.

This equitable diſtribution of power was accompanied with an exact diviſion of property. At the diſtance of five centuries, it was the current tradition in Greece, that Lycurgus had totally altered the political ſtate of his countrymen, by the introduction of an agrarian law, ſimilar to that which has been ſo often, but always ſo ineffectually, propoſed in other republics, as the ſureſt foundation of liberty and happineſs. Yet the equal diviſion of lands, or, in other words, the community of landed property, and the annual partition of the harveſt, took place among the original inhabitants of Greece, as well as among the free-born warriors of ancient Germany. It may be ſuppoſed therefore, with a high degree of probability, that the Spartans, in the time of Lycurgus, ſtill preſerved ſome traces of their primitive inſtitutions, and that their minds were comparatively untainted with the vices of avarice and luxury. To bring them back, however, to the perfect ſimplicity of the heroic age, and to prevent their future degeneracy, the territory of Laconia was divided into thirty-nine thouſand portions, each producing eighty-two medimni, or buſhels, of barley, with a proportional meaſure of fruits, wine, and oil. The kings, as in the age of Homer, enjoyed their ſeparate domain, conferred by the voluntary gratitude of their ſubjects. The ſenators, contented with an increaſe of power and honour, neither obtained nor deſired any pre-eminence of fortune. Their moderation in this reſpect afforded a ſalutary example to the people, the greater part of whom would naturally be gainers by the agrarian law, while the few who were rich, ſubmitted without reſiſtance to the wiſdom of Lycurgus, and the authority of Apollo.

The equal diviſion of land ſeemed not alone ſufficient to introduce an equality in the manner of life, and to baniſh the ſeeds of luxury. The accumulation of inviſible property, might enable the rich to command the labour of the poor, and, according to the natural progreſs of wants and inventions, would encourage the dangerous purſuit of elegance and pleaſure. The precious metals had long been the ordinary meaſures of exchange in Sparta, and, could we credit a very doubtful tradition, had greatly accumulated in private hands. Lycurgus withdrew from farther circulation all this gold and ſilver, a conſiderable part of which probably repaid his obligations to the Delphic oracle, while the remainder increaſed the ſplendour of the Lacedæmonian temples. Inſtead of theſe precious metals, the Spartans received pieces of iron, which had been heated red in the fire, and afterwards quenched in vinegar, in order to render them brittle, and uſeleſs for every other purpoſe but that of ſerving as the current ſpecie. Aſtoniſhing were the effects of this operation. With the baniſhment of gold and ſilver were baniſhed all the pernicious appetites which they excite, and all the frivolous arts which they nouriſh. Neither fortune-teller, nor phyſician, nor ſophiſt, were longer to be ſeen in Sparta; gaudy trinkets and toys, and all uſeleſs finery in dreſs and furniture, at once diſappeared; and the innocence and dignity of Spartan manners correſponded with the primitive

primitive ſimplicity of the iron money. And this iron money continued permanent in Sparta alone, after the vices of wealth and luxury had polluted the reſt of Greece, and it repelled from the republic of Lycurgus the votaries of pleaſure, as well as the ſlaves of gain, and all the miſerable retinue of vanity and folly. Of what avail was abundant wealth to a people, among whom it was enjoined by the laws, and deemed honourable by the citizens, freely to communicate their arms, horſes, inſtruments of agriculture and hunting; to eat together at common and frugal tables, agreeably to the practice of the heroic age; to diſregard every diſtinction but that of perſonal merit; to deſpiſe every luxury but that of temperance; and diſdain every acquiſition but that of the public eſteem?

The univerſal aſſent to the divine miſſion of Lycurgus, excited the moſt generous and manly ſentiments in the minds of his countrymen. His laws were few and ſhort; for the ſake of memory they were conceived in verſe; they were not conſigned to writing, but treaſured in the *hearts* of his diſciples as the immediate dictates of heaven. The Lacedæmonians were ſeverely prohibited from the contagious intercourſe of ſtrangers, except at the ſtated returns of religious ſolemnities. Lycurgus, who had aſſiſted Iphitus in the Olympic games, inſtituted ſimilar, though leſs ſplendid, feſtivals in his native country. When unemployed in the ſerious buſineſs of war, the Lacedæmonians were continually engaged in aſſemblies for converſation and the gymnaſtic exerciſes, or in religious and military amuſements. Agriculture and the mechanic arts were left to the ſervile hands of ſlaves; the ſciences of war and of government were recommended by the laws of Lycurgus, as the only purſuits worthy the attention of freemen.

In the knowledge and practice of war, the Lacedæmonians excelled all the Greeks. Courage, the firſt quality of a ſoldier, was enlivened by every motive that can operate moſt powerfully on the mind, while cowardice was branded as the moſt odious and deſtructive of crimes. The Spartans preſerved the uſe of the ſame weapons and defenſive armour that had been adopted in the heroic age. Their troops were divided into regiments, conſiſting of five hundred and twelve men, ſubdivided into four companies, and each of theſe into ſmaller diviſions, commanded by their reſpective officers; for it was peculiar to the Lacedæmonian armies to contain comparatively few men not entruſted with ſome ſhare of ſubordinate command. A body of cavalry always preceded their march; ſenſible of the weakneſs of angles, they encamped in a circular form: the order of their guards and watches was highly judicious; they employed, for their ſecurity, out-ſentries and vedettes; and regularly, every morning and evening, performed their cuſtomary exerciſes. Xenophon has deſcribed with what facility they wheeled in all directions; converted the column of march into an order of battle; and, by ſkilful and rapid evolutions, preſented the ſtrength of the line to an unexpected aſſault. In the day of battle, the Spartans aſſumed an unuſual gaiety of aſpect; and diſplayed, in their dreſs and ornaments, more than their wonted ſplendour. Their long hair was arranged with elegance; their ſcarlet uniforms, and brazen armour, diffuſed a luſtre around them. As they approached the enemy, the king ſacrificed anew; the muſic ſtruck up; and the ſoldiers advanced with a ſlow and ſteady pace, and with a cheerful but deliberate countenance, to what they were taught to regard as the nobleſt effort of their lives.

But that continual exerciſe in arms, which improved the ſkill and confirmed the valour, muſt gradually have exhauſted the ſtrength of Sparta, unleſs the care of population had formed an object of principal concern in the ſyſtem of Lycurgus. Marriage was enjoined by ſome very ſingular inſtitutions; but ſtill more powerfully encouraged by extirpating its greateſt enemies, luxury and vanity. Lycurgus, not content with maintaining the populouſneſs of Sparta, endeavoured to ſupply the paſt generation with a nobler and more warlike race, and to enlarge and elevate the bodies and minds of men to that full proportion of which their nature is ſuſceptible. Of this extraordinary circumſtance, the evidence of contemporary writers could ſcarcely convince us, had they barely mentioned the fact, without explaining its cauſe. In deſcribing the ſyſtem of Lycurgus, they have not omitted his important regulations concerning the intercourſe between the ſexes, women, marriage, and children, whoſe welfare was, even before their birth, a concern to the republic. The generous and brave, it is ſaid, produce the brave and good; but the phyſical qualities of children ſtill more depend on the conſtitution of their parents. In other countries of Greece, the men were liberally formed by war, hunting, and the gymnaſtic exerciſes; but the women were univerſally condemned to drudge in ſedentary and ignoble occupations, which enfeebled both mind and body. Women, thus degraded by ſervility, appeared incapable of giving good ſons to the republic, which Lycurgus regarded as the principal duty of the Lacedæmonian females. By the inſtitutions of Sparta, therefore, the free-born women enjoyed and practiſed thoſe liberal exerciſes and amuſements, which were elſewhere conſidered as the peculiar privilege of men; they aſſiſted at the public ſolemnities, mingled in general converſation, and, like the ladies in the age of chivalry, where the principal arbiters of applauſe and reproach. Hence they became not only the companions, but the judges, of the other ſex; and, except that their natural delicacy was not aſſociated to the honours of war, they enjoyed the benefit, without feeling the reſtraint, of the Spartan laws.

This reſtoration of the natural rights of women induced moderation and modeſty in the intercourſe between the ſexes. Marriage, though enjoined as a duty, could only be contracted in the full vigour of age; and theſe ſimple inſtitutions had a more ſalutary influence on the phyſical improvement of the Spartan youth, than either the doubtful expedient of adorning the women's apartments with the fineſt ſtatues of gods and heroes, that, by frequently contemplating theſe graceful images, they might produce a fairer offſpring; or the unnatural and deteſtable cruelty of expoſing deformed children, a practice ſtrongly recommended by Lycurgus, and ſilently approved, or but faintly blamed, by the greateſt philoſophers of antiquity.

In a moral view, the character of Spartan mothers muſt have been highly beneficial to their ſons; ſince much of the happineſs of life depends on the firſt impreſſion of our tender years. When boys were emancipated from the juriſdiction of women, they were not entruſted, as in other parts of Greece, to the tuition of ſlaves, who might degrade their ſentiments, and corrupt their morals. The education of youth, as an office of the higheſt confidence, was committed to thoſe who had enjoyed, or who were entitled to enjoy, the moſt ſplendid dignities of the republic; and it was required that the maſter ſhould himſelf poſſeſs the virtues with which he undertook to inſpire his pupils. The Spartan youth were taught muſic and drawing: the former of which comprehended the ſcience not only of ſounds, but of number and quantity: they were taught to read and ſpeak their own language with graceful propriety; to compoſe in proſe and verſe; above all, to THINK; and in whatever they ſaid, even during the flow of unguarded converſation, to accommodate the expreſſion to the ſentiment. Their ſedentary ſtudies were relieved by the gymnaſtic exerciſes, the early practice of which might qualify them for the martial labours of the field. For this important buſineſs of their manhood, they were ſtill further prepared, by being enured, even in their tender

tender years, to a life of hardſhip and ſeverity. They wore the ſame garment ſummer and winter; they walked bare-footed in all ſeaſons; their diet was plain and frugal, and ſo ſparing, that they loſt no opportunity to ſupply the defect. What they were unable to take by force, they were to acquire by fraud. When their theft (if theft can be practiſed where ſeparate property is almoſt unknown) was diſcovered, they were ſeverely puniſhed; but if their dexterity eſcaped obſervation, they were allowed to boaſt of their ſucceſs, and met with applauſe for their activity, vigilance, and caution; which indicated a character fitted to excel in the future ſtratagems of war.

After attaining the ordinary branches of education, youth frequently become the maſters of their own actions. Of all practical errors, Lycurgus deemed this the moſt dangerous. His diſcernment perceived the value of that moſt important period of life, which intervenes between childhood and virility; and the whole force of his diſcipline was applied to its direction and improvement. Inſtead of being looſened from the uſual ties of authority, the Spartans, at the age of adoleſcence, were ſubjected to a more rigorous reſtraint; and the moſt extraordinary expedients were employed to moderate the love of pleaſure, to correct the inſolence of inexperience, and to controul the headſtrong impetuoſity of youthful paſſions. If the ſeeds of their vicious appetites had not been thoroughly eradicated by a life of habitual toil and temperance, they were ſubjected to corporal puniſhment, which it was their cuſtom to endure with patient fortitude. The maxims of honour were inſtilled by precept, and enforced by example. The public tables, which were frequented by all ages, ſerved as ſo many ſchools of wiſdom and virtue; where, on ordinary occaſions, but more particularly on days of feſtivity, the old related their ancient exploits, and boaſted their paſt proweſs; thoſe in the vigour of life diſplayed the ſentiments which their manly courage inſpired; and the young expreſſed a modeſt confidence that, by ſteadfaſtly adhering to the precepts of Lycurgus, they might be enabled in due time to equal, perhaps to ſurpaſs, the glory of both.

The reverence for aged wiſdom, which formed the prevailing ſentiment of the heroic times, was reſtored by the legiſlation of Lycurgus, and employed as a main pillar of his political edifice. The fears and infirmities of the old were compenſated by honour and reſpect; the hopes and vigour of the young were balanced by obedience and reſtraint. The difference of years thus occaſioned little diſproportion of enjoyment; the happineſs of every age depended on the practice of virtue; and as all adventitious and accidental diſtinctions were removed, men perceived the importance of perſonal merit, and of its reward, the public eſteem, and eagerly graſped the advantages which glory confers; the only excluſive advantages which the laws of Lycurgus permitted them to enjoy. The paternal authority, which maintained the diſcipline and promoted the grandeur of Rome, was firmly eſtabliſhed at Sparta, where every father might exerciſe an unlimited power, over not only his own, but the children of others, who were all alike regarded as the common ſons of the republic. This domeſtic ſuperiority naturally prepared the way for civil pre-eminence; the elective dignities of the ſtate were obtained only by men of experienced wiſdom; and it required ſixty years of laborious virtue to be entitled to a ſeat in the ſenate-houſe, the higheſt ambition of the Spartan chiefs. Such regulations, of which it is impoſſible to miſtake the ſpirit, had a direct tendency to produce moderation and firmneſs in the public councils, to controul the too impetuous ardour of a warlike people, to allay the ferment of domeſtic faction, and to check the dangerous ambition of foreign conqueſt. The power of the magiſtrate was confounded with the authority of the parent; they mutually aſſiſted and ſtrengthened each other, and their united influence long upheld the unſhaken fabric of the Spartan laws, which the old felt it their intereſt to maintain, and the young deemed it their glory to obey.

Such a condition of ſociety ſeems the higheſt elevation and grandeur to which human nature can aſpire. The Spartans attained, and long preſerved, this ſtate of exaltation; but ſeveral circumſtances and events, which the wiſdom of Lycurgus had foreſeen, but which no human power could prevent, undermined the foundation of their greatneſs and felicity. Their military proweſs gave them victory, ſlaves, and wealth; and though individuals could feel only the pride of virtue, and enjoy only the luxury of glory, the public imbibed the ſpirit of rapacity, and the ambition of conqueſt. As in other countries the vices of individuals corrupt the community, in Laconia the vices of the public corrupted individuals. The Spartans, however, long maintained their ſuperiority over other nations. By dividing the ſtrength, they diſarmed the fury of their enemies, and the flames of domeſtic diſcord were eclipſed by the ſplendour of foreign conqueſt, by which both the magiſtrates and the ſubjects were enriched and corrupted: yet, amidſt civil diſcord and political degeneracy, they preſerved their religious and military inſtitutions, as well as their invaluable plan of education; and their tranſactions, even in the lateſt ages of Greece, furniſh an ample and honourable commentary on the laws of Lycurgus.

Concerning this extraordinary man, only one farther circumſtance is recorded with any appearance of authenticity. Having beheld the harmony of the political machine which he had ſo ſkilfully contrived, he ſummoned an aſſembly, and declared, that now he had but one new regulation to propoſe, upon which, however, it was neceſſary he ſhould go and conſult the oracle of Delphi; that, meanwhile, his countrymen, who had ſeen the ſucceſs of his labours, would engage that no alteration ſhould take place before his return. The king, the ſenate, and the people, ratified the engagement by a ſolemn oath. Lycurgus undertook his journey; the oracle predicted the happineſs which the Spartans ſhould enjoy as long as they lived by his admirable laws. The reſponſe was tranſmitted to his country, where Lycurgus himſelf determined never more to return, convinced that the duration of the government which he had eſtabliſhed would be better ſecured by the eternal ſanctity of an oath, than by the temporary influence of his own perſonal preſence. It is ſaid that he afterwards died a voluntary death, by abſtaining from all nouriſhment.

The Lacedæmonians thus left to themſelves, ſoon entered into an obſtinate war with the Meſſenians. On the confines of Meſſenia and Lacedæmon ſtood an ancient temple of Diana, which, being erected at the common expence, was open to the prayers and ſacrifices of the two nations. Hither, according to annual cuſtom, repaired a ſelect band of Spartan virgins to ſolemnize the rites of their favourite divinity. A company of Meſſenian youths arrived at the ſame time to perform their cuſtomary devotion, and to implore the protection of the warlike goddeſs. Inflamed by the beauty of the Spartan ladies, the Meſſenian youths, after vainly attempting by the moſt ardent vows to move the inflexibility of Spartan virtue, had recourſe to violence in order to conſummate their brutal deſigns; and the deflowered victims, unwilling to ſurvive ſo intolerable a diſgrace, periſhed by their own hands.

In reſentment of this atrocious injury, the Spartans invaded the Meſſenian frontier, and attacked the ſmall town of Ampheia, in the year before Chriſt 743. The time choſen for the aſſault was the dead of night, when the unſuſpecting inhabitants repoſed in full confidence of their accuſtomed ſecurity. Many Ampheians were aſſaſſinated in their beds; ſeveral fled in vain to the altars of their gods; and but few eſcaped the ſwords of the enraged Spartans.

On this ſanguinary occaſion Euphaes, who had ſucceeded to the throne of his father Antiochus, ſummoned a general aſſembly of his countrymen to the plain of Stenyclara; where it was reſolved to abandon the open country, and ſettle in ſuch of their towns as were beſt fortified by art or nature, leaving the remainder to the invaſion of an enemy, with whoſe bravery and numbers they were not able to contend. But while they kept within the walls, they continued to exerciſe themſelves in arms, and to acquire ſuch vigour and diſcipline, as might eventually enable them to oppoſe the Spartans in the field. Four years elapſed from the taking of Ampheia before they ventured to embrace this dangerous meaſure. During all that time, the Spartans made annual incurſions into their country, deſtroying their harveſts, and carrying into captivity ſuch ſtraggling parties as they happened to ſurpriſe. The Meſſenians, on the other hand, as their courage increaſed, were not contented with defending their own walls, but detached, in ſmall parties, the boldeſt of their warriors to ravage the ſea-coaſt of Laconia. Encouraged by the ſucceſs of theſe predatory expeditions, Euphaes determined to take the field with the flower of the Meſſenian nation. The hoſtile armies approached with a celerity proportioned to the fury of their reſentment, and arrived, with high expectations, at the intermediate plain which overſpread the confines of the two kingdoms. But there, the martial ardour of the troops received a check, which had not been foreſeen by their commanders. The rivulet, interſecting the plain, was ſwelled by the rains into a torrent. This circumſtance prevented a general engagement. The cavalry alone (amounting on either ſide to about five hundred horſe) paſſed near the head of the ravine, and contended in an indeciſive ſkirmiſh; while the fury of the infantry evaporated in unavailing inſults. Night came on, during which the Meſſenians fortified their camp with ſo much ſkill, that the enemy, rather than venture to ſtorm it, preferred to return home, after an expedition, which, conſidering their ſuperiority in numbers, appeared no leſs inglorious than ineffectual.

The puſillanimous behaviour of the Spartan army deſerved not the approbation of the ſenate. The fathers of the republic upbraided the degeneracy of the youth, who no longer paid regard to the ſanctity of the oath which they had taken, never to lay down their arms until they had ſubdued the Meſſenians. The ſpirit of the ſenate was ſoon diffuſed through the community; and it was determined to renew the war with an army which amounted to about twenty thouſand men. The management of the expedition was entruſted to Theopompus and Polydorus; the former of whom commanded the right, and the latter the left, wing, while the central diviſion was committed to the diſcretion of Euryleon, of the royal race of the Theban Cadmus. The Meſſenians were inferior both in numbers and in diſcipline, but ardent in the cauſe of every thing moſt dear to them. Euphaes headed their left wing, which oppoſed the diviſion of Theopompus; Pytharatus led the right; and Cleonnis commanded the centre. When the ſignal was given for the charge, the Meſſenians rather ran than marched to the battle. As they advanced upon the enemy, they reproached them with an inſatiable avidity for wealth and power, an unnatural diſregard to the ties of blood, and an impious contempt for the revered name of Hercules, the acknowledged founder and patron of both kingdoms. From words of reproach they proceeded to deeds of violence. Many quitted their ranks, and aſſailed the embattled phalanx of the Spartans. The wounded ſpent the laſt exertions of their ſtrength in ſignal acts of vengeance, or employed their laſt breath in conjuring their companions to imitate the example of their bravery. To the generous ardour of the Meſſenians, Sparta oppoſed the intrepidity of diſciplined valour. Her citizens, enured to the uſe of arms, cloſed their ranks, and remained firm in their reſpective poſts. Where the enemy in any part gave way, they followed them with fatal progreſs; and endeavoured, by the continuance of regular exertion, to overcome the deſultory efforts of rage, fury, and deſpair.

The kings, who had hitherto been ſatisfied with leading their troops to action, and ſharing the common danger, longed, as the battle began to warm, to ſignalize their valour in ſingle combat. With this deſign, Theopompus firſt marched towards Euphaes, who, ſeeing him approach, cried out to his companions, "Does not Theopompus well imitate the bloody-minded Polynices, who, at the head of an army of ſtrangers, levied war againſt his native country, and, with his own hand, ſlew a brother, by whom, at the ſame inſtant, he himſelf was ſlain? In like manner does Theopompus, with unnatural hatred, perſecute his kinſmen of the race of Hercules; but I truſt he ſhall meet the puniſhment due to his impiety." At ſight of this intereſting ſpectacle, the troops were inſpired with new ardour, and the battle raged with redoubled fury. The choſen bands, who reſpectively watched the ſafety of the contending princes, became inſenſible to perſonal danger, and only ſolicitous to preſerve the ſacred perſons of their kings. The ſtrength of Sparta, at length, began to yield to the activity of her rivals. The troops of Theopompus were broken and thrown into diſorder; and the reluctant prince was himſelf compelled to retire. At the ſame time the right wing of the Meſſenians, having loſt their leader Pytharatus, yielded to the exertions of Polydorus and his Spartans: but neither this general, nor king Euphaes, thought proper to purſue the flying enemy. It ſeemed more expedient to ſtrengthen, with their victorious troops, the central diviſions of their reſpective armies, which ſtill continued to fight with obſtinate valour, and doubtful ſucceſs. Night at length put an end to the engagement, which had proved extremely humiliating to both parties; for next morning neither offered to renew the battle, neither ventured to erect a trophy of victory; while both craved a ſuſpenſion of arms, for the purpoſe of interring the dead. Although the immediate effects of the battle were alike injurious to the Spartans and to the Meſſenians, its remote conſequences were peculiarly ruinous to the latter. They were obliged to ſeek refuge among the almoſt inacceſſible mountains of Ithomè; a place which, though ſituated near the frontiers of Laconia, afforded them the ſecureſt retreat amidſt their preſent calamities, being ſtrongly fortified by nature, and ſurrounded by a wall, which bade defiance to the battering engines known in that early age.

The Meſſenians, thus defended againſt external aſſaults, found means to form a confederacy with the Argives and Arcadians, who from proximity of ſituation, as well as interference of intereſt and ambition, held the Lacedæmonians in peculiar deteſtation. By the aſſiſtance of theſe powerful allies, the Meſſenians gained conſiderable advantages in two general engagements; in the former of which their king Euphaes, betrayed by the ardour of ſucceſs into an unequal combat, was overpowered by numbers, and ſlain in the action. Ariſtodemus was called by the voice of the people to fill the vacant throne; and his conduct in war juſtified the high opinion entertained of him by his countrymen. For five years he baffled the aſpiring hopes of the Spartans; defeated them in ſeveral deſultory rencounters; and, in a pitched battle, fought near the walls of Ithomè, overcame the principal ſtrength of their republic, aſſiſted by that of the Corinthians. This victory threw the Spartan ſenate into great perplexity; but their troops, with revived hopes, again took the field; and their ardour was ſucceſsful in ſeveral ſkirmiſhes with the Meſſenians. Ithomè was immediately inveſted, and, after a ſiege of five months, compelled to ſubmit to the ſlow but irreſiſtible impreſſions of famine. The greater part of the people diſperſed themſelves through the interior towns

towns and villages, endeavouring, in the obſcurity of their ancient habitations, to elude the purſuit of an unrelenting enemy.

The Lacedæmonians, having obtained poſſeſſion of the Meſſenian capital, diſcovered ſignal gratitude to their gods, fidelity to their allies, and cruelty to their enemies. Ithomè was demoliſhed to the foundation. Of its ſpoil, three tripods were conſecrated to Amyclean Apollo. The firſt was adorned with the image of Venus, the ſecond with that of Diana, and the third with the figures of Ceres and Proſerpine. To the Aſſinians, who had aſſiſted them in the war, the Spartans gave that beautiful portion of the Meſſenian coaſt, which aſſumed, and long retained, the name of its new inhabitants. They rewarded Androcles, who, at the commencement of the war, had diſcovered his partiality for Sparta, by beſtowing on his deſcendants the fertile diſtrict Hyamia. The reſt of the Meſſenian nation were obliged to take an oath of allegiance to their conquerors, to preſent them every year with half the produce of their ſoil, and, under pain of the ſevereſt puniſhment, to appear in mourning habits at the funerals of the Spartan kings and magiſtrates.

Thus ended the firſt Meſſenian war. Peace promoted population; and the inhabitants of Peloponneſus continued to diffuſe their numerous colonies over the iſlands of Sicily and Corcyra, as well as over the ſouthern diviſion of Italy, afterwards known by the name of Magna Græcia. In this delicious country two conſiderable eſtabliſhments were formed, about the ſame time, the one at Rhegium, and the other at Tarentum. The cauſes which occaſioned theſe migrations, are not related in ancient hiſtory; the Lacedæmonian eſtabliſhment at Tarentum was alone marked by ſuch circumſtances as have merited, on account of their ſingularity, to be handed down to ſucceeding ages.

During the firſt war of the Spartans againſt Meſſenia, the army, conſiſting of the greater part of the citizens who had attained the military age, bound themſelves, by oath, not to return home until they had ſubdued their enemies. This engagement detained them ſeveral years in the field, during which Sparta, inhabited only by women, children, and decrepid old men, produced no ſucceeding generation to ſupport the future glories of the republic. Senſible of this inconvenience, which, in a warlike ſtate, might have been productive of the moſt dangerous conſequences, the ſenate recalled ſuch young men as, having left their country before they had attained the military age, were not under any obligation to keep the field; and enjoined them to aſſociate promiſcuouſly with thoſe married women, whoſe huſbands were engaged in the war, that the city might thus be preſerved from decay and deſolation. The children born of theſe irregular connections, were diſtinguiſhed by the name of *Partheniæ*; probably denoting the condition of their mothers. They had no certain father; nor were they entitled, though citizens of Sparta, to any private inheritance. Theſe circumſtances kept them a diſtinct body, the members of which were attached by the ſtricteſt friendſhip to each other, and hoſtile to the reſt of the community. This dangerous diſpoſition was farther encreaſed by the imprudent behaviour of the Spartans, who, on their return from the conqueſt of Meſſenia, treated the Partheniæ with the utmoſt contempt. The young men knew how to endure poverty and misfortune, but could not brook diſgrace. Their unhappy ſituation, and the impatience with which they ſubmitted to it, naturally connected them with the Helots, thoſe miſerable ſlaves, whoſe juſt indignation ever prompted them to revolt from the cruel tyranny of their maſters. A conſpiracy was formed; the day, place, and ſignal, were determined, upon which the Partheniæ and Helots, armed with concealed daggers, and with the moſt hoſtile fury, ſhould retaliate, in the public aſſembly, their ſufferings and inſults on the proud lords of Sparta. The time approached, and the deſign was ripe for execution, when the preſident of the aſſembly ordered the cryer to proclaim, That none preſent ſhould throw up his cap (for that had been the ſignal appointed by the conſpirators); and thus clearly intimated that the plot had been diſcovered, and that the Spartans were prepared to overcome the treachery. We are not informed of the puniſhment inflicted on the Helots; but the Partheniæ were treated with remarkable lenity: they were not only allowed to eſcape unpuniſhed, but were furniſhed with every thing neceſſary for undertaking a ſucceſsful expedition againſt the neighbouring coaſts; and thus enabled to eſtabliſh themſelves under their leader Phalantus, in the delightful receſſes of the Tarentine gulph.

The Spartans, delivered from this formidable conſpiracy, enjoyed, above thirty years, domeſtic as well as public peace, until again diſturbed by the revolt of the Meſſenians. The young men of Andania thirſted to take up arms. They were headed by Ariſtomenes, a youth deſcended from the ancient line of Meſſenian kings. Before diſcovering their intention to take arms, the Meſſenians diſpatched meſſengers to the Arcadians and Argives, entreating their aſſiſtance. Both theſe nations joined the Meſſenians; and the firſt battle was fought at Darae, a village of Meſſenia. The ſoldiers, on both ſides, behaved with equal bravery; the victory was doubtful; but Ariſtomenes, the Meſſenian, acquired unrivalled glory and renown. On the field of battle he was ſaluted king by the admiring gratitude of his countrymen. He declined, however, the dangerous honours of royalty, declaring himſelf ſatisfied with the more humble appellation of general. Senſible how much depended on the auſpicious beginning of the war, he immediately marched to Sparta; entered the city by night, and ſuſpended in the temple of Minerva a buckler, inſcribed with his name, as a monument of his ſucceſs againſt the enemy, and an offering to procure the goodwill of that warlike goddeſs.

The boldneſs of this exploit was rivalled by the ſingular intrepidity of his companions Panormus and Gonippus. While the Lacedæmonians celebrated, in their camp, the feſtival of their heroes Caſtor and Pollux, the two youths of Andania, mounted on fiery ſteeds, with lances in their hands, and a purple mantle flowing over their white veſtments, preſented themſelves in the midſt of the joyous aſſembly. The ſuperſtitious crowd, diſſolved in mirth and wine, imagined that their heavenly protectors had appeared in a human form, in order to grace the feſtival eſtabliſhed in their honour. As they approached, unarmed, to pay their obeiſance to the divine brothers of Helen, the young Meſſenians couched their ſpears, attacked the multitude with irreſiſtible fury, ſlew them with their weapons, or trod them down with their horſes, and, before the aſſembly could recover from its ſurpriſe and conſternation, ſet out, in triumph, on their return to Andania.

Theſe exploits were ſufficient to alarm the fears of the Spartans, and to make them ſeek the advice of Apollo. The oracle, when conſulted by what means they might change the ſucceſs of the war, ordered them to demand a general from Athens. The Athenians, on being informed of the oracle, immediately diſpatched to Sparta, Tyrtæus, a man who had never been diſtinguiſhed by any rank in the army. He was chiefly known to his fellow-citizens as a poet; a character in which he has been juſtly admired by ſucceeding ages. Among the Spartans, however, he was regarded as the ſacred meſſenger of the divinity; and his verſes were ſuppoſed to convey the inſtructions and ſentiments inſpired by the oracle. The heroic valour of Ariſtomenes, however, ſtill continued to prevail. He defeated the Spartans in three ſucceſſive engagements, the circumſtances of which are ſo ſimilar, that they have frequently been confounded with each other. They were all fought in

the plain of Stenyclara, and the moſt remarkable at a place called the Boar's Monument, from a tradition that Hercules had anciently ſacrificed there an animal of that ſpecies. The Meſſenians were reinforced by the aſſiſtance of their allies of Elis and Sicyon, as well as of Argos and Arcadia. The Spartans were followed by the Corinthians, their ancient confederates, and by the citizens of Leprea. The combined army was commanded by Anaxander the Spartan king, whoſe influence, however, was rivalled by the authority of Hecatæus the diviner, and of Tyrtæus the poet.

Theſe ſucceſſes were chiefly owing to the ſpirited exertion of the Meſſenian general; and they were celebrated with great pomp at Andania. The men received their favourite hero with joyous acclamations; and their women, ſtrowing his way with flowers, ſung in his praiſe a ſtanza that has reached modern times, expreſſing, with elegant ſimplicity, the glorious victory obtained over the Lacedæmonians. This tribute of applauſe paid to the virtues of Ariſtomenes, inſpired him with a generous ambition further to deſerve the gratitude of his countrymen. With unremitting activity he continued to overrun the hoſtile territory, to deſtroy the defenceleſs villages, and to carry the inhabitants into ſervitude. But after attacking Egila, he met with an unexpected check from the enthuſiaſm of the Spartan matrons, who were offering ſacrifice to Ceres in a neighbouring temple. As ſoon as they perceived the approach of the enemy, the women, who, according to the inſtitutions of Lycurgus, had been trained to all the manly exerciſes of the other ſex, iſſued from the temple, and aſſailing the Meſſenians with knives, hatchets, burning torches, and the other inſtruments of ſacrifice, threw them into a panic, and ſeized the perſon of their commander. Next day, however, Ariſtomenes was delivered from captivity, through the kindly offices of Archidamea, prieſteſs of Ceres, whoſe ſuſceptible heart had long admired the merit and renown of the Meſſenian hero.

The victories of the Meſſenians, which, in the courſe of three years, had been interrupted only by this ſingular incident, diſpoſed the Spartans to abandon the war, and to allow their enemies to enjoy the honour and advantages which they had ſo bravely earned. This reſolution was approved by the ſenate and aſſembly. The allies of Sparta adopted the ſame opinion. Tyrtæus alone oppoſed the diſgraceful meaſure, with all the force of his authority. The ſacred character of the bard, with the divine influence of his poetry, prevailed; and the Spartans again entered Meſſenia with an army, as numerous and powerful as any they had before collected. But at ſight of the Meſſenian troops, headed by Ariſtomenes, they were thrown into new conſternation. A ſecond time Tyrtæus revived their drooping courage, while he expatiated on the glory of ancient warriors; the magnanimity of deſpiſing fortune; and the honours and rewards of victory. Theſe ſentiments, dictated by the true ſpirit of heroiſm, fired their minds with martial ardour. One conſideration only damped the generous warmth that animated their ſouls. In an engagement, which there was every reaſon to believe would be fought with the moſt obſtinate valour on both ſides, what crowds of warriors muſt fall, whoſe bodies, heaped together in confuſion, could not be recognized by their friends, or obtain, with due ſolemnity, the ſacred rites of burial! This melancholy thought, which chilled the boldeſt heart, might have formed an inſurmountable obſtacle to their ſucceſs, had not their terrors been removed by the miſſionary of Apollo. By the advice of Tyrtæus, each ſoldier tied a token, inſcribed with his name and deſignation, round his right arm, by means of which his body, however diſfigured, might be known to his friends and kindred. Thus fortified againſt the only illuſion that could alarm the minds of men who preferred death to a defeat, they ruſhed forward to the attack, reſolving to conquer or die.

The Meſſenian general had drawn up his forces at a place called the Great Ditch, from which this engagement has been called the battle of the Trenches. The national ſtrength was reinforced by a conſiderable body of Arcadian troops, commanded by their king Ariſtocrates, to whoſe treachery, as much as to their own valour, the Spartans were indebted for the victory. When the charge was ſounded, and the Meſſenians were preparing to reſiſt the firſt onſet of the enemy, Ariſtocrates led off his Arcadians; and, to make his defection more apparent, he croſſed the whole Meſſenian army. The Meſſenians, confounded with a treachery ſo bold and manifeſt, almoſt forgot that they were contending againſt the Spartans. Many forſook their ranks, and ran after the Arcadians, ſometimes conjuring them to return to their duty, and ſometimes reproaching them with their perfidious ingratitude. Their entreaties and inſults were alike vain; their army was ſurrounded on almoſt every ſide; the little band of Ariſtomenes alone were able to reſiſt the efforts, and break through the embattled ſquadrons of the enemy.

Among the republics of ancient Greece, the fate of a nation often depended on the event of a battle. The contention was not between mercenary troops, who regarded war as a trade, which they carried on merely from intereſt, without emulation or reſentment. The citizens of free communities fought for their liberties and fortunes, their wives and children, and for every object held dear or valuable among men. In ſuch a ſtruggle they exerted the utmoſt efforts of their ſtrength; nor did the conflict ceaſe, till the one party had reduced the other to extremity. It was not extraordinary, therefore, that after the battle of the Trenches, the Meſſenians ſhould be unable to keep the field. Ariſtomenes, however, determined, while he preſerved his life, to maintain his independence. With this view he collected the miſerable remains of his troops; aſſembled the ſcattered inhabitants of the open country; abandoned the cities and villages on the plain to the mercy of the victors; and ſeized, with his little army, the ſtrong fortreſs of Eira, ſituate among the mountains which riſe along the ſouthern ſhore of Meſſenia, defended on the north by the river Neda, and open only on the ſouth towards the harbours of Pylus and Methonè, which offered it a plentiful ſupply of corn, and other neceſſary proviſions. In this ſituation the gallant Meſſenian reſiſted, for eleven years, from A. C. 682 to 671, the efforts of the Spartans, who endeavoured, with unremitting perſeverance, to gain poſſeſſion of the fortreſs. Nor was he ſatisfied with defending the place: on various occaſions he made vigorous and ſucceſsful ſallies againſt the beſiegers. With a body of only three hundred Meſſenians, he, at different times, over-ran the Spartan territories, and plundered ſuch cities as were either weakly garriſoned or negligently defended. Marching all night, they arrived by day-break at Amyclæ, a Lacedæmonian city, ſituate on the banks of the Eurotas, at the diſtance only of a few miles from the capital. Having entered the place without reſiſtance, they carried off a conſiderable booty in ſlaves and merchandiſe, before the Spartans could arrive to the aſſiſtance of their neighbours.

A continued ſeries of ſuch exploits inſpired the Meſſenians with a degree of confidence, which at length proved fatal to their cauſe. Neglecting thoſe precautions to which they owed their paſt advantages, they began to continue ſo long in the field, that the Spartans found an opportunity to intercept their return. The little band of Meſſenians behaved with its uſual gallantry, and long defended itſelf againſt ſuperior numbers. Ariſtomenes, after receiving many wounds, was taken priſoner; and, with fifty of his braveſt companions, carried in chains to the Lacedæmonian capital. The reſentment of that republic againſt thoſe who had inflicted on her ſuch dreadful calamities, was not to be gratified by an ordinary puniſhment. After much deliberation,

beration, the priſoners were thrown, alive, into the Ceada; a profound cavern, commonly employed as a receptacle for the moſt atrocious criminals. All the companions of Ariſtomenes were killed by the fall; he alone was preſerved by an accident, which, though natural in itſelf, has been diſfigured by many fabulous circumſtances. The Spartans, who regarded valour even in an enemy, permitted him, at his earneſt deſire, to be buried with his ſhield; a weapon of defence held in peculiar veneration by the Grecian ſoldiers. As he deſcended into the deep cavity, the edge of his buckler, ſtriking againſt the ſides of the rock, broke the force of the fall, and ſaved his life. Two days he continued in this miſerable dungeon, amidſt the ſtench of dead bodies, his face covered with his cloak, waiting the ſlow approaches of certain death. The third day he heard a noiſe, and looking up, perceived a fox devouring the mangled remains of his companions. He allowed the animal to approach him, and catching hold of it with one hand, while he defended himſelf againſt its bite with the other, he determined to follow wherever it ſhould conduct him. The fox drew towards a chink in the rock, by which he had entered the cavity. Ariſtomenes then gave liberty to his guide, whom he followed with much difficulty, ſcrambling through the paſſage which had been opened for his deliverance. He immediately took the road of Eira, and was received with unſpeakable aſtoniſhment and delight by his admiring ſubjects.

The news of his wonderful eſcape reached Sparta by ſome Meſſenian deſerters, whoſe information was not more credited, than if they had brought intelligence of one riſen from the dead. But, in the ſpace of a few days, the exploits of Ariſtomenes convinced the incredulity of the Spartans. He was informed that the Corinthian army was on its march, obſerving no order or diſcipline in the day, and encamping during night without guards or centinels. Ariſtomenes reſolved to ſurpriſe them. That no appearance of danger might alarm the negligence of the Corinthians, he waited their approach in concealment, attacked their camp in the dead of night, marked his route with blood, and returning loaded with ſpoils to Eira, offered to Meſſenian Jove the *Hecatomphonia*; a ſacrifice of an hundred victims, which *he* alone was entitled to perform, who with his own hand had killed an hundred of his enemies. This was the third time the Meſſenian hero had celebrated the ſame ſavage rite.

Eleven years had the vigorous and perſevering efforts of a ſingle man prolonged the deſtiny of Eira. Ariſtomenes might have ſtill withſtood the impetuous ardour of the Spartans, but for the ſecret treachery of a Lacedæmonian adulterer, who was the ſlave of Emperamus, the Spartan general. The perfidious ſlave had eſcaped to Eira with his maſter's property, and had formed an intrigue with a Meſſenian woman, whom he viſited as often as her huſband was called in his turn to guard the citadel. Amidſt the miſerable joys of their infamous commerce, the lovers were one night diſturbed by the huſband, who loudly claimed admittance, which however he did not obtain till his wife had concealed the adulterer. When the wife, with the moſt inſidious flattery, inquiring by what good fortune ſhe was *bleſſed* with her huſband's unexpected return, the ſimple Meſſenian related, that the inclemency of the weather had driven the ſoldiers from their poſts, and that Ariſtomenes was prevented by a recent wound from walking the rounds as uſual, and it was not to be expected that the Spartans would venture an attack againſt the citadel during the horror of a tempeſt. The Lacedæmonian ſlave overhearing this recital, cautiouſly eſcaped from his concealment, and fought with the utmoſt celerity the Spartan camp. Emperamus readily pardoned the fortunate treachery of a ſervant that had afforded him the hopes of obtaining the higheſt object of his ambition. Notwithſtanding the ſlipperineſs of the ſteep aſcent, the Spartans, by the direction of the ſlave, mounted the unguarded citadel in the midſt of forked lightning and loud peals of thunder, and obtained poſſeſſion of all the principal poſts, before the Meſſenians were ſenſible of their danger. But as ſoon as it was known that the enemy had entered the city, Ariſtomenes, accompanied by the warlike Theocles, together with their reſpective ſons Gorgus and Manticles, endeavoured to animate the deſpair of their fellow-citizens, and to make them defend to the laſt extremity, the little ſpot of ground to which they could yet apply the endearing name of country. Such however were the terrors and confuſion of the night, that it was impoſſible to form the Meſſenians into any order of battle; and, as the morning dawned, they ſaw the impoſſibility of any other aſſiſtance than what may be derived from deſpair. They determined, at every hazard, to attack and penetrate the Spartan battalions. Even the women armed themſelves with tiles and ſtones, and every weapon that preſented itſelf to their fury. They lamented that the violence of the hurricane prevented them from mounting to the roofs of the houſes, which they had purpoſed to throw down on the enemy; and declared that they would rather be buried under the ruins of their country, than dragged in captivity to Sparta. Such generous reſolutions ought to have retarded the fate of Meſſenè; but it was impoſſible to hold out for ever againſt ſuperior numbers. For three days and nights they withſtood the combined force of their irreſiſtible enemies; and when at length they began to give way, the heroic Theocles threw himſelf into the midſt of the Spartans, crying out, "That they were not always to be victorious, nor the Meſſenians always to be their ſlaves. Such was the will of the gods! who commanded him to periſh in the wreck of a country, which, in a future age, was deſtined to riſe from its ruins."

It might have been expected that the patriotiſm of Ariſtomenes would have choſen the ſame fate with Theocles; but he preferred life for the ſake of defending the ſmall remnant of a community, which, he flattered himſelf, might yet be preſerved for the reſtoration of his country. For this purpoſe, the only expedient that could be employed, was the ſounding a retreat, and the collecting into one body ſuch of his ſoldiers as were not already too far engaged with the Spartans. Having accompliſhed this meaſure, he placed the women and children in the centre of the battalion, and committed the command of the rear to Gorgus and Manticles. He himſelf conducted the van, and marching towards the enemy with his ſpear equably poized, ſhewed, by his mien and countenance, that he was reſolved to defend to the laſt extremity the little remnant of the Meſſenian ſtate. The Spartans, as directed by Hecatus their diviner, opened their ranks, and allowed them to paſs unhurt, judiciouſly avoiding to irritate their deſpair. The Meſſenians abandoned their city, and marched towards Arcadia.

As the wars of the Grecian republics were more bloody and deſtructive than thoſe of modern times, ſo were their alliances more generous and ſincere. When the Arcadians were informed of the taking of Eira, they travelled in great numbers towards the frontiers of their kingdom, carrying with them victuals, clothing, and all things neceſſary to the relief of the unfortunate fugitives; whom, having met at mount Lycæa, they invited into their cities, offered to divide with them their lands, and to give them their daughters in marriage. The generous ſympathy of the Arcadians animated Ariſtomenes to an exploit, the boldneſs of which little correſponded with the depreſſion incident to his fortune. He had only five hundred ſoldiers whoſe activity and ſtrength were ſtill equal to their valour; and theſe he commanded, in the preſence of his allies, to march ſtraightway to Sparta. Three hundred Arcadians deſired to ſhare the glory of

the enterprife; and it was hoped, that as the greater part of the Lacedæmonians were employed in plundering Eira, this fmall but valiant body of men might make a deep impreffion on a city deprived of its ufual defence. The arrangements for this purpofe were taken with the Arcadian king Ariftocrates, whofe behaviour at the battle of the Trenches had occafioned the defeat of the Meffenians, and whofe artifice had fince perfuaded them, that his fhameful behaviour on that day was the effect of terror, and not of perfidious treachery. A fecond time, however, this wretch betrayed the caufe of his country and its allies. Having retarded the execution of Ariftomenes's project, he difpatched a confidential flave to Sparta, who difcovered the imminent danger to Anaxander the Lacedæmonian king. The flave was intercepted on his return, carrying a letter from that prince, in which he acknowledged the faithful fervices of Ariftocrates. Upon the difcovery of this letter, the Arcadians, frantic with difappointment and rage, ftoned to death the perfidious traitor who difgraced the name of king.

Thus ended the fecond Meffenian war, in the autumn of the year 671 before Chrift. The fugitive Meffenians experienced various fortunes. The aged and infirm were treated by the Arcadians, among whom they continued to reide, with all the cordial attention of ancient hofpitality. The young and enterprifing took leave of their benefactors, and under the conduct of Ariftomenes repaired to Cylenè, a harbour belonging to the Eleans. Agreeably to the information which they had received, they found in that place their countrymen of Pylus and Methonè, with whom they confulted about the means of acquiring new eftablifhments. It was determined, by the advice of their Elean friends, not to undertake any expedition for this purpofe until the return of fpring, when they fhould again convene in full affembly, finally to conclude this important deliberation. Having met at the time appointed, they agreed unanimoufly to commit their future fortunes to the wifdom of Ariftomenes, who declared his opinion for eftablifhing a diftant colony, but declined the honour of conducting it in perfon, and named for this office the brave Meffenian youths Gorgus and Manticles. The former of thefe, inheriting his father's hatred againft Sparta, advifed his countrymen to take poffeffion of the ifland of Zacynthus, which, from its fituation in the Ionian fea, lay conveniently for haraffing the maritime parts of Laconia. Manticles propofed a different opinion, obferving, that the ifland of Sardinia, though lefs advantageoufly fituate for the purpofes of revenge, was far better adapted to fupply the neceffary comforts of life; and that the Meffenians, if once fettled in that large and beautiful ifland, would foon forget the calamities which Sparta had inflicted on them. But before any refolution was taken, a meffenger arrived from Rhegium, then governed by Anaxilas, a prince defcended from the royal houfe of Meffenia, who invited his wandering countrymen to a fafe retreat in his dominions. When, agreeably to this invitation, they arrived at Rhegium, Anaxilas informed them, that his fubjects were continually haraffed by the piratical depredations of the Zancleans, an Eolian colony, who poffeffed a delightful territory on the oppofite coaft. With the affiftance of the Meffenians it would be eafy to deftroy that neft of pirates; a meafure by which the city of Rhegium would be delivered from very troublefome neighbours, and the Meffenians enabled to eftablifh themfelves in the moft delicious fituation of the whole Sicilian coaft. The propofal was received with alacrity; the armament failed for Sicily; the Zancleans were befieged by fea and land. When they perceived that part of their wall was deftroyed, and that they could derive no advantage from continuing in arms, they took refuge in the temples of their gods. Even from thefe refpected afylums the refentment of Anaxilas was ready to tear them; but he was reftrained by the humanity of the Meffenians, who had learned from their own calamities to pity the unfortunate. The Zancleans, thus delivered from the fword and from fervitude, fwore eternal gratitude to their generous protectors. The Meffenians returned this friendly fentiment with an increafe of bounty; they allowed the Zancleans either to leave the place, or to remain in the honourable condition of citizens; the two nations gradually coalefced into one community; and Zanclè, in memory of the conqueft, changed its name to Meffenè, a name ftill recognized, after the revolution of twenty-five centuries.

It has been obferved, that Ariftomenes declined the honour of conducting the colony. His fubfequent fortune is differently related by ancient writers. Paufanias informs us, that he failed to the ifle of Rhodes with Demagetes, king of the city and territory of Ialyfus in that ifland, who being advifed by the oracle of Apollo to marry the daughter of the moft illuftrious character in Greece, had without hefitation preferred the daughter of Ariftomenes. From Rhodes he failed to Ionia, and thence travelled to Sardis, with an intention of being prefented to Ardys, king of the Lydians, probably to propofe fome enterprize to the ambition of that prince, which might finally be productive of benefit to Meffenè. But upon his arrival at Sardis he was feized with a diftemper which put an end to his life. Other generals have defended their country with better fuccefs, but none with greater glory; other characters are more fully delineated in ancient hiftory, but none more deferving of immortal fame: fince whatever is known of Ariftomenes tends to prove, that according to the ideas of his age and country, he united, in fingular perfection, the merits of the citizen and of the foldier, the powers of the underftanding, and the virtues of the heart.

The conqueft of Meffenia rendered Sparta the moft confiderable power in Greece. The Peloponnefus, formerly comprehending feven, now contained only fix independent ftates. The fubjects of Sparta alone occupied two-fifths of the whole peninfula. The remainder was unequally divided among the Corinthians, Achæans, Eleans, Arcadians, and Argives. In a narrow extent of territory, thefe fmall communities exhibited a wonderful variety of character and manners. The central diftrict of Arcadia, confifting of one continued cluſter of mountains, was inhabited by a hardy race of herdfmen, proud of their anceftry, and confident in their own courage and the ftrength of their country. Their Eolian extraction, their jealoufy, and their pride, made them difdain connection with the Dorians, by whofe poffeffions they were on all fides furrounded. Careleſs of the arts of peace, they were engaged in unceafing hoftilities with their neighbours, by whom they were defpifed as barbarians, and whom they contemned as upftarts; fince, amidft all the revolutions of Peloponnefus, the Arcadians alone had ever maintained their original eftablifhments.

The induftrious and wealthy Corinthians prefented a very different fpectacle. Inhabiting the mountainous ifthmus, which, towering between two feas, connects the Peloponnefus with the north of Greece, the Corinthians long formed the principal centre of inland communication and foreign commerce. Their fea-fight againft their rebellious colony, Corcyra, is the firft naval engagement recorded in hiftory. It was fought fix hundred and fifty years before Chrift, at which time the Corinthians were regarded by their neighbours as a wealthy and luxurious people. The influence of wealth to produce fervitude prevailed over that of commerce, which is favourable to liberty. Their government, after the abolition of monarchy, was ufurped by a numerous branch of the royal family, ftyled Bacchiadæ. This oligarchy was deftroyed by Cypfelus, a mild and gentle ruler, whofe family governed Corinth till the year 585 before Chrift.

The contraft between Arcadia and Corinth was not more

London, Published as the Act directs. Nov.r 14. 1807. by J. Wilkes

more ſtriking than that between Argolis and Achaia. The citizens of Argos, having expelled their kings, were ſeized with an ambition to domineer over the inferior towns in the province. The inſolence of the capital provoked the indignation of the country. Mycenæ, Træzene, Epidaurus, and other places of leſs note, were often conquered, but never thoroughly ſubdued. Intereſt taught them to unite; and union enabled them to ſet at defiance the power of Argos, by which they were branded as rebellious, and which they reproached as tyrannical. The fortunate diſtrict of Achaia, having ſucceſsfully reſiſted the oppreſſion of Ogygus, an unworthy deſcendant of Agamemnon, eſtabliſhed, at a very early period, a democratical form of policy. Twelve cities, each of which retained its municipal juriſdiction, united on a foot of perfect equality and freedom. This equitable confederacy prepared the way for the Achæan laws, ſo celebrated in later times, when the cauſe of Greece, ſhamefully abandoned by more powerful guardians, was defended by the feeble communities of Achaia.

We have already noticed the important inſtitutions of Iphitus and Lycurgus. The very oppoſite ſyſtems adopted by theſe great legiſlators, reſpectively ſuited the weakneſs of Elis and the ſtrength of Sparta, and occaſioned a remarkable contraſt between the peaceful tranquillity of the former republic, and the warlike ambition of the latter, the lines of whoſe national character grew more bold and deciſive after the Meſſenian conqueſt. The haughty temper of the Spartans became continually more preſumptuous. They totally diſdained ſuch arts and employments as they uſually ſaw practiſed by the induſtry of ſlaves. War, and hunting as the image of war, were the only occupations which it ſuited their dignity to purſue; and this conſtant exerciſe in arms, directed by the military code of Lycurgus, rendered them ſuperior in the field of battle, not only to the neighbouring ſtates of Peloponneſus, but to the braveſt and moſt renowned republics beyond the Corinthian iſthmus.

Having aboliſhed the regal office, the Athenians, whoſe political revolutions were followed with remarkable uniformity by neighbouring ſtates, ſubmitted the chief adminiſtration of their affairs, as above noticed, to a magiſtrate intitled *archon*. The authority of the archon long continued hereditary: it became afterwards decennial: at length nine annual archons were appointed by the powerful claſs of nobility, conſiſting not only of the deſcendants of ſuch foreign princes as had taken refuge in Athens, but of thoſe Athenian families which time and accident had raiſed to opulence and diſtinction. The great body of the people gained nothing by theſe revolutions. The equeſtrian order, ſo called from their fighting on horſeback, which, before the improvement of tactics, rendered them ſuperior in every rencounter with the diſorderly rabble, enjoyed all authority, religious, civil, and military. The Athenian populace, about the year before Chriſt 594, were reduced to a condition of miſerable ſervitude; nor did they recover their hereditary freedom, until the admired inſtitutions of Theſeus were reſtored and improved by Solon, towards the beginning of the ſixth century before Chriſt.

The domeſtic diſſenſions which prevailed in almoſt every ſtate beyond the iſthmus, were only interrupted by foreign hoſtilities. Interference of intereſt occaſioned innumerable conteſts between the Phocians and Thebans, the Dorians and Theſſalians, the Locrians and Ætolians. Their various inroads, battles, and ſieges, which were begun with paſſion, carried on without prudence, and concluded without producing any permanent effect, have been conſigned to a juſt oblivion. But the firſt ſacred war is recommended to our attention, both on account of the cauſe from which it aroſe, and the conſequences with which it was attended. This memorable enterprize was occaſioned by an injury committed againſt the oracle of Delphi; it was undertaken by order of the Amphictyons; it ended in the total deſtruction of the cities accuſed of ſacrilegious outrage; and its concluſion was celebrated by the Pythian games and feſtival; which, of all Grecian inſtitutions, had the moſt direct as well as moſt powerful tendency to refine rudeneſs and ſoften barbarity.

The territory of the Criſſeans, lying to the ſouth of Delphi, near the Corinthian gulph, comprehended three magnificent cities, Criſſa the capital, Cirrha, and Anticirrha, all advantageouſly ſituated for commerce, and placed in the midſt of a diſtrict which had acquired and deſerved the epithet of *Happy*. Their harbour was frequented by the veſſels, not only of Greece, but of Italy and Sicily; they carried on an extenſive foreign commerce, and the neighbourhood of Delphi, at which it was impoſſible to arrive without paſſing through their dominions, brought them conſiderable acceſſions of wealth, as well as of dignity and reſpect. But theſe advantages, inſtead of ſatisfying, increaſed the natural avidity of the Criſſeans. They levied a ſevere impoſt on the pilgrims, whether Greeks or Barbarians, who viſited the temple of Apollo; a meaſure directly inconſiſtent with a decree of the Amphictyons, which declared that all men ſhould have free acceſs to the oracle. The Delphians remonſtrated againſt the extortions of the Criſſeans; but their remonſtrances, inſtead of producing any happy effect, only exaſperated men grown inſolent through proſperity, and at once determined them to plunder the rich ſhrine of Delphi. The imaginations of men were not prepared for ſuch an event; nor had any meaſures been taken to prevent ſuch an unexpected and abominable profanation. The enemy, meeting with no reſiſtance, became maſters of the temple, and ſeized the invaluable offerings accumulated by the pious generoſity of ages. Thence they paſſed into the ſacred wood, and, rendered furious through pride or guilt, attacked, plundered, and murdered, the promiſcuous crowd, who were employed in the uſual exerciſe of their devotions. The young were violated with a licentious rage which bade defiance to decency and nature. Even a deputation of the Amphictyons were repelled with blows and inſults, while they vainly attempted to ſtop the fatal progreſs of theſe frantic and impious outrages, committed againſt every thing held ſacred among men.

The Amphictyonic council, to whom it belonged to judge and to puniſh every atrocious enormity, met with conſiderable oppoſition in proceeding againſt the aggravated crimes of the Criſſeans; and it was not without encountering many difficulties, that Solon, one of the Athenian repreſentatives, rouſed his aſſociates to the reſolution of avenging the offended majeſty of religion, the violated laws of nature, and their own perſonal injuries. The meaſures purſued on the occaſion, were ſlow and indeciſive. The forces brought into the field were by no means equal to the enterprize for which they were deſigned; they were not able, during nine ſummers and winters, to reduce the towns of Criſſa and Cirrha; but which ſubmitted in the tenth year of the war, rather to the art than to the power of the beſiegers.

The Greeks had been for a long time too deeply engaged in domeſtic diſſenſions, to make effectual efforts for the glory of Apollo. Few adventurers repaired to the holy ſtandard; and the war, neither ſupported by vigour of execution, nor directed by wiſdom of deliberation, languiſhed under different generals. At length Eurylochus, a Theſſalian prince, was entruſted with the command of the Amphictyonic army. On ſeveral occaſions he defeated the Criſſeans, who made frequent and vigorous ſallies in order to defend their poſſeſſions. But when he attempted to make an impreſſion on the fortified ſtrength of Criſſa, its thick walls, its lofty towers, and, above all, the activity and courage of its citizens, preſented obſtacles which it was impoſſible to ſurmount. The beſieging army, in the ninth year of the war, was ſorely

ſorely afflicted with a peſtilential diſorder, occaſioned by ſome unknown malignity of the atmoſphere. A great part of the army fell a prey to the increaſing contagion. Anxious for the public ſafety, the Amphictyons had recourſe to the oracle, which directed them to bring from the iſle of Cos the *fawn with gold*. Ambaſſadors were diſpatched to that iſland, in order to unravel the meaning wrapped up in this veil of myſtic obſcurity. They had no ſooner explained their commiſſion in the Coan aſſembly, than an eminent citizen, named Nebros, riſing up, declared the ſenſe of the oracle. "I am the fawn," ſaid he, "pointed out by Apollo," (for Nebros in Greek ſignifies a fawn,) "and my ſon Chryſos" (which is the Greek word for gold) has carried off the prize of ſtrength, courage, and beauty, from all his competitors." The perſon who thus ſpoke, was celebrated on account of his anceſtor Eſculapius, of his deſcendant Hippocrates, and of his own unrivalled ſkill in the healing art. The knowledge of phyſic was become the hereditary honour of his family, by which it had been cultivated for many ages, and to which it is ſuppoſed even at preſent to owe its principal improvement and perfection. Nebros obeyed with alacrity the injunction of Apollo, the peculiar patron of the ſcience in which he excelled. At his own expence he equipped a veſſel of fifty oars, loaded with valuable medicines, as well as with warlike ſtores, and accompanied by his ſon Chryſos, ſet ſail with the Amphictyonic ambaſſadors, in order to cure the confederates deſtined to conquer the Criſſeans.

His advice, his prudence, and his aſſiduity, reſtored the decaying health of the army. Their numbers, however, were ſo much diminiſhed, that it ſeemed impoſſible by open force to put a ſucceſsful end to the war. On this occaſion the artful Coan employed a ſtratagem, which would have appeared inconſiſtent with the laws of arms, if it had not been the dictate of a divine admonition. The horſe of Eurylochus was obſerved for ſeveral days to roll on the ſand, and to ſtrike his foot with great violence againſt a particular ſpot of ground. In digging under this ground, a wooden pipe was diſcovered, which ſupplied Criſſa with water. The extraordinary means by which this diſcovery was made, convinced the ignorant credulity of the Greeks, that ſome important advantage might be derived from it; and upon mature deliberation it was concluded, that Apollo had thus ſuggeſted a contrivance for deſtroying his own and their enemies. Agreeably to the intimation, Nebros poiſoned the conduit of water; and the effect of this deteſtable artifice was ſoon diſcernible in the languid efforts and diminiſhed reſiſtance of the beſieged. The beſiegers, thus encouraged, carried on their operations with redoubled vigour. A reward was propoſed for the man who ſhould firſt mount the walls, an honour obtained by the youthful ardour of Chryſos. The city was taken by aſſault; the fortifications were demoliſhed, the houſes burnt, and the inhabitants treated with a ſeverity proportioned to the ſacrilegious enormity of their own crimes, and the exaſperated reſentment of the victors.

The command of Apollo, however, was not completely executed by the deſtruction of the Criſſean capital: the maritime town of Cirrha was next to be reduced; and the mode of ſucceeding in it was only to be aſcertained by again having recourſe to the oracle. The anſwer delivered was involved in twofold obſcurity: "You ſhall not overturn the lofty towers of Cirrha, until the foaming billows of blue-eyed Amphitrité beat againſt the reſounding ſhores of the Holy Land." How could the ſea be conveyed for ſeveral leagues over rocks and mountains, to daſh againſt the craggy precipices which ſurround the ſacred groves of Delphi? This was an enigma which the Amphictyonic council acknowledged themſelves unable to explain. Solon, the Athenian, alone ventured to propound the meaning. His ſuperior wiſdom taught him the impiety of ſuppoſing that the god ſhould require an impoſſibility as the condition of happily terminating a war, the firſt meaſures of which he had himſelf ſuggeſted and approved. It exceeded, indeed, human power to extend the ſea to the boundary of Delphi; but by removing this boundary, it was poſſible to make that Holy Land communicate with the ſea. This might eaſily be accompliſhed, ſince it only ſufficed for that purpoſe, to conſecrate all the intermediate ſpace with the ſame ceremonies which had formerly been employed in dedicating the Delphian territory. The opinion of Solon was honoured with the unanimous approbation of his aſſociates. Preparations were made for carrying it into execution, and the property of the Cirrhean plain was ſurrendered to the god with the moſt ſacred rites and pompous formality.

When the ſenators had performed the conſecration, the ſoldiers aſſailed the walls of Cirrha with the increaſing activity of re-animated hope. That place, as well as the dependent town of Anticirrha, ſituate on the oppoſite ſhore, ſoon ſubmitted to their arms. The devoted citizens were either put to the ſword, or dragged into captivity. The Criſſean community, formerly ſo rich and flouriſhing, was for ever extinguiſhed. Their lands were laid waſte, their cities demoliſhed, the proud monuments of their victories levelled with the ground; and the port of Cirrha, which was allowed to remain as a convenient harbour for Delphi, ſubſiſted as the only veſtige of their ancient grandeur.

The ſucceſsful event of a war, begun, carried on, and concluded, under the ſanction of the Amphictyonic council, was celebrated with all the pomp and feſtivity congenial to the Grecian character. According to an ancient inſtitution, the ſeveral republics were accuſtomed, by public ſhows, to commemorate their reſpective victories. When different communities had employed their joint efforts in the ſame glorious enterpriſe, the grateful triumph was exhibited with a proportional increaſe of magnificence; but the fortunate exploits of gods and heroes, which had extenſively dignified the Grecian name, were diſtinguiſhed by ſuch peculiar and tranſcendent honours as eclipſed the ſplendour of all other ſolemnities. While each republic paid the tribute of provincial feſtivals to the memory of its particular benefactors, the whole nation were concerned in acknowledging the bountiful goodneſs of Jupiter, the protecting aid of Neptune, the unerring wiſdom of Apollo, and the unrivalled labours of Hercules. Hence the Olympian, Iſthmian, Pythian, and Nemean, games, which, though alike founded on the ſame principle of pious gratitude, were, from their firſt eſtabliſhment, diſtinguiſhed by different ceremonies, and reſpectively conſecrated to ſeparate divinities.

FROM THE TERMINATION OF THE FIRST SACRED WAR, TO THE FINAL OVERTHROW OF THE PERSIAN INVASION.

The handful of Greeks who had eſtabliſhed themſelves in Aſia and Africa, wonderfully maintained and extended their poſſeſſions in thoſe quarters of the world. Wherever the ſpirit of enterpriſe diffuſed their ſettlements, they perceived, on the ſlighteſt compariſon, the ſuperiority of their own religion, language, inſtitutions, and manners; and the dignity of their character and ſentiments eminently diſtinguiſhed them from the general maſs of nations whoſe territories they conquered. Yet theſe advantages, inſtead of conciliating good-will, tended only to exaſperate hoſtility. The northern Greeks were perpetually haraſſed by the fierce inroads of the Thracians: the ſouthern were endangered by the united ſtrength of Egypt and Lybia. The colonies in Magna Græcia, having eaſily reſiſted the rude though warlike natives of that country, were called to contend with the more formidable power of Carthage. But the conſequences of all theſe wars extended not beyond the countries

countries in which they firſt aroſe. The memorable conflict between the Greek colonies in the Eaſt, and the great nations of Aſia, forms a ſubject more extenſively intereſting.

Through the ſupine neglect of their neighbours reſpecting maritime affairs, the Aſiatic Greeks acquired without conteſt, and enjoyed without moleſtation, beſides ſeveral valuable iſlands, the whole weſtern coaſt of the continent, extending, in a waving line, above ſix hundred miles in length, beautifully diverſified by hill and dale, interſected by rivers, and adorned by the nobleſt proſpects and fineſt climate in the world. Its inhabitants, having convenient and capacious harbours before them, and behind, the wealthy and populous nations of Aſia, whoſe commerce they enjoyed and engroſſed, attained ſuch early and rapid proficiency in the arts of navigation and traffic, as raiſed the cities of Miletus, Colophon, and Phocæa, to an extraordinary pitch of opulence and grandeur. Their population increaſing with their proſperity, they diffuſed new colonies every where around them. Having obtained footing in Egypt, in the eighth century before Chriſt, they acquired, and thenceforth preſerved, the excluſive commerce of that ancient and powerful kingdom. Such multiplied advantages could not languiſh in the hands of men who had genius to conceive, and courage to execute, the moſt arduous deſigns. With the utmoſt induſtry and perſeverance they improved and ennobled the uſeful and elegant arts, which they found already practiſed among the Phrygians and Lydians.

The firſt formidable enemies with whom the Aſiatic Greeks had to contend, were the barbarous Cimmerians, who, being driven from the banks of the Euxine, by a Scythian horde ſtill fiercer than themſelves, overflowed, with irreſiſtible violence, the fineſt provinces of Aſia Minor. But the invaſion of the Cimmerians was a predatory incurſion, not a regular plan of enterpriſe. The hurricane ſoon ſpent its force; the Greeks recovered from the terror inſpired by theſe deſultory ravagers, and, within a few years after their departure, the Ionian and Eolian colonies, totally forgetting their common danger, engaged in cruel domeſtic wars. Theſe unnatural diſſenſions were at length repreſſed by the growing power of the Lydians. The kingdom of Lydia was anciently ſubject to a race of princes, ſtyled Atyatidæ, from Atys, the great founder of their houſe. To the family of Atys ſucceeded that of Hercules, which had obtained the government before the war of Troy, and continued to reign five hundred and five years, till their honours expired in the unhappy Candaules. The ſtory of Candaules, of his beautiful wife, and of his fortunate ſervant, has been adorned by the father of hiſtory with the inimitable charms of his Ionic fancy. The vain, credulous prince, injudiciouſly diſplaying the beauty, offended the modeſty, of his injured ſpouſe. Gyges, the moſt favoured of her huſband's attendants, to whom his weak maſter had proſtituted the ſight of her naked charms, was involuntarily employed as the inſtrument of her reſentment. As a reward for taking away the life of Candaules, he was honoured with the hand of the queen, and from the rank of captain of the guard, was advanced to the throne of Lydia.

This revolution, which happened ſeven hundred and eighteen years before Chriſt, was felt by the neighbouring nations, who ſoon diſcovered in the enterpriſing character of Gyges, the difference between adventurers who acquire, and princes who inherit, a crown. The Ionian cities of Aſia offered a tempting prize to the valour of Gyges, and the valuable mines diſcovered between the cities Atarneus and Pergamos, enabled him to hire ſuch a number of troops as ſeemed neceſſary to accompliſh his ambitious deſigns. The citizens of Miletus and Smyrna were haraſſed by a long war; but of all the Ionic ſettlements, Colophon alone ſubmitted to his arms, B. C. 680. Ardys his ſucceſſor, following the military example of Gyges, ſtormed the city of Prienè, and invaded the territories of the Mileſians. He tranſmitted his enmity againſt that people to his ſon Sadyattes, from whom it deſcended to his more warlike grandſon. Alyattes, grandſon of Ardys, annually invaded the country of Miletus, cut down the trees, burnt the ſtanding corn, ravaged and deſolated the whole territory. In this manner he continued, during eleven years, to haraſs, but was unable to conquer, the Mileſians. The inhabitants of the country retired at his approach, and ſhut themſelves up in their capital, the walls of which bade defiance to his aſſaults; nor was it poſſible to reduce by blockade a city that had long been, and ſtill continued, miſtreſs of the ſea. But Alyattes perſiſted in diſtreſſing thoſe whom it ſeemed impoſſible to ſubdue; and he was carrying on his twelfth autumnal incurſion with fire and ſword, when the flames of the ſtanding corn, impelled by the violence of the wind, communicated with the temple of Aſſeſian Minerva. That ſacred edifice was burnt to the ground. Alyattes, who was attended on his march by pipes, harps, and flutes, did not immediately conſider, amidſt the noiſe of military triumph, the fatal conſequences of this enormous impiety. But falling ſick ſoon after at Sardis, he had leiſure to reflect on the horror of his crime; and, prying into futurity, he diſpatched meſſengers to the temple of Delphi, to conſult the Grecian god concerning the means of mitigating the diſtreſs of his preſent ſtate of mind. Apollo refuſed giving an anſwer to his petition, until he had rebuilt the temple of Minerva. The Lydian prepared to comply with this condition, and immediately ſent ambaſſadors to Miletus, to propoſe a ſuſpenſion of arms, until the great work ſhould be completed. That city was then governed by Thraſybulus, who, by one of thoſe revolutions not unfrequent in the Grecian republics, had attained the rank of tyrant, as it was then called, in a ſtate uſually governed as a democratical community. Similarity of views and diſpoſitions had introduced a friendly connection between Thraſybulus and the celebrated Periander of Corinth, who was no ſooner acquainted with the advice of Apollo, than he ſent immediate intimation of it to the Mileſian prince, counſelling him at the ſame time to avail himſelf of the preſent conjuncture to promote the intereſt of his country. When the Lydian ambaſſadors arrived at Miletus, they were treated with ſuch generous hoſpitality, that returning to Sardis, they repreſented in very affecting language the princely conduct of a people, whom it had been the great object to afflict and to annoy. Alyattes, affected by the intelligence, conſented to an immediate peace with the Mileſians; and to compenſate for his paſt injuries and impiety, he promiſed to dedicate to Minerva two new edifices, the magnificence of which ſhould far eclipſe the ſplendour of her ancient temple. The promiſe was performed, the new temples were conſecrated, Alyattes recovered from his diſtemper, and peace was eſtabliſhed between the two nations.

This prince was ſucceeded five hundred and ſixty-two years before Chriſt, by his ſon Crœſus, whoſe uninterrupted proſperity, in the firſt years of his reign, far eclipſed the glory of all his predeceſſors. But the ſplendour of Crœſus was that of a paſſing meteor, which dazzles for a moment, and diſappears for ever. Under various unjuſt pretences he attacked the Grecian cities of Aſia Minor, which being undiſturbed by foreign war, had unfortunately engaged in domeſtic feuds. While jealouſy prevented the Greeks, ignorance hindered the barbarians, from forming a confederacy ſufficient to reſiſt the Lydian power. The Carians, Myſians, and Phrygians, fighting ſingly, were ſucceſſively ſubdued; and the whole peninſula of Leſſer Aſia (except only the little territory of the Lycians and Cilicians,) extending eaſtward as far as the river Halys, and inhabited by three nations of Grecian, and eleven of barbarian extraction,

traction, finally acknowledged the power of Crœsus, and submitted to his commands.

Having met with such extraordinary success by land, the Lydian prince determined to render his power equally conspicuous by sea. For this purpose he thought seriously of equipping a fleet, with which he purposed to conquer the Grecian islands directly fronting his dominions. But this design, which, considering the slow progress in maritime power among the nations most diligent to attain it, would probably have failed of success, was prevented by the advice of a philosophical traveller, conveyed in such a lively turn of wit, as easily changed the resolution of the king. Bias of Prienè, in Ionia, some say Pittacus of Mitylenè, in the isle of Lesbos, while he travelled, after the Grecian custom, from curiosity and a love of knowledge, was presented to Crœsus at the Lydian court; and being asked by that prince what news from Greece? he answered with republican freedom, that the islanders had collected powerful squadrons of cavalry, with an intention of invading Lydia. "May the gods grant," said Crœsus, "that the Greeks, who are unacquainted with horsemanship, should attack the disciplined valour of the Lydian cavalry; there would soon be an end to the contest." "In the same manner," replied Bias, "as if the Lydians, who are totally unexperienced in naval affairs, should invade the Grecians by sea." Struck by the acuteness of this reply, Crœsus desisted from his intended expedition; and, instead of employing new means for extending his conquests, determined peaceably to enjoy the laurels which he had won, and to display the grandeur which he had attained.

His court was the gayest and most splendid of any in that age; and the Asiatic Greeks, whatever dishonour they incurred, sustained not, perhaps, any real loss by their easy submission to a vain and weak man, but a magnificent and liberal prince, who was extremely partial to their country. They acknowledged the conqueror, indeed, by a very moderate tribute, but they enjoyed their ancient laws, and administered without controul their domestic concerns and government. Crœsus spoke their language, encouraged their arts, admired and protected their poets and philosophers. Ionia, perhaps, was never more happy than under the eye of this indulgent master, whose protection nourished the tender shoot of philosophy, which had begun to spring up shortly before his reign. Thales of Miletus, Pittacus of Mitylenè, Bias of Prienè, Cleobulus of Lindus, and the other wise men, as they are emphatically styled, who lived in that age, not only gave advice and assistance to their countrymen in particular emergencies, but restrained their vices by wholesome laws, improved their manners by lessons of morality, and extended their knowledge by many important discoveries.

For several years Crœsus remained not only the master but the friend of the Greeks, when the growing greatness of Persia threatened the safety of his dominions, and roused him again to arms. That country was anciently confined to a small part of the immense region at present known by the Persian name. Its inhabitants had rapidly become formidable, and in the course of a few years, under the elder Cyrus, they extended their name and conquests over Upper Asia, overturned the power of Crœsus, enslaved the Greeks of Asia Minor, and for the first time, threatened Europe with the terrors of Asiatic despotism. See the article PERSIA.

During the reign of Crœsus, and his four immediate predecessors, the Asiatic Greeks sometimes enjoyed their favourite form of republican government, sometimes submitted to domestic tyrants, alternately recovered and lost their national independence; but the success of the ambitious Cyrus was not likely to improve their condition. When his hostile intentions were first made known in Ionia, the inhabitants of that delightful country assembled in the Panionian grove, their ordinary rendezvous in important deliberations. This place, which, together with the adjoining promontory of Mycalè, was solemnly consecrated to Neptune, formed the centre of the Ionic coast. Towards the north extended the spacious bay of Ephesus, beyond which the beautiful peninsula of Clazomenè stretched an hundred miles into the Ægean. On the south, the territory of Miletus occupied sixty-two miles of the winding shore. But the Milesians sent not their deputies to the present convention; for having been the confederates, not the subjects, of Crœsus, they were admitted into the Persian alliance on terms of equality and independence. The Grecian interest in Asia, thus ungenerously abandoned by the principal member of the confederacy, was supported with unusual spirit by all the inferior communities. Representatives immediately appeared from Myus and Prienè, which were situate, like Miletus, on the coast of Caria; from Ephesus, Colophon, Lebedus, Teos, Clazomenè, Erythræ, Phocæa, and Smyrna, which formed the maritime part of Lydia; and from the isles of Chios and Samos, which completed the whole number of the Ionic settlements. But to these were added the alliance of the Eolians, who were alarmed and threatened by the same danger.

The Asiatic Greeks, however, examining the state of their affairs, still felt their own weakness, compared with the strength of the enemy. They therefore resolved to send an embassy into Greece, in order to explain the danger to which they were exposed, and to shew the necessity of powerful and timely aid. It might have been expected that Attica, the native country of the Ionians, should have received the first visit of the ambassadors; but Athens was then governed by the tyrant Pisistratus, who, it was supposed, would be averse to take arms against a tyrant like himself. Sparta, though a republic of greater power and renown, was little connected, either by commerce or affinity, with the Greeks of Asia. The proposals of the Asiatic ambassadors, therefore, were very coolly received by the Spartan senate; and the Lacedæmonians, mindful of the ancient enmity between the Ionic and the Doric race, declined sending any forces into Asia, to resist the arms of Cyrus. But though their generosity furnished no public assistance, their caution privately dispatched several Spartan citizens to observe the operations of the war. When these men arrived in Ionia, they were easily persuaded to exceed the bounds of their commission. They appointed Lacrines, the most considerable of their number, to travel to the Lydian capital, in order to acquaint Cyrus, that if he committed hostilities against any of the Grecian cities, the Lacedæmonian republic would know how to punish his injustice. Cyrus, astonished at such an insolent message from a people altogether unknown to him, asked the Greeks who the Lacedæmonians were? and what number of men they could bring into the field? When informed of these particulars, he replied to the Spartan ambassador, "That he never should fear men who had a square in the midst of their city, in which they met together to practise mutual falsehood and deception; and that if he continued to enjoy the blessings of health, he should afford the Spartans more domestic reasons of complaint, than his military preparations against the Greeks of Asia." After this interview with Lacrines, looking on the Grecian power with contempt, he thought proper to attempt in person enterprises of greater renown, while he committed the Grecian war to the skill of his lieutenant Harpagus.

The war with Cyrus commenced in the year before Christ 539; and in the course of a few months Harpagus made himself master of all the countries of Lower Asia, possessed by either Greeks or barbarians. Having the command of men and labour, he caused mounds of earth to be thrown up adjacent to the Grecian walls. In this service, immense numbers must have perished by

by the darts of the enemy; but the work was no ſooner completed, than the Perſians, running up the mounds, got poſſeſſion of the walls, drove the Greeks from their battlements, overpowered them from their own fortifications, entered, and ſacked their towns.

The firſt place which Harpagus attacked was the celebrated capital of the Phocæans, the moſt northern city of Ionia. The inhabitants, as already mentioned, were famous for their long and ſucceſsful navigations, in the courſe of which they had often viſited the coaſts of Spain, the Mexico and Peru of the ancient world. The money derived from that country had enabled them to build the beſt fortification that was to be ſeen in all thoſe parts; yet they entertained not any hopes of reſiſting the Perſian invaders. Such, however, was their love of liberty, that they reſolved on a meaſure which has been often propoſed, but ſeldom executed. When Harpagus ſent them his commands, they begged the favour of a day's pauſe for deliberation. In all probability they had already taken meaſures for effecting their eſcape; for during that ſhort interval, their ſhips were prepared, their money and goods put on board, their wives and families embarked, and the whole community was floating on the waves, when the Perſians arrived to take poſſeſſion of deſolated walls and empty dwellings. The advantageous ſituation of Phocæa, and the pains which had been taken to improve and to embelliſh it, make this flight very extraordinary; if any thing can add to the wonder, it is that a whole people ſhould unanimouſly abandon their temples, their altars, and, what in ancient times ſeemed not leſs ſacred, the tombs of their anceſtors; ſhould totally diveſt themſelves of every right to a country which they had ſo long called their own; and ſet ſail with their wives and children, ignorant whither to direct their courſe, or in what friendly port they might expect protection or repoſe.

The Phocæan fleet, conſiſting of more than two hundred ſail, made for the iſle of Chios, which, of all the Ionic ſettlements, ſeemed moſt ſecure againſt the Perſian arms. Having arrived there, they endeavoured to purchaſe from the Chians the ſmall Oenuſſian iſlands: but the Chians, jealous of their commerce, and knowing the adventurous ſpirit of the fugitives, denied their requeſt. The Phocæans, thus rejected by men of the ſame race and language with themſelves, ſet ſail on a much longer voyage, for the iſle of Cynus, or Corſica, where, about twenty years before, they had formed a ſmall eſtabliſhment. As they coaſted in the night along the ſolitary ſhore of their ancient city, a few ſhips, manned with enterpriſing crews, landed in the harbour, ſurpriſed the Perſian garriſon, and put every man to the ſword. After applauding this memorable act of revenge, the whole fleet, tranſported with fury againſt the Perſians, bound themſelves by mutual oaths never to return to Phocæa, until a burning ball of iron, which they threw into the ſea, ſhould again emerge unextinguiſhed. Yet ſuch is the powerful attachment of men to their native ſoil, that in a few hours, more than one half the fleet diſregarded their oaths, and ſailed for the well-known harbour. The deſtruction of the Perſian garriſon removed the only obſtacle in the way of immediate poſſeſſion; and the blame of this maſſacre might be thrown on their countrymen who fled, while thoſe who returned to Phocæa might prove their innocence, by ſpeedily ſubmitting to every burden impoſed on them. Meanwhile, the beſt and braveſt portion of the Phocæan republic landed with ſafety on the iſland of Corſica.

The Phocæans were not the only people of Aſiatic Greece who deſerted their country, rather than abandon their liberty. The Teians, who inhabited the ſouthern ſhore of the Ionic peninſula, followed the example which the inhabitants of Phocæa had ſet; forſook a city in which they could no longer remain free, and ſought refuge in Abdera, an ancient colony of Clazomenè, on the coaſt of Thrace, near the mouth of the Neſſus. The city of Clazomenè, now mentioned, was built on the continent; but on the preſent occaſion, the inhabitants, to avoid ſlavery, ſettled in eight ſmall iſlands, at a little diſtance from the ſhore, on which they founded a new city, the model of that of Venice. The advantage which the Clazomenians enjoyed by nature, the Cnidians endeavoured to procure by art. They occupied the extremity of the Carian peninſula; and their city being joined to the continent by an iſthmus of only half a mile broad, they attempted by means of a foſs, to detach themſelves entirely from the main land. If this could be effected, they might deſpiſe the power of their enemies, who not having as yet ſubdued the Phœnicians, poſſeſſed not any naval force ſufficient to conquer the Grecian iſles. But the approach of the Perſians, and ſtill more their own ſuperſtitious fears, interrupted this uſeful undertaking; and the city of Cnidus, as well as all others on the Aſiatic coaſt, Miletus alone excepted, were reduced to the Perſian yoke. Thus, while the arms of Harpagus were every where ſucceſsful on the weſtern ſhore, thoſe of Cyrus acquired ſtill greater glory in the central parts of Aſia. With amazing rapidity his victorious troops over-ran the rich countries between the Mediterranean and the Tigris; reduced the city of Babylon; and his ſon Cambyſes received the ſubmiſſion of Tyre and Cyprus, and effected the entire conqueſt of Egypt, in the conſequences of which the Greek colonies in that country were involved.

Cambyſes is ſaid to have died by an accidental wound from his own ſword. Darius Hyſtaſpes, the third in ſucceſſion to the empire, poſſeſſed the political abilities, but reached not the magnanimity, of Cyrus. His ambition was unbounded, and his avarice led him to project the conqueſt of Greece, in the hope of enriching himſelf by the ſpoils of ſo luxuriant a country. Hiſtiæus, tyrant of Miletus, for ſome time favoured the idea of this grand invaſion. He was taken into the confidence of Darius, and accompanying him to Sardis, and afterwards to Suſa, became the friend, counſellor, and favourite, of the great king. While Hiſtiæus acted ſuch a diſtinguiſhed part at the Perſian court, his nephew Ariſtagoras, to whom he had committed the government of Miletus, incurred the diſpleaſure of Artaphernes, the brother of Darius, and governor of Sardis. The repreſentations of that miniſter, he well knew, would be ſufficient to ruin him, both with his uncle, and with Darius, by whom he might be deprived not only of his authority, but of his life. Governed by theſe conſiderations, Ariſtagoras meditated a revolt, when a meſſenger unexpectedly arrived from Hiſtiæus, exhorting him to that meaſure. The crafty Mileſian, who ſoon diſliked the reſtraint of the Perſian king, languiſhed for a pretence to return to his native country. His meſſage confirmed the reſolution of Ariſtagoras, who, as the firſt act of rebellion againſt the Perſians, formally renounced all power over his fellow-citizens. After giving this diſintereſted proof of his regard for the public, he erected the ſtandard of freedom, which was ſoon ſurrounded by the flower of the Ionian youth; by whoſe aſſiſtance, traverſing the whole coaſt, he aboliſhed in every city the authority of kings, and proclaimed to all worthy to acquire it, the bleſſing of civil liberty and national independence. The revolt thus haſtily commenced, could not be maintained without more powerful reſources than the ſtrength of the Aſiatic Greeks. In order to reſiſt the force of the Perſian empire, it was neceſſary for the Ionians to obtain the cooperation of their brethren in Europe. This important object was committed to the prudence and activity of Ariſtagoras, who having ſettled the affairs of the Eaſt, undertook the embaſſy into Greece.

Lacedæmon ſtill continued the moſt powerful ſtate in that country; and was then governed by Cleomenes. To him Ariſtagoras found it neceſſary to apply; and in order

order to effect the object of his miſſion, he deſcribed to the Spartan king the immenſe wealth of the Perſians, which they had neither virtue to enjoy, nor valour to defend. He painted in the warmeſt colours, the love of liberty which animated the Ionians, and their firm expectation that the Spartans would enable them to maintain that political independence, which their own laws taught them to conſider as the moſt valuable of all human poſſeſſions. Their intereſt, he obſerved, was on this occaſion united: and how much greater glory might be acquired by conquering Aſia, than by ſuffering an invaſion to be made for ravaging Greece? the Perſian archers it would be eaſy to ſubdue; and the journey to Suſa, the rich capital of the Perſian dominions, would be not only ſafe but delightful. Cleomenes, having patiently liſtened to the ſupplication of the Mileſian, anſwered him with Laconic brevity, "In three days I will decide concerning the propriety of your demand." At the expiration of that time, Ariſtagoras failed not to repair to the place appointed, where he was ſoon met by the Spartan king, who aſked him, In how many days they might march to Suſa? He replied unguardedly, That travelling at the rate of about eighteen miles a day, they might reach Suſa in three months. Upon this, Cleomenes exclaimed with indignation, "Mileſian ſtranger, you muſt be gone from Sparta before the ſetting of the ſun; for you have made a very inauſpicious and a very dangerous propoſal, in adviſing the Spartans to undertake a journey of three months from the Grecian ſea."

Ariſtagoras, thus diſmiſſed from Sparta, had recourſe to the Athenians, from whom he had reaſon to expect a more favourable reception. Athens was the mother-country of the Ionians, who formed the greateſt and moſt diſtinguiſhed portion of the Aſiatic Greeks. Ariſtagoras had no ſooner arrived at Athens, than he openly ſolicited the aſſiſtance of the Athenians in defending their own colonies againſt the oppreſſive violence of the common foe. Many arguments were not neceſſary to make the ſenate adopt a meaſure which gratified their own paſſions. The aſſembly immediately decreed that aſſiſtance ſhould be ſent to Ionia. Twenty ſhips were fitted out with all convenient ſpeed, which, reinforced by five more belonging to Eretria, a town of Eubœa, they all unbent their ſails in the harbour of Miletus. Ariſtagoras ſpent no long time in his embaſſy to the other ſtates of Greece, but ſoon met his Athenian allies at that place. It was here determined, that while the commander in chief regulated the civil affairs of the Ionians, his brother Charopinus ſhould conduct a military expedition againſt the wealthy capital of Lydia. The united fleets left the harbour of Miletus, and ſailed to Epheſus, where the troops were diſembarked; and, in three days, accompliſhing a journey of ſeventy miles, appeared before the walls of Sardis. The Perſian governor little expected ſuch a viſit; his ſoldiers were not prepared to take the field; and the extenſive walls of the city could not be defended, on all ſides, againſt the beſiegers. Artaphernes, therefore, contented himſelf with defending the citadel; while the Greeks, without oppoſition, entered the city, in order to plunder the accumulated wealth of that ancient capital. But an accident prevented them from reaping the fruits of their ſucceſs. The reſentment of a rapacious ſoldier, diſappointed of his prey, ſet fire to the houſe of a Lydian on the ſkirts of the city, which communicating to the reſt of the houſes, in a ſhort time the whole circumference of the place was ſurrounded with a wall of fire. Sardis was built in the Grecian manner, having a ſpacious ſquare in the centre, which commonly ſerved for the market-place. Thither the Perſians, driven from the extremities, betook themſelves for refuge againſt the fury of the flames. Arms formed part of the dreſs of the barbarians, and the Perſians, who had aſſembled in the ſquare without any intention of making defence, diſcovered their own ſtrength to be more than ſufficient to reſiſt the enemy. Meanwhile the fire of Sardis brought the inhabitants from all parts of Lydia to their aſſiſtance. The Greeks were attacked, repelled, obliged to abandon their booty; and it was not without much difficulty that they effected their eſcape. The enemy, collecting their whole force, purſued them to Epheſus, and defeated them with great ſlaughter. The Eubœan auxiliaries behaved with uncommon ſpirit, headed by their countrymen Eualcides, whoſe Olympic victories had been highly extolled in the verſes of Simonides, and whoſe death on this occaſion was long and deeply regretted.

Bad fortune is commonly attended with diſſenſions in a confederate army. The allies threw the blame on each other, and the Athenians returned home in diſguſt, determined no longer to endanger themſelves for the ſake of men who employed ſo little wiſdom or valour in their own defence. The Ionians, though deſerted by their allies, and defeated by the enemy at land, ſtill carried on the war by ſea. Sailing northwards, they reduced Byzantium, and all the neighbouring cities on the Helleſpont, or Propontis. Their fleet then directed its courſe to Caria, and having become maſter of the moſt conſiderable portion of that coaſt, defeated the Phœnicians off the iſle of Cyprus. The military ſucceſs of the Perſians tempted them, on the other hand, to proſecute the war by land; and their ſubſequent operations diſcovered ſuch a degree of prudence and courage, as they ſeem never to have exerted on any future occaſion. In order the more ſpeedily to quaſh the hopes of the inſurgents, they formed the numerous army into three diviſions, allotting to each its particular department. After theſe ſeparate brigades had reduced the ſmaller cities of the Eolians, Dorians, and Ionians, the three great branches of the Hellenic race, it was concerted, that they ſhould re-aſſemble in one body, to attack Miletus, which was regarded as the metropolis of the whole country. This plan, ſo judiciouſly concerted, was carried into execution by three ſons-in-law of Darius, Hymees, Dauriſes, and Otanes; the firſt of whom reduced the Eolian cities; the ſecond conquered the Dorians, as well as the other inhabitants of Caria; while Otanes, aſſiſted by the counſels of Artaphernes, overran the Ionic coaſt, burning and deſtroying all before him. The miſerable natives were put to the ſword, or dragged into captivity; the more fortunate eſcaped theſe calamities by flying to their ſhips, or taking refuge within the lofty walls of Miletus. But the time now approached for attacking that place, which, as its harbour commanded the coaſt, it was neceſſary to inveſt both by ſea and land. We might here expect to find Ariſtagoras diſplaying the fertile reſources of his genius; but before Miletus was beſieged, Ariſtagoras was no more.

About this time the inſidious and ſubtle Hiſtiæus, uncle of Ariſtagoras, arrived from Suſa, commiſſioned by Darius to direct, by his experienced wiſdom, the valour and activity of the Perſian generals. The birth, the education, the manners of this ſingular man, together with the ſtrong partiality of every Greek in favour of his native land, might have afforded good reaſon to the Perſian king to ſuſpect his fidelity: he indeed ſuſpected it; but the artful addreſs, the warm profeſſions, the ſubtle inſinuation, of Hiſtiæus, eaſily overcame every prejudice which his ſituation and character made it natural to conceive againſt him. He was ſent to aſſiſt the army of Darius in cruſhing the Grecian rebellion; but his real intention was to take upon himſelf the conduct of that rebellion, and to raiſe his own greatneſs on the ruins of the Perſian power. As he paſſed to the coaſt of Aſia Minor, his intrigues produced a conſpiracy at Sardis, which, being diſcovered by the vigilance of Artaphernes, ended in the deſtruction of his accomplices. Hiſtiæus made a ſeaſonable retreat to the Ionian

nian ſhore, where he hoped to be received with open arms by his ancient friends. But the Mileſians, remembering his former tyranny, ſhut their gates againſt him. He ſought admiſſion into Chios, but without better ſucceſs. The Leſbians, with much difficulty, lent him eight veſſels, which he employed againſt the enemy in the Euxine; but he was taken by the Perſians, and crucified at Sardis.

Meanwhile the Perſian fleet and army ſurrounded the walls of Miletus. Their fleet, compoſed of Phœnicians, Cilicians, and Egyptians, amounted to ſix hundred ſail; beſides a conſiderable naval force belonging to the iſle of Cyprus, which, having co-operated during one year with the Ionian inſurgents, had recently ſubmitted to Darius. In order to deliberate concerning the means of oppoſing this mighty armament, the Grecians aſſembled in the Panionian council, where it was unanimouſly reſolved, that no attempt ſhould be made to reſiſt the Perſians by land: the citizens of Miletus alone were exhorted to defend their walls to the laſt extremity, under the conduct of Pythagoras, a perſon of great rank and eminence in that republic. While every effort ſhould be exerted for maintaining this ſtrong hold of Ionia, it was determined that the Grecian fleet, the laſt and only hope of the nation, ſhould aſſemble at the ſmall iſland of Ladè, lying off the harbour of Miletus, and offer battle to that of the Perſians. When all their forces were collected at the appointed rendezvous, they amounted to three hundred and fifty-three ſhips, which, containing, each at a medium, a complement of above two hundred men, made the whole amount to a number ſufficiently reſpectable, and which, had they all remained firm and unanimous in the common cauſe, might, perhaps, have rendered them victorious. To determine on the beſt mode of reſiſting the Perſians, a council was convened, in which every individual had full liberty to propoſe his opinion. That of Dionyſius, a Phocæan, met with the approbation of the aſſembly. "Our fortunes," ſaid he, "O Ionians! ſtand on a needle's point. We muſt either vindicate our liberty, or ſuffer the ignominious puniſhment of fugitive ſlaves. If we refuſe preſent labour and danger, we ſhall be expoſed to eternal diſgrace; but the toils of a few days will be compenſated by a life of freedom, of glory, and of happineſs. Submit, therefore, to my direction, and I will pledge my life, that, if the gods declare not againſt us, the enemy will either decline the engagement, or, engaging, be ſhamefully defeated." The Greeks, conſenting to ſubmit to the diſcipline of Dionyſius, he, every day, arranged the fleet in three diviſions, and commanded them often to change their ſtations, habituating the ſailors to the labour of the oar, and the reſtraints of diſcipline, which he aſſured them would, by habit, become eaſy and agreeable. For ſeven days they cheerfully obeyed his commands: but at length the warmth of the ſeaſon rendered their exertions too great for their patience. Diſtempers broke out in the fleet. The Greeks, always averſe to every ſhadow of abſolute authority, complained at firſt in ſecret murmurs, and afterwards in licentious clamours, of the intolerable hardſhips to which they were expoſed by the inſolent Phocæan, who, though he brought only three ſhips to the common defence, had aſſumed an arbitrary direction in all their affairs. Governed by theſe ſentiments, they refuſed any longer to obey his commands, landed on the ſhore of Ladè, formed a camp on the iſland, and, ſitting under the ſhade of their tents, diſdained any further co-operation. The Samians, who ſaw and dreaded the conſequence of this general diſorder, privately accepted a propoſal which had been made them by the Perſians. Their perfidy brought deſtruction on the common cauſe; for in the engagement, which followed ſoon after, they hoiſted ſail and deſerted the line. The Leſbians followed their example. Among thoſe, however, who obtained ſignal honour by adhering to the cauſe of Greece, were eleven captains of Samian veſſels, who deteſted the treachery of their companions, and deſpiſed the ſigns of their admirals; on which account they were rewarded, at their return, by the community of Samos, with a pillar and inſcription, tranſmitting their names, with immortal renown, to poſterity. But of all the Greeks, the Chians acquired the greateſt glory on that memorable day: notwithſtanding their inferior ſtrength, they defended themſelves to the laſt extremity, and rendered the victory late and dear to the Perſians. The naval defeat was ſoon followed by the taking of Miletus, which ſurrendered in the ſixth year from the commencement of the revolt. The Perſians made good the threats which they had denounced againſt the obſtinacy of their enemies. Samos alone, as the price of its perfidy, obtained the ſafety of its houſes and temples. Thoſe of all the other communities were burnt to the ground. The women and children were dragged into captivity. Such of the Mileſian citizens as eſcaped not by flight, were either put to the ſword, or carried into the heart of Aſia, and finally ſettled in the territory of Ampè, near the mouth of the Tigris. The Perſian fleet wintered at Miletus, and next ſpring ſubdued the iſlands of Chios, Leſbos, and Tenedos; while Darius prepared to carry the war into the heart of Greece.

The execution of his deſign was entruſted to Mardonius, a Perſian nobleman, who had married Artazoſtra, the daughter of Darius. In the year before Chriſt 493, Mardonius approached the European coaſt with an armament ſufficient to inſpire terror into Greece. The rich iſland of Thaſus, whoſe golden mines yielded a revenue of near three hundred talents, ſubmitted to his fleet; while his land forces added the province of Macedon to the Perſian empire. But having ſteered ſouthward from Thaſus, the whole armament was almoſt deſtroyed by a ſtorm. Three hundred veſſels were daſhed againſt the rocks, and twenty thouſand men periſhed in the ſea. This diſaſter wholly defeated the deſign of the expedition; and Mardonius, having recovered the ſhattered remains of the fleet and army, returned to the court of Perſia, where, by flattering the pride, he in ſome meaſure averted the reſentment of Darius. Two generals were appointed in his room, of whom Datis, a Mede, was the more diſtinguiſhed by his age and experience, while Artaphernes, a Perſian, was the more conſpicuous for his rank, being the ſon of Artaphernes governor of Sardis. Darius now aſſembled an army of five hundred thouſand men, conſiſting of the flower of the troops of his extenſive empire. The maritime provinces of the empire, Egypt, Phœnicia, and the coaſts of the Euxine and Ægean ſeas, were commanded to fit out, with all poſſible expedition, their whole naval ſtrength; and in the courſe of the year a fleet of ſix hundred ſail was ready to put to ſea. This immenſe armament enjoyed a proſperous voyage to the iſle of Samos, from whence they were ready to proceed to the Athenian coaſt. The late diſaſter which befel the fleet commanded by Mardonius, deterred them from purſuing a direct courſe along the ſhores of Thrace and Macedonia: they determined to ſteer in an oblique line through the Cyclades, a cluſter of ſeventeen iſlands, lying oppoſite to the territories of Argos and Attica. The approach of ſuch an innumerable hoſt, whoſe tranſports darkened the broad ſurface of the Ægean Sea, ſtruck terror into the inhabitants of thoſe delightful iſlands. The Naxians took refuge in their inacceſſible mountains; the natives of Delos, the favourite reſidence of Latona, abandoned the awful majeſty of their temple, which was overſhadowed by the rough and lofty mount Cynthus. Paros, famous for its marble; Andros, celebrated for its vines; Ceos, the birthplace of Simonides; Syros, the native country of the philoſophic Pherecydes; Ios, the tomb of Homer; the fertile Amorgos; as well as all the other iſlands which

ſurrounded the once-ſacred ſhores of Delos, either ſpontaneouſly offered the uſual acknowledgment of earth and water, as a teſtimony of their friendſhip, or ſubmitted, after a feeble reſiſtance, to the Perſian arms. The invaders then proceeded weſtward to the iſle of Eubœa, where, after a continued engagement of ſix days, their ſtrength and numbers, aſſiſted by the perfidy of two traitors, finally overcame the valour and obſtinacy of the Eretrians.

After burning the city of Eretria, the Perſian generals ſet ſail from Eubœa, and ſafely arrived on the *Marathonian ſhore*, a diſtrict of Attica about thirty miles from the capital. Here the Perſians pitched their camp, by the advice of Hippias, the baniſhed king of Athens, whoſe perfect knowledge of the country, and intimate acquaintance with the affairs of Greece, rendered his opinion on all occaſions reſpectable. Meanwhile the Athenians had raiſed an army, and appointed ten generals, with equal power, choſen from the ten tribes into which the citizens were divided. Their obſtinate and almoſt continual hoſtilities with the Phocians, the Thebans, and their other northern neighbours, prevented them from entertaining any hopes of aſſiſtance from that quarter: but, on the firſt appearance of the Perſian fleet, they ſent a meſſenger to Sparta, to acquaint that republic with the immediate danger that threatened them, and to explain how much it concerned the intereſt, as well as the honour, of the Spartans, who had acquired juſt pre-eminence among the Grecian ſtates, not to permit the deſtruction of the moſt ancient and the moſt ſplendid of the Grecian cities. The ſenate and aſſembly, approving the juſtice of the demand, collected their troops, and ſeemed ready to afford their rivals, whoſe danger now converted them into allies, a ſpeedy and effectual relief. The Athenians had alſo been reinforced by a thouſand choſen warriors from Platæa, a ſmall city of Bœotia, diſtant only nine miles from Thebes. The Athenian army, now ready to take the field, conſiſted of about ten thouſand freemen, and of probably a ſtill greater number of armed ſlaves. The generals might certainly have collected a larger body of troops; but they ſeem to have been averſe to commit the ſafety of the ſtate to the fortune of a ſingle engagement; neither would it have been prudent to leave the walls of Athens, and the other fortreſſes of Attica, altogether naked and defenceleſs. But though the Athenians were few in number, they were choſen men; and their conſtant exerciſe in war had inured them to hardſhip and fatigue, accuſtomed them to ſtrict diſcipline, and familiariſed them to thoſe ſkilful evolutions which often decide the fortune of the field.

The Perſians, comprehending the various nations which followed the ſtandard of Datis and Artaphernes, were not deficient in martial appearance, nor deſtitute of valour, being ſelected with care from the flower of the Aſiatic provinces. But, compared with the regularity of the Greek battalions, they may be regarded as a promiſcuous crowd, armed in each diviſion with the peculiar weapons of their reſpective countries, incapable of being harmonized by general movements, or united into any uniform ſyſtem of military arrangement. Darts and arrows were their uſual inſtruments of attack; and even the moſt completely armed truſted to ſome ſpecies of miſſile weapon. They carried in their left hands light targets of reed or oſier, and their bodies were covered with thin plates of ſcaly metal; but they had not any defenſive armour worthy of being compared with the firm corſelets, the brazen greaves, the maſſy bucklers, of their Athenian opponents. The braveſt of the barbarians fought on horſeback; but in all ages the long Grecian ſpear has proved the ſureſt defence againſt the attack of cavalry; inſomuch that even the Romans, in fighting againſt the Numidian horſemen, preferred the ſtrength of the phalanx to the activity of the legion.

Miltiades allowed not, however, his contempt of the enemy, or his confidence in his own troops, to ſeduce him into a fatal ſecurity. But the Athenians, as already obſerved, having elected ten generals, who were inveſted, each in his turn, with the ſupreme command, was extremely unfavourable to that unity of deſign which ought to pervade all the ſucceſſive operations of an army; an inconvenience which ſtruck the diſcerning mind of Ariſtides, who on this occaſion diſplayed the firſt openings of his illuſtrious character. The day approaching when it belonged to him to aſſume the command, he generouſly yielded his authority to the approved valour and experience of Miltiades. The other generals followed this magnanimous example; and the commander in chief thus enjoyed an opportunity of exerting the utmoſt vigour of his genius. Leſt he ſhould be ſurrounded by a ſuperior force, he choſe for his camp the declivity of a hill, diſtant about a mile from the encampment of the enemy. The intermediate ſpace he cauſed to be ſtrewed in the night with the branches and trunks of trees, in order to interrupt the motion, and break the order, of the Perſian cavalry, which in conſequence of this precaution, ſeem to have been rendered incapable of acting in the engagement. In the morning his troops were drawn up in battle array, in a long and full line; the braveſt of the Athenians on the right, on the left the warriors of Platæa, and in the middle the ſlaves, who had been admitted on this occaſion to the honour of bearing arms. By weakening his centre, the leaſt valuable part, he extended his front equal to that of the enemy: his rear was defended by the hill above-mentioned, which, verging round to meet the ſea, likewiſe covered his right; his left was flanked by a lake or marſh. Datis, although he perceived the ſkilful order of the Greeks, was yet too confident in the ſuperiority of his numbers to defer the engagement, eſpecially as he now enjoyed an opportunity of deciding the conteſt before the expected auxiliaries could arrive from Peloponneſus. The inſtant the Athenians ſaw the enemy in motion, they ran down the hill with unuſual ardour to encounter them; a circumſtance which proceeded perhaps from their eagerneſs to engage, but which muſt have been attended with the good conſequence of ſhortening the time of their expoſure to the ſlings and darts of the enemy.

The two armies cloſed; the battle was rather fierce than long. The Perſian ſword and Scythian hatchet penetrated, or cut down, the centre of the Athenians; but the two wings, which compoſed the main ſtrength of the Grecian army, broke, routed, and put to flight, the correſponding diviſions of the enemy. Inſtead of purſuing the vanquiſhed, they cloſed their extremities, and attacked the barbarians who had penetrated their centre. The Grecian ſpear overcame all oppoſition: the braveſt of the Perſians periſhed in the field; the remainder were purſued with great ſlaughter; and ſuch was their terror and ſurpriſe, that they ſought for refuge, not in their camp, but in their ſhips. The tyrant Hippias fell in the engagement: two Athenian generals, and about two hundred citizens, were found among the ſlain: the Perſians left ſix thouſand of their beſt troops in the field of battle; and probably a ſtill greater number were killed in the purſuit. The Greeks followed them to the ſhore; but the lightneſs of the barbarian armour favoured their eſcape. Seven ſhips were taken; the reſt ſailed with a favourable gale, doubled the cape of Sunium; and, after a fruitleſs attempt to ſurpriſe the harbour of Athens, returned to the coaſt of Aſia, A. C. 490.

The loſs and diſgrace of the Perſians on this memorable occaſion, was compenſated by only one conſolation. They had been defeated in the engagement, compelled to abandon their camp, and driven ignominiouſly to their ſhips; but they carried with them to Aſia the Eretrian priſoners, who, in obedience to the orders of Darius,

MILTIADES.

London, Published as the Act directs. Sept.r 5. 1807, by J. Wilkes.

Darius, were ſafely conducted to Suſa. Theſe unhappy men had every reaſon to dread being treated as victims of royal reſentment; but, when they were conducted in chains to the preſence of the great king, their reception was very different from what their fears naturally led them to expect. Whether reflection ſuggeſted to Darius the pleaſure which he might derive in peace, and the aſſiſtance which he might receive in war, from the arts and arms of the Eretrians, or that a ray of magnanimity for once enlightened the ſoul of a deſpot, he ordered the Greeks to be immediately releaſed, and aſſigned them for their habitation the fertile diſtrict of Anderica, lying in the province of Ciſſia in Suſiana, at the diſtance of only forty miles from the capital. There the colony remained in the time of Herodotus, preſerving their Grecian language and inſtitutions; and after a revolution of ſix centuries, their deſcendants were viſited by Apollonius Tyaneus, the celebrated Pythagorean philoſopher, and were ſtill diſtinguiſhed from the ſurrounding nations by the indubitable marks of European extraction.

The death of Darius retarded for ten years a reſolution which he had formed, and which was adopted by his ſon and ſucceſſor Xerxes, of reſtoring the luſtre of the Perſian arms, not only by taking vengeance on the Athenians, but by effecting the complete conqueſt of Europe. The joy excited in the mean time among the Athenians by a victory, which not only delivered them from the dread of their enemies, but raiſed them to diſtinguiſhed pre-eminence among their rivals and allies, was conſpicuous in every part of Attica; and the magnificent encomiums beſtowed on Miltiades in the preſence of his aſſembled countrymen, fired with emulation the young candidates for fame, while they enabled the general to obtain that mark of public confidence and eſteem which was the utmoſt ambition of all the Grecian leaders. But though theſe leaders, while they remained within the territories of their reſpective ſtates, were entruſted with only that moderate authority which ſuited the equal condition of freedom; yet, when they were appointed to the command of the fleet in foreign parts, they obtained almoſt unlimited power, and might acquire immenſe riches. To this exalted ſtation Miltiades was now advanced; and having ſailed with a fleet of ſeventy gallies, the whole naval ſtrength of the republic, he determined to expel the Perſian garriſons from the iſles of the Ægean; to reduce the ſmaller communities to the obedience of Athens, and to ſubject the more wealthy and powerful to heavy contributions.

The firſt operations of the Athenian fleet were crowned with ſucceſs: ſeveral iſlands were ſubdued, conſiderable ſums of money were collected. But the fleet arriving before Paros, every thing proved adverſe to the Athenians. Miltiades, who had received a perſonal injury from Tiſagoras, a man of great authority in that iſland, yielded to the dictates of private reſentment, and confounding the innocent with the guilty, demanded from the Parians the ſum of an hundred talents, near twenty thouſand pounds ſterling. If the money were not immediately paid, he threatened to lay waſte their territory, to burn their city, and to teach them by cruel experience the ſtern rights of a conqueror. The exorbitancy of the demand rendered compliance with it impoſſible; and the Parians prepared for their defence. For twenty-ſix days they maintained poſſeſſion of the capital of the iſland, which the Athenians, after ravaging all the adjacent country, beſieged by ſea and land. The time now approached when Paros muſt have ſurrendered; but it was the good fortune of the iſlanders, that an extenſive grove, which happened to be ſet on fire in one of the Sporades, was believed by the beſiegers to indicate the approach of the Perſian fleet. The ſame opinion gained ground among the Parians, who determined, by their utmoſt efforts, to preſerve the place, until they ſhould be relieved by the aſſiſtance of their protectors. Miltiades had received a dangerous wound during the ſiege; and the weakneſs of his body impairing the faculties of his mind, he gave orders to draw off his troops, and returned with the whole fleet to Athens. His conduct in this expedition ill correſponded to his former fame; and he ſoon experienced the inſtability of popular favour. The Athenian citizens, and particularly the more eminent and illuſtrious, had univerſally their rivals and enemies. Xantippus, a perſon of great diſtinction, and father of the celebrated Pericles, eagerly ſeized an opportunity of depreſſing the character of a man which had ſo long eclipſed that of every competitor. Miltiades was accuſed of being corrupted by a Perſian bribe to raiſe the ſiege of Paros; the precipitancy with which he abandoned the place, ſo unlike to the general firmneſs of his manly behaviour, gave a probable colour to the accuſation; and his enemies loudly inſiſted that the crime deſerved death. But his judges were contented with fining him the ſum of fifty talents, or ten thouſand pounds ſterling, which being unable to pay, he was thrown into priſon, where he ſoon expired of his wounds. But the glory of Miltiades ſurvived him; and the Athenians, however unjuſt to his perſon, were not unmindful of his fame. At the diſtance of half a century, when the battle of Marathon was painted by order of the ſtate, they directed the figure of Miltiades to be placed in the fore-ground, animating the troops to victory; a reward which, during the virtuous ſimplicity of the ancient commonwealth, conferred more real honour than all that magnificent profuſion of crowns and ſtatues, which in the later times of the republic were rather extorted by fear, than beſtowed by admiration.

Ariſtides and Themiſtocles, who were now looked up to as beſt qualified to ſucceed Miltiades, were nearly of the ſame age, and of equal dignity in the firſt rank of citizens. Ariſtides was eminently diſtinguiſhed by valour and moderation; and he had learned to prefer glory to pleaſure; the intereſt of his country to his own perſonal advantage; and the dictates of juſtice and humanity, even to the intereſts of his country. The character of Themiſtocles was of a more doubtful kind. The trophy which Miltiades had raiſed at Marathon diſturbed his reſt. He was inflamed with a deſire to emulate the glory of this exploit; and while he enabled Athens to maintain a ſuperiority in Greece, he was ambitious to acquire for himſelf a ſuperiority in Athens; and hiſtory ſtill leaves it queſtionable, whether, had an opportunity offered, he would not have ſacrificed the happineſs of his country to his private intereſt and ambition. The diſcernment of Ariſtides perceived the danger of allowing a man of ſuch equivocal merit to be entruſted with the ſole government of the republic; and on this account, rather than from any motives of perſonal animoſity, he oppoſed every meaſure that might contribute to his elevation. In this patriotic view, he frequently ſolicited the ſame honours which were ambitiouſly courted by Themiſtocles; yet the intereſt of Themiſtocles ſo far prevailed over the authority of his opponent, that he procured his own nomination to the command of the fleet; with which he ſoon effected the conqueſt of the iſlands in the Ægean Sea, and thus completed the deſign undertaken by Miltiades. But while he acquired fame and fortune abroad, Ariſtides increaſed his popularity at home. The oppoſition to his power, ariſing from the ſplendid eloquence and popular manners of his rival, was now removed, and he became the chief leader of the people. His opinion gave law to the courts of juſtice, or rather ſuch was the effect of his equity and diſcernment, that he alone became ſovereign umpire in Athens.

On the triumphant return of Themiſtocles, however, from his naval expedition, the high reputation of Ariſtides began to ſink in the minds of the people. The admiral had acquired conſiderable riches; but wealth he

he deſpiſed, except as an inſtrument of ambition. The ſpoils of the conquered iſlanders were profuſely laviſhed in ſhows, feſtivals, dances, and theatrical entertainments, exhibited for the public amuſement. His generous manners and flowing affability were contraſted with the ſtern morality of his rival; and the reſult of the compariſon added great force to his inſinuation, that, ſince his own neceſſary abſence in the ſervice of the republic, Ariſtides had acquired a degree of influence inconſiſtent with the conſtitution, and, by arrogating to himſelf an unexampled juriſdiction in the ſtate, had eſtabliſhed a ſilent tyranny over the minds of his fellow-citizens. Ariſtides, truſting to the innocence and integrity of his own heart, diſdained to employ any unworthy means, either for gaining the favour, or for averting the reſentment, of the multitude. The conteſt, therefore, ended in his baniſhment for ten years, by a law intitled the *Oſtraciſm*, by which the majority of the Athenian aſſembly might expel any citizen, however inoffenſive or meritorious had been his paſt conduct, who, by his preſent power and greatneſs, ſeemed capable of diſturbing the equality of republican government. Thus only four years after the battle of Marathon, in which he had diſplayed uncommon valour and wiſdom, Ariſtides, the juſteſt and moſt reſpectable of the Greeks, became the victim of popular jealouſy; an example of cruel rigour, which will for ever brand the ſpirit of democratical policy.

The baniſhment of Ariſtides expoſed the Athenians ſtill more to the danger which they hoped to avoid by this ſevere meaſure. The removal of ſuch a formidable opponent enabled Themiſtocles to govern without controul. Army, navy, and revenue, all were ſubmitted to his inſpection. It happened, indeed, moſt fortunately for the fame of this great man, as well as for the liberty of Athens, that his active ambition was called to the glorious taſk of ſubduing the enemies of his country. The ſmaller iſlands in the Ægean were already reduced; but the poſſeſſion of them was uncertain while the fleet of Ægina covered the ſea, and bade defiance to that of the Athenians. This iſland, inhabited time immemorial by merchants and pirates, and ſituate in the Saronic Gulf, which divides the territories of Attica from the northern ſhores of Peloponneſus, was a formidable enemy to the republic, which Themiſtocles nobly offered to deſtroy. The propoſal was approved; an hundred gallies were equipped; the naval ſtrength of Ægina was broken, and ſucceſs animated the Athenians to aſpire at obtaining the unrivalled empire of the ſea. Corcyra formed the only remaining obſtacle to their ambition. This iſland, which, under the name of Phœacia, is celebrated by Homer for its amazing richneſs and fertility, had been ſtrengthened and improved by a colony of Corinthians, who became ſucceſſively the rivals, the enemies, and the ſuperiors, of Corinth, their mother-country. Their ſucceſsful cruiſers had long infeſted the coaſts of the iſlands and continent of Greece; it therefore belonged to Athens to chaſtiſe the inſolence of the Corcyrians; and Themiſtocles, when by ſeizing part of their fleet he broke the ſinews of their power, not only gratified the ambition of the republic, but performed a ſignal ſervice to the whole Grecian confederacy. Thus victorious by ſea and land, Athens now thought to enjoy the fruits of a glorious ſecurity, when the moſt formidable tidings arrived of the threatened attack of Xerxes, with a vaſt armament, and a more powerful fleet than any hitherto known in Greece.

Nine years after the battle of Marathon, and in the fourth year of his reign, Xerxes found himſelf poſſeſſed of an armament adequate to the extent of his ambition. Twelve hundred ſhips of war, and three thouſand ſhips of burthen, were ready to receive his commands. The former were of a larger ſize and firmer conſtruction than any hitherto ſeen in the ancient world. When the army had attained its perfect complement, we are told that it conſiſted of ſeventeen hundred thouſand infantry, and four hundred thouſand cavalry; which, joined to the fleet above-mentioned, made the whole forces amount to near two millions of fighting men. An immenſe crowd of women and eunuchs followed the camp of this effeminate people. Theſe inſtruments of pleaſure and luxury, together with the ſlaves neceſſary in tranſporting the baggage and proviſions, equalled, perhaps exceeded, the number of the ſoldiers; ſo that, according to the univerſal teſtimony of ancient hiſtorians, the army of Xerxes appears the greateſt that was ever collected.

Xerxes, having wintered at Sardis, ſent ambaſſadors early in the ſpring of the year before Chriſt 480, to demand earth and water, as a mark of ſubmiſſion, from the ſeveral Grecian republics. With regard to Athens and Sparta, he thought it unneceſſary to obſerve this ceremony, as they had cruelly treated and put to death the meſſengers formerly intruſted with a ſimilar commiſſion by his father Darius. The ſlow march of his immenſe army, and, ſtill more, its tedious tranſportation acroſs the ſea, induced Xerxes to order a bridge of boats to be raiſed on the Helleſpont, which, in the narroweſt part, is only ſeven ſtadia, or ſeven-eighths of a mile, in breadth; but whether owing to the awkwardneſs of its conſtruction, or to the violence of a ſucceeding tempeſt, it was no ſooner built than deſtroyed. The great king ordered the directors of the work to be beheaded; and, proud of his tyrannic power over feeble man, diſplayed an impotent rage againſt the elements. In the madneſs of deſpotiſm he commanded the Helleſpont to be puniſhed with three hundred ſtripes, and a pair of fetters to be dropped into the ſea, adding theſe ridiculous expreſſions: "It is thus, thou ſalt and bitter water, that thy maſter puniſhes thy unprovoked injury, and he is determined to paſs thy treacherous ſtreams notwithſtanding all the inſolence of thy malice." After this ceremony, a new bridge was made of a double range of veſſels, fixed by ſtrong anchors on both ſides, and joined together by cables faſtened to immenſe beams driven into the oppoſite ſhores. The decks of the veſſels, which exceeded ſix hundred in number, were ſtrewed with trunks of trees and earth, and their ſurface ſmoothed by a covering of planks. The ſides were then railed with wicker-work, to prevent the fear and impatience of the horſes; and, upon this ſingular edifice, the main ſtrength of the army paſſed in ſeven days and nights, from the Aſiatic city of Abydos to that of Seſtos in Europe.

A conſiderable part of the Perſian forces had been ſent to the coaſt of Macedonia, in order to dig acroſs the iſthmus which joins to that coaſt the promontory of Athos. The diſaſter which befel the fleet commanded by Mardonius, in doubling the cape of this peninſula, was ſtill freſh in the mind of Xerxes. The neck of land, only a mile and a half in breadth, contained the Grecian city of Sana; and the promontory being rich and fertile, was well inhabited by both Greeks and barbarians. The cutting through this narrow iſthmus, by a canal of ſufficient width to allow two gallies to ſail abreaſt, was a matter by no means difficult to a potentate who commanded the labour of ſo many myriads.

Through the fertile plains of Leſſer Aſia the whole army had kept in a body; but the difficulty of ſupplies obliged them to ſeparate into three diviſions in their march through the leſs cultivated countries of Europe. Before this ſeparation took place, the whole fleet and army were reviewed by Xerxes, near Doriſcus, a city of Thrace, at the mouth of the Hebrus. On this occaſion Xerxes converſed with Demaratus, the baniſhed king of Sparta, who had ſought refuge in the Perſian court from the perſecution of his countrymen. This memorable interview between them is deſcribed by Herodotus. The Perſian, diſplaying oſtentatiouſly the magnitude of his power, aſked the royal fugitive, Whether he ſuſ-

pected the Greeks would dare to take the field, in order to oppoſe the progreſs of his arms? Demaratus replied, that "Greece had been trained in the ſevere but uſeful ſchool of neceſſity; poverty was her nurſe and her mother; ſhe had acquired patience and valour by the early application of diſcipline; and ſhe was habituated to the practice of virtue by the watchful attention of the law. All the Greeks were warlike, but the Spartans were peculiarly brave. It was unneceſſary to aſk their number, for if they exceeded not a thouſand men, they would defend their country and their freedom againſt the aſſembled myriads of Aſia. Xerxes was rather amuſed than inſtructed by this diſcourſe. His hopes of ſucceſs were built on too ſolid principles to be ſhaken by the opinion of a prejudiced Greek. Every day meſſengers arrived with the ſubmiſſion of new nations. The inhabitants of the rocky country of Doris, many tribes of Theſſaly, the mountaineers of Pindus, Oſſa, Pelion, and Olympus, which like a lofty rampart ſurround that country, offered the uſual preſent of earth and water, as the ſymbol of ſurrendering their territories to a power which it ſeemed vain to reſiſt. Theſe diſtricts formed only the northern frontier of Greece. But what gave peculiar pleaſure to Xerxes, the Thebans who inhabited the central parts, and all the cities of Bœotia, except Theſpiæ and Platæa, privately ſent ambaſſadors to teſtify their ſubmiſſion, and to requeſt the honour of his friendſhip.

Meanwhile thoſe Grecians, unmoved by the terrors of invaſion, reſolutely obeyed the voice of liberty and their country. By one common conſent they ſuſpended their domeſtic animoſities, recalled their fugitives, conſulted their oracles, and diſpatched ambaſſadors, in the name of united Greece, to demand aſſiſtance from the iſlands of Crete, Cyprus, and Corcyra, as well as from the Grecian colonies on the coaſts of Italy and Sicily. All their meaſures were carried on with unanimity and concord. Even the Thebans, careful to conceal their treachery, had ſent repreſentatives to the common council. The general danger ſeemed to unite and harmonize the moſt diſcordant members: and although the perpetual diſſenſions between rival ſtates, frequently weakened the authority of the Amphictyonic confederacy, it appeared on the preſent, as on many other occaſions, that the Greeks acknowledged the obligation of a tacit alliance to defend each other againſt domeſtic tyrants and foreign barbarians.

Before they had an opportunity of learning the will of the gods, or of diſcovering the intentions of their diſtant allies, ambaſſadors arrived from thoſe communities of Theſſaly which ſtill adhered to the intereſt of Greece, praying a ſpeedy and effectual aſſiſtance to guard the narrow paſſes which lead into their country. It was natural for the Theſſalians to expect that the troops of Xerxes would paſs by this inlet into their territories; and hither their ambaſſadors entreated the allied Greeks to ſend an army. The propoſal ſeemed juſt and uſeful; ſhips were prepared at the iſthmus; and a body of ten thouſand men were embarked under the command of Themiſtocles, with orders to ſail through the narrow Euripus, to land in the harbours of Tempè, and remain there in order to guard that important paſs. They had not continued in thoſe parts many days, when a meſſenger arrived from Alexander, ſon of Amyntas, tributary prince of Macedonia, adviſing them to depart from that poſt, unleſs they meant to be trampled under foot by the Perſian cavalry. It is not probable that this menace could have changed their reſolution. But they had learned that there was another paſſage into Theſſaly, through the territory of the Perræbians, near the city Gonnus in Upper Macedonia. Their army was inſufficient to guard both; and the defending of one only, could not be of eſſential advantage to themſelves, or to the Theſſalians. Meantime, the dangers which thickened over the reſpective republics, rendered it neceſſary to return ſouthward. Their diſtant colonies, particularly thoſe of Sicily, which were the moſt numerous and powerful, could not afford any aſſiſtance, being themſelves threatened with a formidable invaſion from the Carthaginians. The oracles were doubtful, or terrifying. To the Spartans they announced, as the only means of ſafety, the voluntary death of a king of the race of Hercules. The Athenians were commanded to ſeek refuge within their wooden walls. The reſponſes given to the other ſtates are not recorded; but it appears in general, that all were dark, ambiguous, or frightful. The Grecian army returned therefore to their ſhips, repaſſed the Euripus, and arrived in ſafety at Corinth; while the Theſſalians, thus abandoned by their allies, were compelled to ſubmit to the common enemy.

The terror inſpired by the critical ſituation of affairs, rendered the preſence of the leaders neceſſary in their reſpective communities. Themiſtocles found the Athenians divided about the meaning of the oracle, the greater part aſſerting, that by wooden walls was underſtood the incloſure of the citadel, which had been formerly ſurrounded by a palliſade. Others gave the words a different conſtruction, and each according to his fears or his intereſt; but Themiſtocles aſſerted that all of them had miſtaken the advice of the god, who deſired them to truſt for ſafety to their fleet. This opinion, ſupported by all the force of his eloquence, and the weight of his authority, at length prevailed. The Athenian gallies were fitted out with all convenient ſpeed, and being joined with thoſe of Eubœa, Ægina, Corinth, and the maritime allies of Peloponneſus, amounted to a fleet of three hundred ſail. They proceeded to the narrow ſea which divides the northern ſhore of Eubœa from the coaſt of Theſſaly, rendezvouſed at the promontory of Artemiſium, and patiently waited the arrival of the Perſians.

Beſides the force neceſſary for manning this fleet, the confederates could raiſe an army of about ſixty thouſand freemen, beſides a ſtill greater proportion of armed ſlaves. As the paſſes leading from Theſſaly to the territories of Phocis and Locris were ſtill narrower and more difficult of acceſs than thoſe from Macedon into Theſſaly, it ſeems extraordinary, that they did not immediately direct their whole military ſtrength towards that quarter. As they were acquainted with only one paſs, by which the Perſians could arrive from Theſſaly, they thought that a body of eight thouſand pike-men might be equally capable with a larger proportion of troops to defend it againſt every invader. This narrow defile was called the Straits of Thermopylæ, in alluſion to the warm ſprings in that neighbourhood, and was deemed the gate or entrance into Greece. It was bounded on the weſt by high and inacceſſible precipices which join the lofty ridge of mount Oeta; and on the eaſt terminated by an impracticable moraſs, bordered by the ſea. Near the plain of the Theſſalian city of Trachis, the paſſage was fifty feet broad; but at Alpené, there was not room for one chariot to paſs another. Even theſe paſſes were defended by walls, formerly built by the Phocians to protect them againſt the incurſions of their enemies in Theſſaly, and ſtrengthened, on this occaſion, with as much care as time would allow. The troops ſent to Thermopylæ, which was only fifteen miles diſtant from the ſtation of the Grecian fleet at Artemiſium, conſiſted chiefly of Peloponneſians, commanded by Leonidas the Spartan king, who was prepared, in obedience to the oracle, to devote his life for the ſafety of his country.

In the warmth of indignation, the Spartans, as already obſerved, had put to death the Perſian heralds ſent to demand their ſubmiſſion; but, upon cool reflection, they were prompted to make atonement for this violation of the ſacred law of nations. When proclamation was made in the aſſembly, "Who would die for

Sparta?" two citizens, of great rank and eminence, offered themſelves as willing ſacrifices for the good of the community. Sperthies and Bulis, (for theſe were their names,) ſet out for Suſa on this ſingular errand. When they came to Suſa, the guards told them, that, when admitted into the preſence of Xerxes, they muſt obſerve the uſual ceremony of proſtrating themſelves on the ground. But the Spartans declared, "That no degree of violence could make them ſubmit to ſuch mean adulation: that they were not accuſtomed to adore a man, and came not thither for ſuch an impious purpoſe." They approached Xerxes, therefore, in an erect poſture, and told him with firmneſs they were ſent to ſubmit to any puniſhment which he might think proper to inflict on them, as an atonement for the death of his heralds. Xerxes, admiring their virtue, replied, "That he certainly ſhould not repeat the error of the Greeks, nor, by ſacrificing individuals, deliver the ſtate from the guilt of murder and impiety." The Spartans having received this anſwer, returned home, perſuaded that they had done their duty in offering private ſatisfaction; which, though not accepted, ought ſufficiently to atone for the public crime. The example of theſe diſtinguiſhed patriots probably gave Xerxes a very favourable idea of the general character of their community. As he had not any particular quarrel with the Spartans, whoſe oppoſition, though it could not prevent, would certainly retard, his intended puniſhment of Athens, he ſent meſſengers to deſire them to lay down their arms; to which they replied, "Let him come, and take them." The meſſengers then offered them lands, on condition of their becoming allies to the great king; but they anſwered, "That it was the cuſtom of their republic to conquer lands by valour, not to acquire them by treachery." The meſſengers of Xerxes, equally aſtoniſhed at what they ſaw and heard, returned to the Perſian camp, and deſcribed the unexpected event of their commiſſion, as well as the extraordinary behaviour of the Spartans; of which Xerxes deſired an explanation from their countryman Demaratus. The latter declared in general, that their whole carriage and demeanour announced a determined reſolution to fight to the laſt extremity; but he found it difficult to make the Perſian conceive the motives of men, who fought, at the certain price of their own lives, to purchaſe immortal renown for their country.—That a few individuals ſhould be animated, on ſome extraordinary occaſions, with this patriotic magnanimity, may eaſily be underſtood; but that a whole nation ſhould be impreſſed with the ſame generoſity of character, could not readily be believed, without reflecting on the inſtitutions and manners of the Spartans; whereby it may be ſeen, that as the law which commanded them to die rather than break their ranks, or abandon their poſts in battle, was, like all the ordinances of Lycurgus, conceived to be of divine authority, the influence of ſuperſtition conſpired with the ardour of patriotiſm, in preparing them to meet certain death in the ſervice of the public.

Xerxes could not however be made to enter into theſe motives, or to believe, as Herodotus obſerves with inimitable ſimplicity, "that the Grecians were come to Thermopylæ only as men deſirous to die, and to deſtroy as many of their enemies as they could;" though nothing was more true. He therefore waited four days, continually expecting they would either retreat into their own country, or ſurrender their arms agreeably to his meſſage. But as they ſtill continued to guard the paſſage, he aſcribed this conduct to obſtinacy or folly; and on the fifth day determined to chaſtiſe their inſolence.

The Medes and Ciſſians, who, next to the Sacæ and Perſians, formed the braveſt part of his army, were commanded to attack theſe obſtinate Greeks, and bring them alive into his preſence. The barbarians marched with confidence to the engagement, but were repulſed with great ſlaughter. The places of thoſe who fell were inceſſantly ſupplied with freſh troops, but they could not make the ſmalleſt impreſſion on the firm battalions of the Greeks; and the great loſs which they ſuſtained in the attempt, proved to all, and particularly to the king, that he had indeed many men, but few ſoldiers. The Sacæ, armed with their hatchets, next marched to the attack, but without better ſucceſs; and, laſt of all, the choſen band of Perſians, headed by Hydarnes, a ſon of Darius, deigned to diſplay their valour in what appeared to them a very trifling conteſt. But they ſoon changed their opinion when they came to cloſe with the enemy; for, ſays Herodotus, their numbers were uſeleſs, as they fought in a narrow paſs, and their ſhort-pointed weapons were ill calculated to contend with the long Grecian ſpear. The Greeks had the advantage ſtill more in the ſuperiority of their diſcipline, than in the excellence of their armour. Tired with deſtroying, they retreated in cloſe order, and when purſued unguardedly by the barbarians, they faced about on a ſudden, and killed an incredible number of the Perſians, with ſcarcely any loſs to themſelves. Xerxes, who was ſeated on an eminence to behold the battle, frequently ſtarted in wild emotion from his throne; and, fearing leſt he ſhould be deprived of the flower of his army, he ordered them to be drawn off from the attack. But as the Grecian numbers were ſo extremely inconſiderable, and as it ſeemed probable that the greateſt part of them muſt have ſuffered much injury in theſe repeated aſſaults, he determined next day to renew the engagement. Next day he fought without better ſucceſs; and after vainly endeavouring to force the paſs, both in ſeparate bodies and with the collected vigour of their troops, the Perſians were compelled to abandon the enterpriſe, and diſgracefully to retire to their camp.

It was a ſpectacle which the world had never ſeen before, and which it was never again to behold, the perſevering intrepidity of eight thouſand men reſiſting the impetuous fury of an army compoſed of millions. The unconquerable valour of Leonidas, and of his little troop, oppoſed, and might have long retarded, the progreſs of the barbarians. But it was the fate of Greece, always to be injured rather by the treachery of falſe friends, than by the force of open enemies. When Xerxes knew not what meaſures to purſue in order to effect his purpoſe, and felt the inconvenience of remaining long in the ſame quarters with ſuch an immenſe number of men, a perfidious Greek, induced by the hopes of reward, offered to remove his difficulties. The name of the traitor was Epialtes, a native of the obſcure diſtrict of Mœlis, which ſeparates the frontiers of Theſſaly and Phocis. His experience of the country made him acquainted with a paſſage through the mountains of Oeta, ſeveral miles to the weſt of that guarded by Leonidas. Over this unfrequented path he undertook to conduct a body of twenty thouſand Perſians, who might aſſault the enemy in the rear, while the main body attacked them in front. By this means whatever prodigies of valour the Greeks might perform, they muſt be finally compelled to ſurrender, as they would be incloſed on all ſides among barren rocks and inhoſpitable deſerts. The plan thus judiciouſly concerted, was carried into immediate execution. On the evening of the ſeventh day after Xerxes arrived at the Straits, twenty thouſand choſen men left the Perſian camp, commanded by Hydarnes, and conducted by Epialtes. All night they marched through the thick foreſts of oak which abound in thoſe parts; and by day-break they advanced near to the top of the hill. But how much were they ſurpriſed to ſee the firſt rays of the morning reflected by the glittering brightneſs of Grecian ſpears and helmets! Hydarnes was afraid that this guard, which ſeemed at no great diſtance, had been alſo compoſed of Lacedæmonians; but a nearer approach

ſhewed that they conſiſted of a thouſand Phocians, whom the foreſight of Leonidas had ſent to defend this important but unknown paſs, which chance or treachery might diſcover to the Perſians. The thick ſhade of the trees long concealed the enemy from the Greeks; at length the ruſtling of the leaves, and the tumult occaſioned by the motion of twenty thouſand men, diſcovered their approach. The Phocians with great intrepidity flew to their arms, and prepared, if they ſhould not conquer, at leaſt to die gallantly. The compact firmneſs of their ranks, which might have reſiſted the regular onſet of the enemy, expoſed them to ſuffer much from the immenſe ſhower of darts which the Perſians poured upon them. To avoid this danger, they too raſhly abandoned the paſs which they had been ſent to guard, and retired to the higheſt part of the mountain, not doubting that the enemy, whoſe ſtrength ſo much exceeded their own, would follow them thither. But in this they were diſappointed; for the Perſians, prudently omitting the purſuit of this inconſiderable party, whom to defeat they conſidered as a matter of little moment, immediately ſeized the paſſage, and marched down the mountain with the utmoſt expedition, in order to accompliſh the deſign ſuggeſted by Epialtes.

Meanwhile, obſcure intimations from the gods had darkly announced ſome dreadful calamity impending on the Greeks at Thermopylæ; but when, or by what means, it did not clearly appear, until a Grecian deſerter, named Tyraſtiades, arrived with information of the march of the Perſians acroſs the mountain. Animated by the love of his country, this generous fugitive had no ſooner diſcovered the treacherous deſign of Epialtes, than he determined, at the riſk of his life, and ſtill more at the riſk of being ſubjected to the moſt excruciating tortures, to communicate his diſcovery to the Spartan king. Zeal for the ſafety of Greece gave ſwiftneſs to his ſteps, and he appeared in the Grecian camp a few hours after the Perſians, conducted by Epialtes, had left the plains of Trachis. Leonidas immediately called a council of war, to deliberate upon the meaſures neceſſary to be taken. All the confederates of Peloponneſus, except the Spartans, declared their opinion that it was neceſſary to abandon a poſt, which, after the double attack announced to them ſhould take place, it would be impoſſible with any hopes of ſucceſs to maintain. As their exertions could not be of any avail to the public cauſe, it was prudent to conſult their private ſafety; and while time was yet allowed them, to retire to the iſthmus of Corinth, where joining the reſt of the auxiliaries, they might be ready to defend the Grecian peninſula againſt the fury of the barbarians. It belonged to Leonidas to explain the ſentiments of the Spartans. The other inhabitants of Peloponneſus, he obſerved, might follow the dictates of expediency, and return to the iſthmus, in order to defend their reſpective territories; but glory was the only voice which the Spartans had learned to obey. Placed in the firſt rank by the general conſent of their country, they would rather die than abandon the poſt of honour; and they were determined, therefore, at the price of their lives, to purchaſe immortal renown, to confirm the pre-eminence of Sparta, and to give an example of patriotiſm worthy of being admired, if not imitated, by poſterity.

The dread of unavoidable and immediate death deterred the other allies from concurring with this magnanimous reſolution. The Theſpians alone, amounting to ſeven hundred men, declared they would never forſake Leonidas. They were conducted by the aged wiſdom of Demophilus, and the youthful valour of Dithyrambus. As the Theſpians remained at Thermopylæ from principles of diſtinguiſhed bravery, the Thebans were detained by the particular deſire of Leonidas, who was not unacquainted with the intended treachery of their republic. The four hundred men whom that perfidious community had ſent to accompany his expedition, he regarded rather as hoſtages than auxiliaries; nor was he unwilling to employ their doubtful fidelity in a deſperate ſervice. He thought that they might be compelled by force, or ſtimulated by a ſenſe of ſhame, to encounter the ſame dangers to which the Spartans and Theſpians voluntarily ſubmitted; and without diſcovering his ſuſpicion of their treachery, he had a ſufficient pretence for retaining them, while he diſmiſſed his allies of Peloponneſus, becauſe the Theban territories, lying on the north ſide of the iſthmus of Corinth, would neceſſarily be expoſed to hoſtility and devaſtation, whenever the barbarians ſhould paſs the ſtraits of Thermopylæ. Beſides the Theſpians and Thebans, the troops who remained with Leonidas conſiſted of three hundred Spartans, all choſen men.

It was now the dead of night, when the Spartans, headed by Leonidas, marched in a cloſe battalion towards the Perſian camp, with reſentment heightened by deſpair. Their fury was terrible, and rendered ſtill more deſtructive through the defect of barbarian diſcipline; for the Perſians having neither advanced guards, nor a watch-word, nor confidence in each other, were incapable of adopting ſuch meaſures for defence, as the ſudden emergency required. Many fell by the Grecian ſpear, but much greater multitudes by the miſtaken rage of their own troops, by whom, in the midſt of this blind confuſion, they could not be diſtinguiſhed from enemies. The Greeks, wearied with ſlaughter, penetrated to the royal pavilion; but there the firſt alarm of noiſe had been readily perceived, amidſt the profound ſilence and tranquillity which uſually reigned in the tent of Xerxes; the great king had eſcaped, with his favourite attendants, to the farther extremity of the encampment. Even there, all was tumult, and horror, and deſpair; the obſcurity of night increaſing the terror of the Perſians, who no longer doubted that the detachment conducted by Epialtes had been betrayed by that perfidious Greek; and that the enemy, reinforced by new numbers, now co-operated with the traitor, and ſeized the opportunity of aſſailing their camp, after it had been deprived of the diviſion of Hydarnes, its principal chieftain.

The approach of day diſcovered to the Perſians a dreadful ſcene of carnage; but it alſo diſcovered to them that their fears had multiplied the number of the enemy, who now retreated in cloſe order to the ſtraits of Thermopylæ. Xerxes, ſtimulated by the fury of revenge, gave orders to purſue them; and his terrified troops were rather driven than led to the attack. The Grecians, animated by their late ſucceſs, and perſuaded that they could not poſſibly eſcape death on the arrival of thoſe who approached by way of the mountain, bravely halted in the wideſt part of the paſs, to receive the charge of the enemy. The ſhock was dreadful, and the battle was maintained on the ſide of the Greeks with perſevering intrepidity and deſperate valour. After their ſpears were blunted or broken, they attacked ſword in hand, and their ſhort but well-tempered weapons made an incredible havoc. Their progreſs was marked by a line of blood, when a barbarian dart pierced the heart of Leonidas. The conteſt was no longer for victory and glory, but for the ſacred remains of their king. Four times they diſpelled the thickeſt globes of Perſians; but as their unexampled valour was carrying off the prize, the hoſtile battalions were ſeen deſcending the hill, under the conduct of Epialtes. It was now time to prepare for the laſt effort of generous deſpair. With cloſe order and reſolute minds, the Greeks, all collected in themſelves, retired to the narroweſt part of the ſtrait, and took poſt behind the Phocian wall, on a riſing ground, where a lion of ſtone was afterwards erected in honour of Leonidas. As they performed this movement, fortune, willing to afford every occaſion to diſplay their illuſtrious merit, obliged them to contend at once againſt open force and ſecret treachery.

The

The Thebans, whom fear had hitherto reſtrained from defection, ſeized the preſent opportunity to revolt; and approaching the Perſians with outſtretched arms, declared that they had always been their friends; that *their* republic had ſent earth and water, as an acknowledgment of their ſubmiſſion to Xerxes; and that it was with the utmoſt reluctance they had been compelled to reſiſt the progreſs of his arms. As they approached to ſurrender themſelves, many periſhed by the darts of the barbarians; the remainder ſaved a periſhing life, by ſubmitting to eternal infamy. Meanwhile the Lacedæmonians and Theſpians were aſſaulted on all ſides. The neareſt of the enemy beat down the wall and entered by the breaches. Their temerity was puniſhed by inſtant death. In this laſt ſtruggle every Grecian ſhewed the moſt heroic courage; yet if we believe the unanimous report of ſome Theſſalians, and others who ſurvived the engagement, the Spartan Dioneces deſerved the prize of valour. When it was obſerved to him, that the Perſian arrows were ſo numerous, that they intercepted the light of the ſun, he ſaid it was a favourable circumſtance, becauſe the Greeks now fought in the ſhade. The brothers Alpheus and Maron are likewiſe particularized for their generous contempt of death, and for their diſtinguiſhed valour and activity in the ſervice of their country. What theſe and other virtues could accompliſh, the Greeks, both as individuals and in a body, had already performed; but it became impoſſible for them longer to reſiſt the impetuoſity and weight of the darts, and arrows, and other miſſile weapons, which were continually poured upon them; and they were finally not deſtroyed or conquered, but buried under a trophy of Perſian arms. Two monuments were erected near the ſpot where they fell; the inſcription of the firſt announced the valour of a handful of Greeks, who had reſiſted three millions of barbarians: the ſecond was peculiar to the Spartans, and contained theſe memorable words: "Go, ſtranger, and declare to the Lacedæmonians, that we died here in obedience to their divine laws."

Ω ξεινε αγγειλον Λακεδαιμονιοις οτι τηδε
Κειμεθα τοις κεινων ρημασι πειθομενοι. Herodot. vii. ccxxviii.

During the military operations at Thermopylæ, the Grecian fleet was ſtill ſtationed in the harbour of Artemiſium. That of the Perſians, too numerous for any harbour to contain, had anchored in the road that extends between the city of Caſtanæa and the promontory of Sepias, on the coaſt of Theſſaly. The firſt line of their fleet was ſheltered by the heights on the coaſt; but the other lines, to the number of ſeven, rode at anchor, at ſmall intervals, with the prows of the veſſels turned to the ſea. When they adopted this arrangement, the waters were ſmooth, the ſky clear, the weather calm and ſerene; but on the morning of the ſecond day, the ſky began to lour, and the appearance of the heavens grew threatening and terrible. A dreadful ſtorm ſucceeded, which laſted for ſeveral days. The neareſt veſſels were ſaved by hauling under the ſhore: of the more remote many were driven from their anchors; ſome foundered at ſea, others ſplit on the promontory of Sepias, and ſeveral bulged on the ſhallows of Melibæa. Three days the tempeſt raged with unabating fury. Four hundred gallies were deſtroyed by its violence, beſide ſuch a number of ſtoreſhips and tranſports, that the Perſian commanders, ſuſpecting this diſaſter might occaſion the revolt of the Theſſalians, fortified themſelves with a rampart of conſiderable height, wholly compoſed of the ſhattered fragments of the wreck. This bulwark was ſufficient to protect them againſt the irruptions of the Greeks; but it could not defend them againſt the more dangerous fury of the waves. In a ſhort time, therefore, they quitted their inſecure ſtation at Sepias, and with eight hundred ſhips of war, beſides innumerable veſſels of burden, ſailed into the Pegaſean bay, and anchored in the road of Apheté, which lies directly oppoſite to the harbour of Artemiſium.

The Perſians, having now recovered from the terrors of the ſtorm, reſolved to prepare for the engagement. As they entertained no doubt of the victory, they determined not to begin the attack, until they had ſent two hundred of their beſt ſailing veſſels around the iſle of Eubœa, to intercept the expected flight of the enemy through the narrow Euripus. Thus weakened by a conſiderable diminution of their fleet, in addition to their loſſes by the ſtorm, the Grecians conſidered it as a favourable opportunity to diſplay their courage and ſkill in commencing the action. About ſun-ſet they approached in a line, and offered battle to the Perſians. They did not chuſe to decline the engagement, as their ſhips were ſtill ſufficiently numerous to ſurround thoſe of their opponents. At the firſt ſignal the Greeks formed into a circle, at the ſecond they began the fight. Though crowded into a narrow compaſs, and having the enemy on every ſide, they ſoon took thirty of their ſhips, and ſunk many more. Night came on, accompanied with an impetuous ſtorm of rain and thunder; the Greeks retired into the harbour of Artemiſium; the enemy were driven to the coaſt of Theſſaly. As the wind blew from the ſouth, the dead bodies and wrecks daſhed with violence againſt the ſides of their ſhips; ſome were driven on-ſhore; but the principal part had the good fortune again to reach the Pegaſean Bay. *Their* calamities were thought great and unexpected; but the ſhips ordered to ſail round Eubœa were overtaken by the ſtorm; and after continuing during the greateſt part of the night the ſport of the elements, they all periſhed miſerably, amidſt the ſhoals and rocks of that dangerous coaſt.

The morning roſe with different proſpects and hopes to the Perſians and Greeks. To the former it diſcovered the extent of their misfortunes; to the latter it brought a reinforcement of fifty-three Athenian ſhips. Encouraged by this favourable circumſtance, they determined again to attack the enemy, at the ſame hour as on the preceding day, becauſe their knowledge of the coaſt, and their ſkill in fighting their ſhips, rendered the duſk peculiarly propitious to their deſigns. At the appointed time, they ſailed towards the road of Apheté, and having cut off the Cilician ſquadron from the reſt, totally deſtroyed it, and returned at night to Artemiſium. The Perſian commanders, deeply affected with their repeated diſaſters, and greatly alarmed at the much-dreaded reſentment of their king, determined to make one vigorous effort for reſtoring the glory of their arms. By art and ſtratagem, and under favour of the night, the Greeks had hitherto gained many important advantages. It now belonged to the Perſians to chuſe the time for action. On the third day at noon, they ſailed forth in the form of a creſcent, ſufficiently extenſive to infold the whole Grecian line. The Greeks, animated by former ſucceſs, were averſe to decline the battle; yet it is probable that Themiſtocles would much rather have delayed it to a more favourable opportunity. Rage, reſentment, and indignation, ſupplied the defect of the barbarians in ſkill and courage. The battle was longer, and more doubtful, than on any former occaſion; many Grecian veſſels were deſtroyed; five were taken by the Egyptians, who particularly ſignalized themſelves on the ſide of the barbarians, as the Athenians did on that of the Greeks. The perſevering valour of the latter at length prevailed, and the enemy retired; but the victory coſt them dear; ſince their veſſels, particularly thoſe of the Athenians, were reduced to a ſhattered condition; and their great inferiority in the number and ſize of their ſhips, made them feel more ſenſibly every diminution of ſtrength. This circumſtance determined them to retire to the ſhores of the Corinthian iſthmus. The inclination to this meaſure received

LEONIDAS.

London. Published as the Act directs. Sept.r 19 1807, by J. Wilkes.

received additional force from the arrival of Abronycus, with an account of the heroical death of Leonidas. The engagements by ſea and land had been fought on the ſame day. In both the Greeks defended a narrow paſs againſt a ſuperior power; and in both the Perſians had determined, by ſurrounding, to conquer them.

Before they left Artemiſium, Themiſtocles, watchful to promote the intereſt of his country, endeavoured to alienate from the great king the affections of his braveſt auxiliaries, namely, the Ionians. For this purpoſe he engraved on the rocks, near the watering-place of Artemiſium, the following words: "Men of Ionia, your conduct is moſt unjuſt in fighting againſt your anceſtors, and in attempting to enſlave Greece; reſolve, therefore, while it is yet in your power, to repair the injury. You ought to remember, that yourſelves gave occaſion to the quarrel between us and the barbarians; and farther, that the ſame duties which children owe to their parents, colonies owe to their mother-country."

When news arrived that the Grecian fleet had abandoned Artemiſium, Xerxes regarded their retreat as equal to a victory. He therefore iſſued orders that his naval force ſhould proceed to take poſſeſſion of the harbours of Athens; while, at the head of his numerous army, he reſolved to march into the Attic territory. Having entered the country of Phocis, the Perſian army ſeparated into two diviſions, with a view to obtain more plentiful ſupplies, as well as to deſtroy more completely the poſſeſſions of their enemies. The moſt numerous diviſion followed the courſe of the river Cephiſſus, which flows from the Theſſalian mountains to the lake Copais in Bœotia. The fertile banks of that river were adorned by Charadra, Neon, Elatæa, and other populous cities, all of which were burned or demoliſhed by the fury of Xerxes. After committing theſe dreadful ravages, one diviſion of the army marched into Bœotia; while the other ſtretched along the weſtern ſkirts of mount Parnaſſus, and traced a line of devaſtation from the banks of the Cephiſſus to the temple of Delphi. The Delphians conſulted the oracle, "Whether they ſhould hide their treaſures under ground, or tranſport them to ſome neighbouring country?" The Pythia replied, "That the arms of Apollo were ſufficient for the defence of his ſhrine." The Delphians, therefore, confined their attention only to the means of perſonal ſafety. The women and children were tranſported to Achaia; the men climbed to the craggy tops of mount Cirphis, or deſcended to the deep caverns of Parnaſſus. Only ſixty perſons, miniſters of Apollo, kept poſſeſſion of the ſacred city. But, could we credit the teſtimony of ancient hiſtorians, it ſoon appeared that the gods had not abandoned Delphi: ſcarcely had the Perſians reached the temple of Minerva the Provident, ſituated at a little diſtance from the town, when the air thickened, a violent ſtorm aroſe, the thunder and lightning were inceſſant. At length the tempeſt burſt on mount Parnaſſus, and ſeparated from its ſides two immenſe rocks, which rolling down with increaſed violence, overwhelmed the neareſt ranks of the Perſians. The ſhattered fragments, which long remained in the grove of Minerva, were regarded by the credulity of the Greeks as a ſtanding proof of the miracle. But without ſuppoſing any ſupernatural intervention, we may believe that an extraordinary event, happening on an extraordinary occaſion, would produce great terror and conſternation in the barbarian army, ſince many of the nations which compoſed it acknowledged the divinity of Apollo, and muſt therefore have been ſenſible of their intended impiety, in deſpoiling his temple. The awful ſolemnity of the place conſpired with the horrors of the tempeſt, and the guilty feelings of their own conſciences. An univerſal panic ſeized them; and they fled with terror and deſpair. The Delphians, who perceived their confuſion, and who believed that the gods, by the moſt manifeſt ſigns, defended their favourite abode, ruſhed impetuouſly from their faſtneſſes, and deſtroyed great numbers of the unreſiſting enemy. The remainder took the road of Bœotia, in order to join the diviſion under Xerxes, which having deſtroyed the cities of Theſpiæ and Platæa, was marching to inflict complete vengeance on the Athenians.

The united army arrived in the Attic territory three months after their paſſage over the Helleſpont. They laid waſte the country, burned the cities, and levelled the temples with the ground. At length they took poſſeſſion of the capital; but the inhabitants, by a retreat no leſs prudent than magnanimous, had withdrawn from the fury of their reſentment. The Athenians, by the advice of Themiſtocles, embraced a reſolution which eclipſed the glory of all their former exploits. They abandoned to the Perſian rage their villages, their territory, their walls, nay, Athens itſelf, with the revered tombs of their anceſtors; their wives and children, and aged parents, were tranſported to the iſles of Salamis and Ægina, and to the city of Træzonè. The embarkation was made with ſuch haſte, that the inhabitants were obliged to leave behind them their houſhold furniture, their ſtatues and pictures, and in general the moſt valuable part of their property. But they were willing to relinquiſh all for the ſake of their country, which they well knew conſiſted not in their houſes, lands, and effects, but in that equal conſtitution of government which they had received from their anceſtors, and which it was their determination to tranſmit unimpaired to poſterity.

The Athenians capable of bearing arms or of handling an oar, embarked on-board the fleet ſtationed at Salamis. The whole Grecian fleet amounted to three hundred and eighty veſſels. That of the Perſians, which now took poſſeſſion of the Athenian harbours lying to the ſouth of the ſtrait occupied by the Greeks, had alſo received a powerful reinforcement. We are not exactly informed of the number or ſtrength of the additional ſquadron; but it was ſuppoſed fully to compenſate the loſs occaſioned by ſtorms and ſea-fights, and to reſtore the Perſian fleet to its original complement of twelve hundred ſail.

Truſting to the immenſe ſuperiority of his armament, Xerxes was ſtill deſirous to make trial of his fortune at ſea, notwithſtanding his recent diſaſters on that element. But before he came to a final reſolution, he ſummoned a council of war, in order to hear the opinion of his maritime ſubjects and allies. The tributary kings of Tyre and Sidon, the leaders of the Egyptians, Cyprians, and Cilicians, ever ready to flatter the paſſions of their ſovereign, offered many frivolous reaſons in favour of the alternative to which they perceived him inclined. But in the fleet of Xerxes there was a Grecian queen named Artemiſia, widow of the prince of Halicarnaſſus, who had aſſumed the government of that territory for the benefit of her infant ſon. Compelled by the order of Xerxes, or perhaps irritated againſt the Athenians for ſome reaſons which hiſtory does not record, ſhe not only fitted out five ſhips to attend the Perſian expedition, but took upon herſelf the command of her little ſquadron, and on every occaſion conducted it with equal ſkill and bravery. Such vigour of mind, united with ſo delicate a form, excited the higheſt admiration; but the heroic ſpirit of Artemiſia becomes ſtill more intereſting, when we conſider the ſevere reſtraints which have been in all ages impoſed on the ſex. Her ſuperior genius recommended her to the favour of Xerxes, who was obliged to eſteem in a woman the virtues which he himſelf wanted ſpirit to practiſe. Truſting to his advantageous opinion of her courage and fidelity, Artemiſia diſſented from the general voice of the allies, and even oppoſed the inclination of the prince. Her judicious obſervations were however not heard; the moſt fatal opinion prevailed, becauſe it was adapted to flatter the vanity of Xerxes.

When the Grecian commanders obſerved that the enemy prepared to venture another engagement at ſea, they aſſembled to deliberate whether they ſhould continue in the ſtrait between Salamis and Attica, or proceed further up the gulf towards the Corinthian iſthmus. The latter propoſal was generally approved by the confederates of Peloponneſus, who anxiouſly deſired, in the preſent emergency, to approach as near as poſſible to their reſpective cities. But the experienced wiſdom of Mneſiphilus readily diſcerned, that ſhould the Greeks ſail from Salamis, it would be impoſſible to prevent the general diſperſion of their armament. He therefore exhorted Themiſtocles, to endeavour, by all means poſſible, to prevent this fatal meaſure; and particularly to perſuade the Spartan admiral, Euribiades, to alter his preſent intention. Themiſtocles readily embraced the opinion of his friend; and addreſſing himſelf to Euribiades, ſaid, "The fate of Greece depends on the deciſion of the preſent moment, and that deciſion on you; if you reſolve to ſail to the iſthmus, we muſt abandon Salamis, Megara, and Ægina; we ſhall be compelled to fight in an open ſea, where the enemy may fully avail themſelves of their ſuperior numbers; and, as the Perſian army will certainly attend the motions of their fleet, we ſhall draw their combined ſtrength towards the Grecian peninſula, our laſt and only retreat. But if you determine to retain the ſhips in their preſent ſtation, the Perſians will find it impoſſible, in a narrow channel, to attack us at once with their whole force: we ſhall preſerve Megara and Salamis, and we ſhall effectually defend Peloponneſus; for the barbarians being, as I firmly truſt, defeated in a naval engagement, will not penetrate further than Attica, but return home with diſgrace." The firmneſs of his ſpeech ſhook the reſolution of the confederates; and it was determined by the majority to continue at Salamis.

This reſolution was no ſooner formed, than a veſſel arriving from the iſthmus brought advice that the fortifications there were almoſt completed; if the fleet retired to the neighbouring ſhore, the ſailors might, even after a defeat at ſea, take refuge behind their walls; but if conquered near the coaſts of Salamis, they would be for ever ſeparated from their families and friends, and confined, without hope or reſource, within the narrow limits of a barren iſland. Leſt this information ſhould, as there was much reaſon to fear, again diſconcert his meaſures, Themiſtocles determined to prevent the Greeks from the poſſibility of acting upon it. There lived in his family a man named Sicinus, who at preſent accompanied him. He was originally a ſlave, and employed in the education of his children; but by the generoſity of his patron, had acquired the rank of citizen, with conſiderable riches. The firmneſs and fidelity of this man rendered him a proper inſtrument for executing a ſtratagem, which concealed, under the maſk of treachery, the enthuſiaſm of public virtue. Having received his inſtructions from Themiſtocles, he privately ſailed to the Perſian fleet, and obtaining admiſſion into the preſence of Xerxes, declared "That he had been ſent by the captain of the Athenians, who could no longer endure the inſolence of his countrymen, to acquaint the great king, that the Greeks, ſeized with conſternation at the near approach of danger, had determined to make their eſcape under cover of the night; that now it was the time for the Perſians to atchieve the moſt glorious of all their exploits, and, by intercepting the flight of their enemies, accompliſh their deſtruction at once." The deceit was believed; the whole day, and the greateſt part of the ſucceeding night, the Perſians employed in ſecuring the ſeveral paſſages between the iſlands and the adjacent coaſt.

The firſt intelligence of theſe operations was brought to the Grecian fleet by Ariſtides the Athenian, who ſeems not to have availed himſelf of the general act of indemnity to return from baniſhment, but who readily embraced every opportunity to ſerve his country. Having with difficulty eſcaped from the iſle of Ægina, the generous patriot immediately communicated an account of what he had ſeen there to his rival and enemy, Themiſtocles, who, meeting his generoſity with equal frankneſs, made him the confidant of his ſecret. Their interview was as memorable as the occaſion; and, after a continued life of oppoſition and hatred, they now firſt agreed to ſuſpend their private animoſities, in order to promote the common intereſt of their country. As the Peloponneſian commanders were either wavering and irreſolute, or had determined to ſet ſail, Ariſtides was deſired to inform them of the arrangement which he had ſeen; the conſideration of his country, however, rendered his evidence ſuſpected; but the arrival of a veſſel belonging to the iſle of Tenos confirmed his report, and the Peloponneſians reſolved to fight, becauſe it was impoſſible to fly.

Before the dawn of day the Grecian ſhips were drawn up in order of battle; and the Perſians, who had been ſurpriſed at not finding them attempt to eſcape during night, were ſtill more ſurpriſed when morning diſcovered their cloſe and regular arrangement. Themiſtocles delayed the attack until the ordinary breeze ſhould ſpring up, which was no leſs favourable to the experience of the Grecian mariners, than dangerous to the unwieldineſs of the Perſian ſhips. The ſignal was then given for the Athenian line to bear down againſt that of the Phœnicians, which rode on the weſt, off the coaſt of Eleuſis; while the Peloponneſians advanced againſt the enemy's left wing ſtationed on the eaſt, near the harbour of the Piræus. The Perſians, confiding in their number, and ſecure of victory, did not decline the fight. A Phœnician galley, of uncommon ſize and ſtrength, was diſtinguiſhed in the front of their line by every circumſtance of naval pomp. In the eagerneſs to engage, ſhe far outſtripped her companions; but her career was checked by an Athenian galley which ſailed forth to meet her. The firſt ſhock ſhattered her ſculptured prow, the ſecond buried her in the waves. The Athenians, encouraged by this auſpicious prelude, proceeded with their whole force, animating each other to the combat. The battle was bloody and deſtructive, and diſputed on the ſide of the Perſians with more obſtinate reſiſtance than on any former occaſion; for, from the Attic coaſt, ſeated on a lofty throne on the top of mount Ægialos, Xerxes obſerved the ſcene of action, and attentively remarked, with a view to reward and puniſh, the various behaviour of his ſubjects. The preſence of their prince operated on their hopes, and ſtill more powerfully on their fears. But neither the hope of acquiring the favour, nor the fear of incurring the diſpleaſure, of a deſpot, could furniſh principles of action worthy of being compared with the irreſiſtible bravery of the Greeks. The foremoſt ſhips of the Phœnicians were wholly diſperſed or ſunk. Such was the fate of the right wing; while the Ionians, who, on the left, oppoſed the fleets of Peloponneſus and Ægina, furniſhed them with an opportunity to complete the victory. Many of the Aſiatic Greeks, mindful of the advice given by Themiſtocles, abandoned the intereſt of the great king, and openly declared for their countrymen; others declined the engagement; the remainder were ſunk or put to flight. Among thoſe which eſcaped was the ſhip of queen Artemiſia, who in the battle of Salamis diſplayed ſuperior courage and conduct: ſhe was cloſely purſued by an Athenian galley, commanded by Amenias, brother of the poet Æſchylus. In this extremity, ſhe employed a ſucceſsful but very unwarrantable ſtratagem. The neareſt Perſian veſſel was commanded by Damaſithymus, a tributary prince of Calynda in Lycia, a man with whom Artemiſia was at variance. With great dexterity ſhe darted the beak of her galley againſt the Lycian veſſel. Damaſithymus was buried in the waves; and Amenias, deceived by this

ARISTIDES.

London, Published as the Act directs, Jan.y 31st 1807. by J. Wilkes.

this meaſure, believed the veſſel of Artemiſia to be one of thoſe which had deſerted the Perſian intereſt. The Phœnician and Ionian ſquadrons formed the main ſtrength of the Perſian armament; after theſe were defeated, the ſhips at a diſtance haſtily changing ſail, meaſured back their courſe to the neighbouring harbours. The victors, diſdaining to purſue them, dragged the moſt valuable part of the wreck to the coaſts of Pſyttalea and Salamis. The narrow ſeas were covered with the floating carcaſes of the dead, among whom were few Greeks, as even thoſe who loſt their ſhips in the engagement, ſaved their lives by ſwimming to others.

Xerxes had ſcarcely time to conſider and deplore the deſtruction of his fleet, when a new ſcene of diſtreſs offered itſelf to his view. The flower of the Perſian infantry had taken poſt on the rocky iſland of Pſyttalea, in order to receive the ſhattered remains of the Grecian armament, which, after its expected defeat, would naturally take refuge on that barren coaſt. But equally fallacious and fatal was their conjecture concerning the event of the battle. The Greeks, diſembarking from their ſhips, attacked in the enthuſiaſm of victory thoſe aſtoniſhed troops, who, unable to reſiſt, and finding it impoſſible to fly, were cut down to a man. As Xerxes beheld this dreadful havoc, he ſtarted in wild agitation from his ſilver throne, rent his royal robes, and commanded the main body of his forces, poſted along the Athenian coaſt, to return to their reſpective camps.

From that moment he reſolved to return with all poſſible expedition into Aſia. Yet did his fears and his policy conceal, for a few days, the deſign, not only from the Grecian but from the Perſian generals. Mardonius alone was too well acquainted with the temper of his maſter, to believe that his concern for the ſafety of his illuſtrious perſon would allow him to remain longer than neceſſary in a country which had been the ſcene of ſo many calamities. The artful courtier availed himſelf of the important ſecret, to divert the ſtorm of royal reſentment which threatened the principal author of this inglorious undertaking. In his firſt interview with Xerxes, he exhorted him "not to be too deeply affected by the defeat of his fleet: that he had come to fight againſt the Greeks, not with rafts of wood, but with ſoldiers and horſes: that the valour of the Perſians had oppoſed all reſiſtance, and their invincible ſovereign was now maſter of Athens, the main object of his ambition: that having accompliſhed the principal end of the enterpriſe, it was time for the great king to return from the fatigues of war to the cares of government; for with three hundred thouſand choſen men, he would undertake to proſecute his deſigns, and to complete his victory." Such is the language of adulation, too often held to princes. The other courtiers confirmed, by their approbation, the advice of Mardonius; and the Perſian monarch, while he obeyed the dictates of his own puſillanimity, ſeemed to leave Greece in reluctant compliance with the anxious ſolicitude of his ſubjects.

The remains of the Perſian fleet, frightened from the coaſts of Greece, returned to the harbours of Aſia Minor, and afterwards aſſembled and rendezvouſed, during the enſuing winter, in the port of Cymè. The tranſports were ordered to the Helleſpont, on the banks of which Xerxes arrived with his troops in forty-five days, after intolerable hardſhips and fatigue. Famine and peſtilence filled up the meaſure of their calamities; and, excepting the three hundred thouſand choſen men committed to Mardonius, a detachment of whom guarded the royal perſon to the coaſt, ſcarcely a remnant was left of ſo many millions. The bridge oſtentatiouſly erected on the Helleſpont would have preſented, had it remained entire, a mortifying monument of paſt greatneſs. But this wonderful fabric had been deſtroyed by a tempeſt: and ſuch is the obſcurity with which Xerxes returned from Greece, compared with the blaze of grandeur in which he arrived there, that it is uncertain whether he croſſed the channel in a Phœnician ſhip of war, or only in a fiſhing veſſel.

The victory at Salamis terminated the ſecond Perſian expedition. The Greeks ſoon underſtood that, notwithſtanding the return of Xerxes, three hundred thouſand men, commanded by Mardonius, were cantoned for the winter in Thrace, Macedon, and Theſſaly, with a deſign to take the field early in the ſpring, and again to try the fortune of war. His army conſiſted of the Medes, Perſians, Scythians, and Indians; and, though reduced from the millions which followed Xerxes to about three hundred thouſand men, it was thereby rather delivered from an uſeleſs incumbrance, than deprived of any real ſtrength. But, upon marching from Theſſaly, Mardonius determined to try the effect of negociation, before he had recourſe to arms. He therefore ſent Alexander king of Macedon, an Argive prince, to treat with the Athenians. The republic of Athens refuſed to call an aſſembly, until the Spartans ſhould ſend ambaſſadors to aſſiſt at the deliberation. When all parties were convened, Alexander opened his miſſion, and concluded a long ſpeech by aſking, "What madneſs, O Athenians, can impel you to maintain war againſt a monarch, whom you cannot expect *ever* to conquer, nor hope *always* to reſiſt?" He therefore exhorted them "to reflect on the advantages which would accrue to them from being alone, of all the Greeks, admitted into the alliance of Xerxes; to reflect alſo on the dreadful conſequences which would attend their refuſal, ſince their country, placed as a prize between the contending parties, would thereby be expoſed to inevitable deſtruction."

As ſoon as Alexander had ended his diſcourſe, the Spartan ambaſſadors repreſented to the aſſembly, "That they had been ſent on the part of their republic, to oppoſe the meaſures of the barbarians, with whom, in order to reſent the quarrel of her Athenian allies, Sparta had engaged in a bloody and deſtructive war. Could the Athenians then, for whoſe ſake alone the war which now extended over all Greece was originally undertaken, abandon their friends and confederates, whoſe ſervices they might command, and whoſe invincible army was ready to take the field?" The Athenians, after a ſhort deliberation, anſwered both parties by the voice of Ariſtides, who, as chief magiſtrate, preſided in the aſſembly. To the Macedonian he replied, "That as they were ſufficiently acquainted with the ſtrength of Xerxes, he might have ſpared them the inſult of deſcribing its vaſt ſuperiority to their own. Yet, in defence of liberty, there was no power too great to oppoſe. Return then, and tell Mardonius, that the Athenians will never make peace with Xerxes, while the ſun performs his annual courſe in the heavens; but that, truſting to the aſſiſtance of the gods and heroes, whoſe temples and images he has impiouſly deſtroyed, we will reſiſt him to the laſt extremity." To the Lacedæmonian ambaſſadors he ſaid, "Know, that the richeſt poſſeſſions on earth, and all the treaſures of the great king, are not ſufficient to ſeduce our unalterable attachment to Greece. We acknowledge with gratitude your proffered kindneſs; and requeſt that your army march with all poſſible expedition towards Bœotia, that our united reſiſtance may ſtop the progreſs of the barbarian, who, as ſoon as he is appriſed of our determined hoſtility, will not fail to proceed ſouthward, to invade Attica a ſecond time."

This conjecture was juſtified by the event. The Perſians within a few weeks marched into Bœotia, but the Athenians looked in vain for the expected arrival of their Spartan auxiliaries. Inſtead of iſſuing forth in order to ſupport their allies, they remained within the iſthmus, and endeavoured to fortify the inlet into their territory with ſuch additional walls and bulwarks as might render it impenetrable. The work was now complete; and the Peloponneſians, ſecure, as they imagined, behind this ſolid rampart, equally diſregarded

the ſafety, and deſpiſed the reſentment, of their northern allies.

The Athenians, a ſecond time forſaken by their confederates, were obliged again to deſert their country. They had ſcarcely ſailed to their families in Salamis, when Attica was again invaded by the Perſians. While the fugitives continued in that iſland, they received another embaſſy from Mardonius, offering them the ſame terms which they had formerly rejected. They ſtill perſiſted in rejecting them; in conſequence of which, they beheld, without apparent uneaſineſs, from the ſhores of Salamis, their territories again laid waſte; their cities and temples devoted to the flames; and every thing that had eſcaped the fury of the firſt invaſion, deſtroyed by the ſecond. After committing theſe ravages, Mardonius returned into Bœotia, that his troops might be ſupplied with proviſions, and that, ſhould the enemy offer battle, they might engage in a country better adapted than Attica to the operations of cavalry. Whether the eloquence of the ambaſſadors ſent by the Athenians to the Spartan ſenate on this diſtreſſing occaſion, or the returning ſenſe of public utility, overcame the puſillanimous reſolutions formerly embraced by the Spartans, is uncertain; but they now firſt determined to take the field. Five thouſand Spartan pike-men were accompanied by thirty-five thouſand helots. Their Peloponneſian allies ſent their reſpective contingents; ſo that the heavy-armed men raiſed in the peninſula exceeded twenty thouſand, commanded by Pauſanias, the guardian and kinſman of Pliſtarchus, ſon of Leonidas. Having marched beyond the iſthmus, they were joined by Ariſtides at the head of eight thouſand Athenians, and by a ſuperior number of their allies of Megara, Theſpiæ, Platæa, Salamis, Eubœa, and Ægina. The whole heavy-armed troops amounted to nearly forty thouſand; the light-armed were the thirty-five thouſand helots, attendants on the Spartans, and about as many more, one to each ſoldier, attended the other diviſions of the army.

Mardonius, having marched into Bœotia, encamped on the banks of the Æſopus. His army of three hundred thouſand men, while they waited the enemy's approach, were employed in building a ſquare fortification, about five quarters of a mile in front; a work of little utility, ſince it could only defend a ſmall portion of a camp which extended many miles, from the Theban town of Erythræa, to the territory of the Platæans. The Greeks, having arrived in thoſe parts, took poſt at the foot of mount Citheron, directly oppoſite to the enemy. The hoſtile armies remained eleven days in their encampments, facing each other. The Medes and Perſians encamped on the plain, fronting the Spartans: the Grecian auxiliaries were placed in direct oppoſition to the Athenians. It is eaſy to perceive, even at this diſtance of time, the reaſon of ſuch an arrangement. The Perſians avoided to encounter the Athenian bravery, which they had already fatally experienced in the field of Marathon; and as the Thebans were the moſt powerful of their foreign allies, as well as the inveterate enemies of Athens, it was thought proper to oppoſe them to that ſide on which the Athenians were poſted.

The ſame reaſons which made Mardonius deſire to preſerve, made the ſagacious Pauſanias wiſh to alter, the relative diſpoſition of their reſpective troops. Excepting in the glorious conteſt at Thermopylæ, in which they devoted themſelves to death for the ſafety of their country, the Spartans had never contended with the Medes; but they had often fought and conquered the Bœotians. Pauſanias therefore deſired the Athenians to change places with his countrymen. This requeſt was cheerfully complied with; but other circumſtances ſowed diſſenſion in the Athenian camp. The quiet likewiſe of the Lacedæmonians was diſturbed by the quarrels between Pauſanias and Anompharetus, the Spartan next in command; and conſpiring with theſe internal animoſities, the Perſian horſe beat up their quarters, intercepted their convoys, and, by an unexpected incurſion, deſtroyed their watering-place. It thus became neceſſary again to decamp. The obſcurity of midnight was choſen as the moſt convenient time for effecting this purpoſe; and the deſtined place of retreat was a narrow ſlip of ground lying towards the ſource of the Æſopus, and confined between that river and mount Citheron. This poſt was at leaſt preferred by the majority; for the Greeks were by no means unanimous; ſo that, when the march was ordered, many of the allies abandoned their leaders; others took refuge in the neighbouring temples, to elude the purſuit of the horſe; while Anompharetus the Spartan declared, "That neither he, nor the diviſion under his command, ſhould ever fly from the enemy:" and in conſequence of its diſperſion in ſo many different directions, the Grecian army preſented next morning the appearance, not of a regular march, but of a flight or rout.

Mardonius was firſt appriſed that the Greeks had changed their order of battle; and he was next informed that they had abandoned their camp. Not doubting that fear had precipitated their retreat, he ordered his ſoldiers to purſue the fugitives, and to complete the victory. The Lacedæmonians and Athenians were ſtill within his reach; the former near the foot of the mountain, the latter in the middle of the plain. Having ſent his Grecian auxiliaries, amounting to fifty thouſand, againſt the Athenians, he advanced with the braveſt of the Perſian troops againſt that portion of the enemy which had ſhewn an anxious ſolicitude to avoid his arms. Never did the contraſt appear greater, than in the oppoſite appearance and behaviour of the hoſtile armies on this occaſion. The barbarians, ill armed, and totally ignorant of diſcipline, advanced without order, and with a loud inſulting noiſe. The Lacedæmonians, carefully covered with their ſhields, patiently received the darts and javelins which the enemy threw upon them. But as ſoon as Pauſanias, caſting his eyes towards a neighbouring temple of Juno, and devoutly entreating the protection of the goddeſs, gave the ſignal to engage, the Spartans proceeded with intrepidity to cloſe with their opponents. The Perſians, reinforced by the Sacæ, a Scythian tribe, ſuſtained the attack with great bravery. Immenſe numbers were ſlain; but new numbers ſucceeded, crowding together in tumultuous diſorder, and making an hideous outcry, as if they had intended to tear in pieces and devour the enemy. Mardonius, mounted on a white ſteed of uncommon ſwiftneſs, was diſtinguiſhed in every part of the battle by the ſplendour of his appearance, but ſtill more by deeds of ſignal valour. He was attended by a thouſand horſemen, conſiſting of the flower of the Perſian nobility, all alike ambitious to imitate the example, and to emulate the fame, of their leader. Had their ſkill been equal to their courage, or had they previouſly beſtowed as much pains in diſciplining their troops, as in improving their own agility and addreſs, either the Greeks muſt have been conquered, or the battle remained doubtful. But the barbarians acted without union or concert; and as they fought ſingly, were ſucceſſively defeated. It is the nature, and the greateſt diſadvantage, of cavalry, not to increaſe in force in proportion to the reduplication of their ranks. The Grecian phalanx, on the other hand, received an acceſſion of ſtrength from every addition to its depth; the ranks behind ſupported thoſe before; no power was miſ-ſpent or unexerted: and the effect might be continually augmented, till it became irreſiſtible. Availing themſelves of this circumſtance, the Lacedæmonians thickened their ranks, extended their ſpears, ſuſtained the ſhock, and penetrated the depth, of the braveſt Perſian ſquadron. Mardonius fell by the arm of the Spartan Aieimneſtus. The death of the general was immediately followed by the defeat of the

the Perſians, and the defeat of the Perſians by the flight of the barbarian army. Artabazus, the Parthian chief, had from the beginning condemned the raſh meaſures of Mardonius. He commanded forty thouſand men, who were prepared on every occaſion to follow the example of their leader. As ſoon as he perceived the confuſion of the Perſians, he made the ſignal for his troops to quit the field. He conducted them through the territory of the Phocians, and arriving by haſty marches at the Helleſpont, returned in ſafety to the Aſiatic coaſt.

The remainder of the diſcomfited barbarians ſought refuge in their camp; and the Spartans purſued them with great ardour, but were unable to force their encampment. The Tegeans and other troops ſeconded the attack, but no impreſſion could be made on the wall, till the arrival of the Athenians. Theſe generous defenders of the cauſe of liberty had repulſed the Grecian auxiliaries, who ungenerouſly aſſiſted the enemies of their country. The behaviour of the greater part of the traitors furniſhed the occaſion of an eaſy victory; for, unable to meet the juſt reproaches and indignant looks of their countrymen, they ſoon betook themſelves to flight, which, in the preſent caſe, ſeemed more honourable than reſiſtance. The Thebans alone oppoſed with great perſeverance the Athenian valour; they did not deſiſt from hoſtility till ſeveral hundreds were ſlain; and when compelled to quit the field, they fled towards Bœotia, and ſhut themſelves up within the ſtrong walls of their city. Inſtead of purſuing theſe fugitives, though their domeſtic and inveterate foes, the Athenians, with a laudable moderation, inſpired by Ariſtides, directed their march towards the Lacedæmonian forces, which had already engaged and put to flight the main ſtrength of the enemy. The Athenians, however, came in time to complete the glory of that memorable day. They attacked with redoubled vigour the fortification, which had been in vain aſſailed by their allies; and having effected a breach in the wall, entered the Perſian camp. They were followed by the brave ſoldiers of Tegea, and afterwards by the Spartans. The barbarians were ſeized with conſternation at ſeeing ſo many myriads confined within a narrow ſpace. The means of their expected ſafety became the principal cauſe of their deſtruction; and of nearly two hundred thouſand barbarians, not two thouſand eſcaped the fury of the Grecian ſpear.

The event of this ſignal engagement not only delivered the Greeks from the danger of ſervitude, but gave them poſſeſſion of greater wealth than they could ever have expected to poſſeſs. In his precipitate retreat from Greece, Xerxes left behind him all his riches and magnificence. His moſt valuable effects were beſtowed on Mardonius, the flatterer of his inclinations, and the miniſter of his revenge. The reſt was divided among his inferior favourites; and independent of the bounty of the prince, the tents of the Perſian nobles furniſhed a wide profuſion of elegance and ſplendour. Couches magnificently embroidered; tables of gold and ſilver; bowls and goblets of gold; ſtalls and mangers of braſs, curiouſly wrought and ornamented; chains, bracelets, ſcymitars, of ſolid gold, others adorned with precious ſtones; and, to crown all, many cheſts of Perſian money, which began at that time, and continued long afterwards, to be current in Greece. Among the common maſs of ſpoil, Herodotus mentions many Perſian women, beſides innumerable horſes and camels. The whole being collected into one place, the tenth was conſecrated to the gods. A tenth of the remainder was beſtowed on Pauſanias, as commander in chief. Peculiar preſents were offered to the temples of Olympian Jove, Iſthmian Neptune, and Delphian Apollo, the favourite divinities of the whole Grecian name; nor did the Athenians forget to ſhew particular gratitude to the goddeſs Minerva. Prizes were afterwards diſtributed among the braveſt of the ſurviving warriors; for though the victory had been obtained with little blood, yet ſeveral hundreds had fallen, eſpecially of the moſt generous and daring; among whom were ninety-one Spartans, fifty-two Athenians, and ſixteen men of Tegea. Callicratides, a Spartan, the braveſt and moſt beautiful of the Greeks, was ſlain by an arrow, before Pauſanias had given the ſignal of engagement. As he fell, he ſaid to thoſe around him, that he was contented to die for Greece, but regretted dying inglorioufly, having performed nothing worthy of himſelf, or the common cauſe. But in the battle none of the warriors behaved with ſuch diſtinguiſhed bravery as Ariſtodemus, who alone, of three hundred Spartans, ſurvived the action of Thermopylæ. This circumſtance had rendered him contemptible in the eyes of his countrymen. He was continually upbraided with the baſe deſertion of his companions. The moſt heroic deeds could not reſtore him to the good opinion of the public; and it was aſſerted by the Spartans, that even on the preſent occaſion, as he had determined to ſeek a voluntary death in order to efface the ſtain of his former infamy, he was not entitled to any of thoſe honours which are deſervedly beſtowed on the genuine efforts of ſpontaneous valour.

The Greeks buried their dead with every circumſtance of funeral pomp, erected in the field of battle conſpicuous trophies of their renown, and appropriated about twenty thouſand pounds for dedicating temples and ſtatues to the tutelary deities of Platæa, the illuſtrious ſcene of victory. A few days were ſpent in theſe tranſactions; after which it was determined to march into Bœotia, in order to chaſtiſe the perfidy of the Thebans. On the eleventh day after the battle they arrived in the neighbourhood of Thebes, ravaged the territory, and made approaches to the walls. The citizens, who were not all equally guilty or equally obnoxious, eſcaped general deſtruction by ſurrendering the leaders of the faction which abetted the intereſt of the Medes. The traitors were carried to Corinth, condemned without trial, and ſacrificed to the manes of their countrymen who had fallen at Marathon, Salamis, and Platæa, in defence of political liberty and national independence.

The battle of Platæa was fought the 22d of September, in the year before Chriſt 479; and on the ſame day another battle, not leſs glorious or leſs deciſive, was fought between the ſame nations at the promontory of Mycalè in Ionia, oppoſite to the iſle of Samos. The ſhattered remnant of the Perſian fleet, which had eſcaped deſtruction on the fatal 20th of October of the preceding year, took refuge in the friendly ports of Aſia Minor. The victorious armament had ſuffered too much in repeated ſhocks with a ſuperior force, to engage at that late ſeaſon in the purſuit of an enemy, whoſe ſtrength, amounting to above four hundred veſſels, was ſtill nearly double to their own. The little ſquadron of Themiſtocles had been employed, after the battle of Salamis, in laying the iſlands of the Ægean Sea under contribution. The great body of the fleet rendezvouſed in the harbours of Ægina. There the Grecians continued during the winter, and before the ſeaſon for action approached, the command was beſtowed on Xantippus the Athenian, and Leotychides, the Spartan king. To theſe commanders, whoſe abilities and influence in their reſpective republics were conſiderable, there arrived early in the ſpring a ſecret deputation from ſeveral cities of Ionia, entreating that the valour of the European Greeks, which had been ſo ſucceſsfully employed in their own defence, might be ſtill farther exerted in delivering from bondage their brethren in Aſia. In conſequence of this invitation, the fleet ſailed eaſtward, and had ſcarcely reached the coaſt of Delos, when a ſecond embaſſy came from the Samians, propoſing the ſame meaſures as the firſt, and farther adding, that the Perſian fleet now lying in the harbour of Samos, might be attacked and defeated without danger or difficulty. The Grecians ſeized this favourable opportunity of terminating the war; but before they arrived at Samos, the enemy ſuſ-

pecting their motions, and unwilling to hazard another engagement, had retired to the Ionic coaſt, and, according to the cuſtom of that age, not only drawn their ſhips on-ſhore, but ſurrounded them with a ſtone wall of conſiderable ſtrength. The veſſels thus ſecured, the ſailors, amounting to forty thouſand, commanded by Artayndes, formed a camp along the ſhore. They were reinforced by the Perſian army under Tigranes, computed at ſixty thouſand; and, though they had acknowledged their inferiority at ſea, they determined on land to hazard a general engagement. The Greeks did not decline the battle; and Leotychides, in order to encourage his troops, is ſaid to have induſtriouſly ſpread a report that their countrymen had obtained a ſignal victory at Platæa. This report, by whatever means it was raiſed, had doubtleſs a conſiderable effect in deciding the fortune of the day. Other circumſtances, not leſs powerful, were, the general revolt of the Aſiatic Greeks, and the ſilent conteſt of honour between the Spartans and Athenians. Among the barbarian troops, the Perſians behaved with uncommon bravery; and on the ſide of the Grecians, the battle of Mycalè was more bloody than any other fought in the courſe of the war. It deſerves notice, that in all theſe memorable actions, the Greeks had no reſource but in victory. But the barbarians had provided probable means of ſafety, even in caſe of a defeat. On the preſent occaſion they had endeavoured not only to ſecure a retreat within a ſtrongly fortified camp, but to acquire an undiſturbed paſſage through the narrow defiles of Mycalè. Yet all their precautions were rendered ineffectual by the valour and fortune of the Greeks. The Mileſians, poſted by the enemy to guard the paſſes of the mountain, inſtead of promoting, prevented their eſcape. The Spartans purſued them with great ſlaughter in that direction; while the Athenians, aſſiſted by the allies of Corinth, Sicyon, and Træzenè, advanced with undaunted bravery to attack their camp. The Aſiatic Greeks, who at all times acknowledged the warlike pre-eminence of their European brethren, emulated, in the preſent engagement alone, the admired valour of their anceſtors. Above forty thouſand Perſians periſhed in the field; many fell in the purſuit, or in defending their entrenchments: the remainder fled in diſorder, nor thought themſelves ſecure till they had reached the walls of Sardis. Their ſhips, their camp, the freedom of Ionia, and the undiſturbed poſſeſſion of the Aſiatic coaſt, formed the ineſtimable prize of the victors; and thus the expedition of Xerxes, undertaken with a view to enſlave Europe, reſtored liberty to the faireſt portion of Aſia.

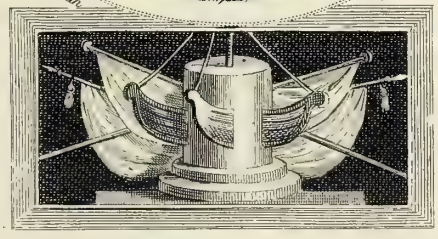
From the final overthrow of the Persian invasion, to the peace of Nicias.

After the deciſive victories of Platæa and Mycalè, it was the firſt care of the Athenians to bring home their wives, children, and moſt valuable effects, from the iſles of Ægina and Salamis. In the latter iſland they celebrated that important day, which proved alike glorious to Greece, and fatal to Perſia. But an attention to domeſtic concerns prevented not the Athenians from puſhing the war with vigour, though deſerted by the Spartans and other Peloponneſians, who ſailed home before winter. The Aſiatic colonies, animated by the recent recovery of freedom, ſeconded the Athenian ardour; and the confederates, having ſucceſsfully infeſted the territories of the great king, beſieged and took the rich city of Seſtos in the Cherſoneſus of Thrace, the only place of ſtrength which adhered to the Perſian intereſt in the fertile peninſula.

During the two following years the war languiſhed abroad, while the ſymptoms of jealouſy and diſcord broke out at home. The Athenians began the laborious taſk of rebuilding their city, which the Perſian ſpoils might contribute to enrich with uncommon magnificence, and which the acquaintance gained in the courſe of the war with the graceful forms of Ionic and Doric architecture might enable them to adorn with more beauty and elegance than had yet been diſplayed in Europe. But the weighty advice of Themiſtocles prevailed on them to ſuſpend this noble undertaking, and engaged them, inſtead of decorating their capital with temples, theatres, and gymnaſia, to fortify it by walls of ſuch ſtrength and ſolidity as might thenceforth bid defiance to every enemy, whether foreign or domeſtic. The meaſure was ſcarcely determined upon, when an embaſſy arrived from Sparta, remonſtrating againſt a deſign peculiarly dangerous to thoſe who owed their ſafety to the weakneſs of their cities. Themiſtocles eaſily unveiled the ſuſpicion concealed under this ſpecious maſk of public utility, and encouraged his countrymen to elude the Spartan artifice by ſimilar addreſs; in conſequence of which, Themiſtocles was immediately diſpatched to Sparta, to explain their intentions. Meanwhile the Athenian walls roſe up with unexampled celerity; nor did even the ſilent tranquillity of night abate the ardour of their diligence. The Athenian ambaſſadors artfully deferred opening their commiſſion till they had news from Athens that the walls were completed: they then appeared in the Lacedæmonian aſſembly; and Themiſtocles, ſpeaking for the reſt, declared, that his countrymen needed not to learn from their confederates, what meaſures were honourable to themſelves, and beneficial to the common cauſe; that, by his advice, they had firmly defended their city againſt the aſſaults of open enemies and jealous friends. Whatever ſecret indignation this ſpeech might excite, the Spartans thought proper to ſuppreſs their animoſity. Themiſtocles returned in peace to Athens, and ſet on foot the projection of that arduous work, the formation of the Piræus or harbour. The new walls were ſufficiently broad to admit two carriages abreaſt; the ſtones compoſing them were of an immenſe ſize, ſtrongly united by bars of iron. The Piræus, which was five miles diſtant from the citadel, ſoon grew into a town, containing many thouſand inhabitants. It was joined to the city by walls begun by Cimon, but finiſhed by Pericles, twenty years after the harbour itſelf had been erected. The new buildings of Cimon and Pericles are often mentioned in hiſtory under the name of the Long Walls. They extended forty ſtadia on either ſide; and, when added to the circumference of the ancient city, (about ſixty ſtadia,) give us for the whole circuit of the Athenian fortifications an extent of nearly eighteen Engliſh miles.

The altercations excited by theſe undertakings at home, prevented not their united arms from aſſaulting the dominions of the great king. Thirty Athenian and fifty Peloponneſian ſhips had been employed to expel the Perſian garriſons from the ſea-ports which they ſtill occupied in the Helleſpont, the Propontis, and the Ægean, iſles. The European fleet, being ſeaſonably joined by various ſquadrons from the Greek cities of Aſia, ſcoured the eaſtern ſhores of the Mediterranean, and delivered from oppreſſion in the year before Chriſt 476, the long enſlaved iſland of Cyprus. Their next operation was the ſiege of Byzantium, the modern Conſtantinople, firſt founded by a feeble colony of Megareans, which had gradually become populous and flouriſhing, but ſubject to Xerxes. The place was well ſupplied with proviſions, and commanded by Perſians of the firſt diſtinction, among whom were ſeveral kinſmen of the great king. The ſiege was obſtinate and bloody; the walls were ſtormed, and an immenſe booty, together with many Perſian princes and nobles, fell into the hands of the victors. And here ends the glory of Pauſanias, who ſtill commanded the forces of the confederacy; a man whoſe fame would rival the moſt illuſtrious names of antiquity, had he fallen in the ſiege of Byzantium. But grown too great to remain a ſubject, he was emulous to become a ſovereign, through the aſſiſtance of Xerxes, the inveterate enemy of his country.

To



THEMISTOCLES.

London. Published as the Act directs. August 15th 1807, by J. Wilkes.

To this prince he propoſed to enter into ſtrict friendſhip, to take his daughter in marriage, to ſecond his efforts in conquering Greece, and to hold that country as a dependent province of the Perſian empire. The Perſian king highly reliſhed theſe propoſals, the ſubjugation of Greece being the great object of his reign. He ſpeedily ſent Artabazus, a nobleman of confidence, to confer and co-operate with the traitor. But the treachery being timely diſcovered, Pauſanias took refuge in the temple of Minerva, from which it being unlawful to drag him, that aſylum was ſurrounded by guards, and all neceſſaries were denied the priſoner, and he thus periſhed by hunger.

The puniſhment of Pauſanias could but ill repair the ruinous effects of his miſconduct. All the confederates now loudly rejected the Spartan chiefs appointed to command them. They unanimouſly applied to Ariſtides, to whoſe approved wiſdom and virtue they not only entruſted the operations of the combined armament, but voluntarily ſubmitted their more particular concerns; and experience ſoon juſtified their prudent choice. While the merit of Ariſtides thus procured his countrymen the management of the national treaſury of Greece, Themiſtocles was equally ſucceſsful in improving the internal reſources of the ſtate. By yielding more protection to ſtrangers than they enjoyed in neighbouring cities, he augmented not only the populouſneſs, but the wealth of Athens, as that deſcription of men paid an annual contribution in return for their ſecurity. This, together with other branches of the revenue, he employed in building annually about ſixty gallies, the addition of which to the Athenian navy abundantly compenſated ſuch loſſes as were ſuſtained by the accidents of the ſea in foreign parts. Themiſtocles was faſt advancing to the attainment of the ſame authority at home, which Ariſtides enjoyed abroad, when a charge arrived from Sparta, that he had conſpired with Pauſanias to betray the public liberty. The known reſentment of the Spartans againſt this extraordinary man, ſufficiently explains the reaſon of their conduct. But it is not eaſy to conceive, how the Athenians could admit ſuch an accuſation againſt a citizen, whoſe ſingular valour and conduct had gained the deciſive victory at Salamis; whoſe counſels and addreſs had fortified their city with impregnable ſtrength; whoſe foreſight and activity had procured them a fleet which no nation in the world could reſiſt; and whoſe abilities and patriotiſm had not only ſaved his country from the moſt formidable invaſion recorded in hiſtory, but amidſt the terrors of this invaſion, the treachery of falſe friends, and the violence of open enemies, had ſo eminently contributed to raiſe his republic to the firſt rank in the Grecian confederacy. Yet ſuch, on the one hand, was the effect of that envy which, in republics, always accompanies excellence; and ſuch, on the other, the influence of Spartan bribery and intrigues, that Themiſtocles was firſt baniſhed, and afterwards condemned to ſuffer death. He eſcaped into Perſia, where his wonderful verſatility of genius, in acquiring the language and manners of that country, recommended him to the new king Artaxerxes Longimanus, who had lately ſucceeded the unſucceſsful invader of Greece. The ſuſpicion of treaſon throws a dark ſhade on the eminent luſtre of his abilities; nor does the diſintereſtedneſs of his private character tend to remove the imputation. A report prevailed in Greece, that Themiſtocles could never forgive the ingratitude of the Athenians, which he had determined to revenge at the head of a powerful army, raiſed by Artaxerxes. But deſpairing of being able to accompliſh his deſign, he ended his life by poiſon at the age of ſixty-five, in Magneſia, a town of Lydia, which had been beſtowed on him by the liberality of the Perſian monarch.

It is worthy of obſervation, that the three great commanders who had ſo nobly reſiſted the arms of Xerxes, quitted the ſcene almoſt at the ſame time, namely, in the year before Chriſt 472. While Pauſanias and Themiſtocles ſuffered the puniſhment of their real or pretended crimes, Ariſtides died of old age, univerſally regretted by the affectionate patriots of his country. He, who had long managed the treaſury of Greece, left not a ſufficient ſum to defray the expence of his funeral. His ſon Lyſimachus received a preſent of three hundred pounds from the public, to enable him to purſue and finiſh his education. His daughters were maintained and portioned at the expence of the government. This honourable poverty well correſponded with the manly elevation of his character, whoſe pure and unſullied ſplendour far eclipſes the doubtful fame of his heroic but unfortunate rival.

By the death of Ariſtides, the conduct of the Perſian war devolved on his colleague Cimon, who united the integrity of that great man to the valour of Miltiades and the boldneſs of Themiſtocles. His firſt operations were employed againſt the coaſt of Thrace. Amphipolis was ſoon taken, and ſecured by a garriſon of Athenians. But Eion ſtill oppoſed a vigorous reſiſtance; Boges, the Perſian governor, having determined rather to periſh than ſurrender. After long baffling the efforts of the beſiegers, this fierce barbarian was at length exaſperated by hunger. His companions and attendants, equally deſperate with their leader, followed his intrepid example; and mounting the ramparts with one accord, threw into the middle ſtream of the Strymon their gold, ſilver, and other precious effects. After thus atteſting their implacable hatred to the aſſailants, they calmly deſcended, lighted a funeral pile, butchered their wives and children, and again mounting the walls, precipitated themſelves headlong into the thickeſt of the flames. And with this ſignal act of deſpair ended the Perſian dominion over the coaſt of Europe, which finally ſubmitted to the victorious arms of Cimon.

After receiving conſiderable reinforcements, added to a fleet of three hundred ſail, Cimon ſtretched towards the coaſt of Caria, where his approach ſerved for the ſignal of liberty to the numerous Greek cities in that valuable province. The victorious armament then proceeded eaſtward to Lycia, and received the ſubmiſſion of that extenſive coaſt. The citizens of Phaſelis alone, defended by ſtrong walls, refuſed to admit the Grecian fleet, or to betray their Perſian maſter. Their reſiſtance was ſpirited and formidable; but the perſeverance of Cimon finally overcame all obſtacles, and obliged them to ſurrender.

Artaxerxes, having re-eſtabliſhed the Perſian authority in the iſle of Cyprus, conſidered that Pamphylia, being the next province to Lycia, would probably receive an early viſit from the victorious Greeks. That he might meet them with becoming vigour, he aſſembled a powerful army on the banks of the Eurymedon; a fleet likewiſe, of four hundred ſail, was collected, and ordered to rendezvous near the mouth of that river. The Greeks, conducted by the activity of Cimon, delayed not to undertake the enterpriſe which the prudence of Artaxerxes had foreſeen. Their fleet, amounting to two hundred and fifty gallies, fell in with the Perſian ſquadrons off the coaſt of Cyprus. The barbarians, confident in their ſuperior numbers, did not decline the engagement, which was obſtinate, fierce, and bloody. Many of their ſhips were ſunk; an hundred were taken; the reſt fled in diſorder towards the ſhore of Cyprus; but, being ſpeedily purſued, they were abandoned by the terror of their crews, to the victors; and thus the mighty fleet of ſhips, which the great king had raiſed with ſuch flattering hopes, were added in one day to the navy of Greece.

The captured veſſels contained above twenty thouſand Perſians. The ſoldiers encamped on the Eurymedon were ſtill ignorant of the battle. Theſe circumſtances inſtantly ſuggeſted to the quick diſcernment of Cimon a ſtratagem for ſurpriſing the Perſian camp, which

was

was executed in the evening of the same glorious day. The prisoners were stripped of their eastern attire; the bravest of the Greeks condescended to assume the tiara and scymitar, and thus disguised, embarked in the Persian ships, and sailed up the Eurymedon with a favourable gale. The unsuspecting barbarians received them with open arms into their camp, as their long-expected companions. But the Greeks had no sooner been admitted within the gates, than at once drawing their swords, they attacked, with disciplined valour, the defenceless security of their astonished adversaries. Before the Persians recovered from their surprise, Cimon had advanced to the tent of their general. Consternation and despair seized this numerous host. The few who were least overcome by the impressions of fear and amazement, betook themselves to flight; a panic suspended the powers of the rest; they fell, unarmed and unresisting, by the hands of an unknown enemy. The rich spoils of the camp rewarded the enterprise and celerity of the Greeks, who, loaded with wealth and glory, returned home during winter, and piously dedicated to Apollo a tenth of the plunder acquired by these memorable atchievements.

After these decisive victories, the Greeks, headed by the Athenians, carried on the war during twenty-one years, rather for plunder than glory. The manifest superiority which they enjoyed on all the eastern shores of the Mediterranean, might have rendered their maritime allies sufficiently secure. But the people of Athens, whose councils were now governed by the magnanimous ambition of Pericles, had the address to persuade their confederates that naval preparations and enterprises were still as necessary as ever. At length, however, most of those scattered islands which followed the fortune of Athens, grew weary of perpetual hostilities, of which they shared the toil and the danger, while their ambitious leaders alone reaped the advantage and the glory. The Athenians availed themselves of this disposition, to engage such states as appeared most backward in raising their contingents, to compound for personal service on shipboard, by an annual supply of money, which might enable Athens continually to keep in readiness a fleet of observation, to watch and check the motions of the common enemy. This contribution soon amounted to about an hundred thousand pounds. It was gradually augmented; and, at length, raised by Pericles to three times the original sum; an immense income, considering that the proportional value of money to labour was then ten times higher than at present; and considering also the very limited revenues of the greatest monarchs of antiquity; since, from all the various provinces of the Persian empire, scarcely four millions sterling entered the royal treasury!

In the year before Christ 450, the Athenians set on foot an expedition against the island of Cyprus, which had become subservient to the Persians. A fleet of two hundred sail was entrusted to Cimon, who enjoyed a prosperous voyage to the Cyprian coast. The towns of Malos and Citium opposed a feeble resistance, and the singular humanity with which Cimon treated his prisoners, would have facilitated more important conquests: but the Phœnician and Cilician fleets had again put to sea, and Cimon wisely determined to attack them as they approached the island, rather than wait their arrival, his countrymen being superior to their enemies, still more in naval than in military prowess. In the battle which followed, he took above a hundred gallies; the number of those sunk or destroyed is unknown; the remainder fled to the coast of Cilicia, in hopes of protection from the army of the Persian general Megabazus, encamped in that province; but that unwieldy body was unable to afford them any effectual relief. The Greeks, having pursued them on shore, totally destroyed them, as well as the Persian detachments who came to their succour, and returned loaded with spoil to Cyprus.

The Athenian general then prepared to form the siege of Salamis, which, though defended by a numerous Persian garrison, and well provided with all the necessaries of defence, must have soon yielded to his skill and valour, had not sickness, in consequence of a wound received before the walls of Citium, prevented him from exerting his usual vigour.

Meanwhile Artaxerxes, who perceived that the acquisition of Salamis would naturally draw after it the conquest of the whole island, and who had been continually disappointed in expecting to prepare fleets and armies able to contend with the Athenians, eagerly solicited for peace. His ambassadors were favourably heard in the Athenian assembly, and a peace was concluded on the following conditions: That all the Greek colonies in Lower Asia should be declared independent of the Persian empire; that the armies of the great king should not approach within three days' journey of the western coast; and that no Persian vessel should appear between the Cyanean rocks and the Chelidonian isles, that is, in the wide extent of the Ægean and Mediterranean seas, between the northern extremity of the Thracian Bosphorus and the southern promontory of Lycia. On such terms the Athenians and their allies stipulated to withdraw their armament from Cyprus, and to abstain thenceforward from molesting the territories of the Persian king. Such was the conclusion of this memorable war, which, since the burning of Sardis, the first decisive act of hostility, had been carried on, with little intermission, during fifty-one years. The same magnanimous republic, which first ventured to oppose the pretensions of Persia, dictated to that haughty empire the most humiliating conditions of peace; an important and illustrious era in Grecian history, which was often celebrated with pompous panegyric during the declining ages of Athenian glory. But from this era the Athenian laurels began to fade; internal discord and mutual jealousy burst forth into a raging flame, and laid the foundation of the long and sanguinary Peloponnesian war.

The powerful cities of Sparta, Thebes, and Argos, could not behold, without dissatisfaction and anxiety, the rapid growth of a republic which already eclipsed their splendour, and might eventually endanger their safety. The Spartans therefore determined to make war on the Athenians, expecting to be seconded by the fears of the weak, and the jealousy of the more powerful, states, on both sides the Corinthian isthmus. But their animosity, before it broke out into open action, was diverted by a calamity equally sudden and unforeseen. In the year 469 before Christ, Sparta was overwhelmed by an earthquake. Taygetus and the neighbouring mountains were shaken to the foundation, and twenty thousand Lacedæmonian citizens perished in this dreadful catastrophe. But, amidst the ruins of Sparta, one description of men beheld the public misfortunes not only without horror, but with a secret satisfaction. The oppressed Spartan slaves, known by the appellations of Helots and Messenians, assembled in crowds from the villages in which they were cantoned, and took measures for delivering themselves, during the cruelty of the elements, from the inexorable cruelty of their unfeeling tyrants. The prudent dispositions of king Archidamus, who foreseeing the revolt, had summoned the citizens to arms, prevented them from getting immediate possession of the capital; but they rendered themselves masters of the strong fortress of Ithomè, from which they continued many years to infest the Lacedæmonian territories. The Spartans, in vain exerted their utmost endeavours to expel this dangerous enemy; and in the third year of the war (for this revolt is dignified in history by the name of the Third Messenian War), they had recourse to the Athenians, who, of all the Greeks, were deemed the most skilful in sieges. The Athenians, either not sufficiently acquainted with the secret hostility of Sparta, or willing to dissemble their knowledge

of it, ſent them the required aſſiſtance. The beſiegers, however, met with ſo little ſucceſs, that the Spartans diſmiſſed their Athenian auxiliaries, on pretence indeed that their help was no longer neceſſary; but, in reality, from a ſuſpicion that they favoured the intereſt of the rebels; and, as they retained the troops of all the other allies, the Athenians were juſtly provoked by this inſtance of diſtruſt. Meanwhile the inhabitants of Piſa gave vigorous aſſiſtance to the beſieged. The place thus held out for ten years; and both parties muſt have been reduced to extremity, ſince the Helots and Meſſenians, though obliged to ſurrender, obtained from the weakneſs, a condition which they would have vainly ſolicited from the mercy, of Sparta, "that they ſhould be allowed, with their wives, children, and effects, to depart, unmoleſted, from the Peloponneſus." The Athenians, deeply reſenting the affront of ſuſpected fidelity, determined to mortify the Spartans by kindly receiving the fugitives, whom, in the year before Chriſt 459, they finally eſtabliſhed in Naupactus, a ſea-port on the Criſſean gulph. The Helots and Meſſenians repaid, by ſignal gratitude, the humane protection of Athens. During the long courſe of the Peloponneſian war, while their neighbours on every ſide eſpouſed the oppoſite intereſt, the inhabitants of Naupactus alone invariably exerted themſelves in defence of the declining power of their magnanimous benefactors.

While the earthquake and the ſervile war confined within a domeſtic ſphere the activity of Sparta, Argos, the ſecond republic of the Peloponneſus, underwent ſuch revolutions and misfortunes, as left her neither inclination nor power to oppoſe the Athenian greatneſs. Ever rivals and enemies of Sparta, the Argives had jealouſly declined the danger and glory of the Perſian war, to the ſucceſs of which their adverſaries had ſo eminently contributed. This ungenerous dereliction paſſed not unpuniſhed. As deſerters of the common cauſe, the Argives incurred the hatred and contempt of their public-ſpirited neighbours. Mycenæ, once the proud reſidence of the royal Agamemnon, with Epidaurus, and Træzenè, which formed reſpectively the greateſt ſtrength and ornament of the Argive territory, threw off the yoke of Argos, whoſe folly or baſeneſs rendered her unworthy to govern them. Sicyon, Nauplia, Heliæa, and other towns of leſs note, followed their example, and aſſumed independence. The rebels, (for as ſuch they were treated by the magiſtrates of Argos,) ſtrengthened themſelves by foreign alliance, and continued thenceforth to diſdain the authority of their ancient metropolis and ſovereign. At the commencement of the Peloponneſian war, they formed a reſpectable portion of the Lacedæmonian confederacy; while Argos alone, of all the cities in the Peloponneſus, ſupported the cauſe of the Athenians. The ancient city of Mycenæ, which had firſt ſounded the trumpet of ſedition, was the only victim of Argive reſentment. The men of Argos ſeized a favourable opportunity, while the allies of Mycenæ were occupied with their domeſtic concerns, to lead their whole forces againſt the place; and having taken it by ſtorm, they decimated the inhabitants, and demoliſhed not only the walls, but the town itſelf, which was never afterwards rebuilt.

The ſame cauſes which humbled the pride of Argos, operated alike fatally on Thebes, the ſecond republic beyond the iſthmus, and the only one that ever aſpired to rival the power of Athens. The Thebans, for ſimilar reaſons with thoſe which had reſtrained the Argives, had alſo withheld their aſſiſtance in the Perſian war; and by this mean ſelfiſhneſs had juſtly provoked the indignation of the cities of Bœotia. Not only Theſpiæ and Platæa, which had ever borne with impatience the Theban yoke, but the ſea-ports of Aulis, Anthemon, Larymna, and ſeveral other cities, rejected the ſovereignty of Thebes, which, during the invaſion of Xerxes, had ſo ſhamefully betrayed the common intereſt and glory of the nation. During ſeveral years, the Thebans patiently yielded to a ſtorm which they found it impoſſible to reſiſt. But when the Spartans began to recover from their recent diſtreſs, the Thebans warmly ſolicited them to take part in their quarrels, and enable them to regain their aſcendant in Bœotia; with aſſurance that they would employ the firſt moments of returning vigour to oppoſe the growing power of the Athenians. This propoſal was accepted, not only by the reſentment but by the policy of the Spartan ſenate, who perceived it to be their intereſt that Thebes, the neighbour and rival of Athens, ſhould recover her authority in Bœotia. They were applying themſelves with vigour and ſucceſs to effect this ſalutary purpoſe, when the active vigilance of Athens diſpatched an army, fifteen thouſand ſtrong, to maintain the independence of Bœotia. The valour and conduct of Myronides, the Athenian general, obtained a deciſive victory near the walls of Tanagra, one of the few places in the province which had preſerved its fidelity to the capital. This memorable battle, which no ancient writer has thought proper to deſcribe, although it is compared to the glorious trophies of Marathon and Platæa, confirmed the liberty of Bœotia; nor could the Thebans, notwithſtanding their partial ſucceſs againſt ſeveral of the revolted cities, recover their authority in that province until about fourſcore years afterwards, when they emerged into ſudden ſplendour under the conduct of their heroic Epaminondas.

The ambitious policy of Pericles was always ready to profit by every favourable turn of fortune. He took care to place Athenian garriſons in ſeveral Bœotian fortreſſes; he made the neighbouring republics of Corinth and Megara feel and acknowledge the ſuperiority of Athens; and after ſending Tolmidas, a commander endued rather with an impetuous than a well-regulated courage, to ravage the coaſt of the Peloponneſus, he ſailed thither in perſon, and made the Lacedæmonians and their allies deeply regret, that they had too ſoon diſcovered their animoſity againſt a republic, ſo capable of taking vengeance on its enemies. The meaſures of this daring leader were actually uncontrouled by any oppoſition, ſince his eloquence had prevailed over the innocence and merit of Cimon, and procured the baniſhment of that illuſtrious commander. But Cimon was recalled in two years; and his return was ſignaliſed by a ſuſpenſion of arms in Greece, which that real patriot had been as zealous to promote, as he was ambitious to purſue his Aſiatic triumphs. This treaty, however, was ſoon broke; but an ill-concerted and unfortunate enterpriſe againſt Thebes, in which the raſh Tolmidas loſt his army and his life, made the Athenians again liſten to terms of accommodation. They agreed to withdraw their garriſons from Bœotia; to diſavow all pretenſions againſt Corinth and Megara, and, on complying with theſe conditions, the Athenians recovered their citizens made priſoners in Bœotia through the miſconduct of Tolmidas.

This was the famous truce of thirty years concluded in the fourteenth year preceding the Peloponneſian war. The former treaty had been limited to a much ſhorter period; for it is worthy of obſervation, that even in their agreements of peace, the Greeks diſcovered that perpetual propenſity to war, which was the unhappy effect of their political inſtitutions. The terms of this accommodation, ſeemingly little favourable to the intereſt of Athens, were nevertheleſs dictated rather by the ambition than the equity of that republic; a concluſion that evidently reſults from examining the ſeries of events which completes the hiſtory of this memorable period. Amidſt the foreign expeditions of Cimon, and the domeſtic diſſenſions of Greece, the Athenian arms and policy had been gradually, during thirty years, eſtabliſhing the ſovereignty of the republic over her diſtant colonies and confederates. This bold undertaking was finally accompliſhed by Pericles, whoſe character con-

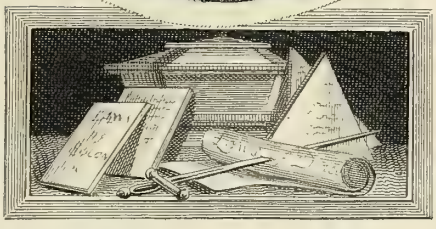
tributed, more than that of any one man, to the glory and greatneſs, as well as to the calamities and ruin, of his country. His father Xanthippus, who gained the illuſtrious victory at Mycalè, rejoiced in a ſon endued with the happieſt talents, and an innate love of glory; and who early learned to controul the tempeſt of youthful paſſions, which ſo often blaſt the promiſing hopes of manhood. Thus qualified by nature and education, he ſoon diſplayed, in the Athenian aſſembly, an eloquence nouriſhed by the copious ſpring of philoſophy, and ennobled by the manly elevation of his character. But the ſuperior talents of Pericles, which, in a well-regulated government, would have increaſed his influence, had well nigh occaſioned his ruin in a turbulent and ſuſpicious democracy. The alarmed jealouſy of the envious contrived a faction againſt the imagined tyranny of Pericles; who, to eſcape the diſgrace of the oſtraciſm, ſhunned the further admiration of the aſſembly.

The active vigour of his mind, thus withdrawn from politics, was totally directed to war; and his abilities, alike fitted to excel in every honourable purſuit, and gradually opening with every occaſion to diſplay them, carried off the palm of military renown from the moſt illuſtrious captains of the age. Under his influence, as noticed above, many of the maritime ſtates had conſented to pay an annual ſubſidy, inſtead of finding men and ſhips. But theſe communities had unwarily forged their own chains, when they conſented to raiſe an annual tax to maintain the guardian navy of Athens. They perceived not, that this temporary aid would ſoon be converted into a perpetual tribute, ſince, in proportion as they became unaccuſtomed to war, they laid themſelves at the mercy of that republic to which they had tamely entruſted the care of their defence. When the rigorous exactions of Athens ſpeedily warned them of their error, the wide intervals at which they were ſeparated from each other rendered it impoſſible for them to afford mutual aſſiſtance, or to act with united vigour. Naxos, Thaſos, Ægina, Eubœa, Samos, and other iſlands and cities of leſs importance, boldly ſtruggled to repel the uſurpation; but, each fighting ſingly, were ſucceſſively ſubdued; while new, and more grievous, burdens were cruelly impoſed on them. The leaſt patient again murmured, petitioned, rebelled, and taking arms to reſiſt oppreſſion, were treated with the ſeverity due to unprovoked ſedition. The puniſhment inflicted on them was uniformly rigorous. They were compelled to deliver up the authors of the revolt, to ſurrender their ſhipping, to demoliſh their walls, or receive an Athenian garriſon, and to pay the whole expences of the *ſocial* or thirty years' war, by which names it is known in hiſtory, and which was finiſhed by Pericles with every ſucceſs the moſt preſumptuous ambition of Athens could either expect or deſire. Samos, the capital of the iſland of that name, made the moſt vigorous reſiſtance; but at length ſurrendered to Pericles, after a ſiege of nine months, in the ninth year before the war of Peloponneſus.

The taking of Samos cloſed the long ſeries of Athenian conqueſts; and during the nine ſubſequent years, that magnanimous people alternately enjoyed and abuſed the bleſſings of peace and proſperity. Their oſtentatious diſplay of power increaſed the envy and terror of Greeks and Barbarians, and excited the obſtinate and bloody war of twenty-ſeven years, which was ſoon to follow, and which was exerted to demoliſh or uphold the ſtately edifice of empire that had been reared by the ambitious patriotiſm of Pericles. Aſſiſted by feeble or reluctant allies, Athens long ſtruggled againſt the combined ſtrength of Peloponneſus, Bœotia, Macedon, Sicily, and Perſia; and hence our curioſity is more forcibly attracted towards the internal reſources and moral character of a people, who, with few natural advantages, could make ſuch memorable efforts, and who, amidſt the din of arms, ſtill cultivating and improving their favourite arts, produced thoſe inimitable monuments of taſte and genius, which, ſurviving the deſtruction of their walls, have ever atteſted the glory of Athens over the united vengeance of her enemies. But her progreſs in the ſcience of government and laws, which gives ſecurity to all other ſciences, merits the foremoſt place in our attention; nor, at this diſtance of time, will the enlightened reader contemplate with indifference the laws of Athens, which having been incorporated into the Roman juriſprudence about the middle of the fifth century before Chriſt, ſerved, after an interval of above ſixteen hundred years, to ſoften and ameliorate the rugged diſcipline of the Gothic legiſlation, and to introduce juſtice, ſecurity, and refinement, among the modern nations of Europe.

The very imperfect laws of Draco, who flouriſhed thirty years before Solon, proved that the Athenians felt the want of a ſcience, which they knew not how to acquire or cultivate. This want was deſtined to be ſupplied from the ſuperior ſtores of juſtice and equity, which dignified the mental endowments of Solon. He maintained the ancient diviſion of property, but aboliſhed debts. He eſtabliſhed the rate of intereſt at twelve per cent. at which it afterwards remained; but forbade, that the inſolvent debtor ſhould become the ſlave of his creditor, or be compelled to ſell his children into ſervitude. After theſe preliminary regulations, he divided the Athenians into four claſſes, according to the produce of their eſtates. The firſt claſs conſiſted of thoſe whoſe lands annually yielded five hundred meaſures of liquid as well as dry commodities, and the minimum of whoſe yearly income may be calculated at ſixty pounds ſterling; which is equivalent, if we eſtimate the relative value of money by the price of labour, and of the things moſt neceſſary to life, to about ſix hundred pounds ſterling of the preſent age. The ſecond claſs conſiſted of thoſe whoſe eſtates produced three hundred meaſures; the third of thoſe whoſe eſtates produced two hundred; the fourth, and by far the moſt numerous claſs, either poſſeſſed no landed property, or at leaſt enjoyed not a revenue in land equal to twenty-four pounds ſterling, or, agreeably to the above proportion, two hundred and forty pounds of our preſent currency. But all ranks of citizens were alike admitted to vote in the public aſſembly, and to judge in the courts of juſtice, whether civil or criminal, which were properly ſo many committees of the aſſembly. But the three firſt claſſes were excluſively entitled to ſit in the ſenate, to decide in the Areopagus, or to hold any other office of magiſtracy. To theſe dignities they were elected by the free ſuffrages of the people, to whom they were accountable for their adminiſtration, and by whom they might be puniſhed for malverſation or negligence, although they derived no emolument from the diligent diſcharge of their duty.

The ſenate of four hundred, which, eighty-ſix years after its inſtitution, was augmented to five hundred by Cliſthenes, enjoyed the prerogatives of convoking the popular aſſembly; of previouſly examining all matters before they came to be decided by the people, which gave them a negative before debate in all public reſolutions; and of making laws which had force during a year, without requiring the conſent of the populace. Beſides this general authority, the ſenate was excluſively inveſted with many particular branches of the executive power. The preſident of that council had the cuſtody of the public archives and treaſury. The ſenate alone built ſhips; equipped fleets and armies; ſeized and confined ſtate criminals; examined and puniſhed ſeveral offences, which were not expreſsly forbidden by any poſitive law. The weight of ſuch a council, which aſſembled every day, except feſtivals, infuſed a large mixture of ariſtocracy into the Athenian conſtitution; and this was ſtill farther increaſed by the authority of the Areopagus, a court ſo named from the place where it was held; a hill ſacred to Mars, adjoining to the citadel.



SOLON.

Published as the Act directs. August 22. 1807. by J. Wilkes.

The principal magiſtrates erected in Athens were the nine archons, the firſt of whom gave his name to the year, and preſided in the civil courts of juſtice, where a committee of the people, choſen from all claſſes by lot, ſat as judges and jury. The archon next in dignity, who had the appellation of king, preſided in cauſes reſpecting religion, and things ſacred. The archon third in dignity, with his aſſeſſors the generals, preſided in military matters; and the ſix remaining, who were known by the appellation of *theſmothetæ*, heard criminal pleas of various kinds, or rather directed the proceedings of the ſix courts where criminal cauſes were examined and determined. Theſe nine archons, like all other Athenian magiſtrates, were, at the expiration of their annual office, accountable to the people; and when their conduct, after a ſevere ſcrutiny, appeared to merit public approbation and gratitude, they were received, and remained for life, members of the Areopagus, which, in dangerous emergencies, was entitled to aſſume a ſort of dictatorial power.

Such is the great outline of the conſtitution eſtabliſhed by Solon, according to which every Athenian citizen enjoyed the ineſtimable privilege of being judged by his peers, and tried by laws to which he himſelf had conſented. Although the legiſlative and judicial powers were thus lodged with the people, men of property and ability were alone entruſted with the adminiſtration of government; and as power in ſome meaſure followed property, the ſame expedient which ſerved to maintain a due diſtinction of ranks in ſociety, tended alſo to promote the induſtry and frugality of the multitude, that they might thereby become entitled to ſhare thoſe honours and offices, to which perſons of a certain eſtate only could aſpire. Hence the laws of Solon were of the moſt extenſive nature, comprehending not only rules of right, but maxims of morality, regulations of commerce, and precepts of agriculture. To deſcribe his inſtitutions reſpecting ſuch matters as are properly the objects of legiſlation, would be explaining thoſe great but familiar principles, concerning marriage, ſucceſſion, teſtaments, the rights of *perſons* and of *things*, which, through the medium of the Roman law, have been conveyed into the juriſprudence of all the civiliſed nations of Europe. His laws concerning education and manners prove that drunkenneſs and unnatural love were the predominant vices of thoſe early times. It was a particular duty of the archons, to prevent or puniſh offences committed in conſequence of intoxication; and the regulations concerning ſchools, which were not to be opened till ſun-riſe, which were ordered to be ſhut before night, and into which none but ſuch relations of the maſter, as were particularly ſpecified by law, could on any pretence be admitted, marked the utmoſt ſolicitude to root out an evil which infected and diſgraced the Athenian character.—It was for the purification and amelioration of which character, added to his ſuperior ſagacity and contempt of earthly grandeur, that Solon was dignified with the epithet of one of the wiſe men of Greece; yet was he doomed, like the celebrated lawgiver Lycurgus, not to reſt his aſhes where he had acquired his fame: he died in the iſland of Cyprus, when about eighty years of age.

The uſurpation of Piſiſtratus, though it deſtroyed for a time the political liberty of Athens, gave ſtability to moſt of the laws introduced by Solon. That extraordinary *tyrant* was not more diſtinguiſhed by the loftineſs of his genius than the humanity of his diſpoſition; and had not the violence of contending factions, and the fury of his enemies, inflamed his natural love of power, the name of Piſiſtratus might ſtand the foremoſt in the liſt of Grecian patriots and heroes. His valour and conduct were ſignalized in the conqueſt of Niſæa, Salamis, Naxos, Delos, and Sigæum; and if he diſplayed boldneſs and addreſs in acquiring ſovereignty, he diſplayed ſtill more moderation and virtue in adminiſtering it. He aſſumed, indeed, the royal dignities of prieſt and general, and took care that the chief offices of magiſtracy ſhould be filled by his partiſans. But he maintained the regular courſe of law and juſtice, not only by his authority, but by his example. He not only enforced the laws of Solon againſt idleneſs, but endeavoured to give them more efficacy by introducing new arts and manufactures into Attica. He was the firſt who brought into that country the complete collection of Homer's poems, which he commanded to be ſung at the Panathenæan feſtival; nor can we ſuppoſe that he ſhould have been zealous to diffuſe the liberal and manly ſentiments of that divine poet, if his government had not reſembled the moderation and equity of the heroic ages, rather than the deſpotiſm of tyrants.

His ſon Hipparchus imitated and ſurpaſſed the mild virtues of his father; and, amidſt the turbulence of the later democracy, it was acknowledged with a ſigh by the Athenians, that their anceſtors were indeed happy under Solon and Piſiſtratus, but that the reign of the tyrant Hipparchus brought back on earth the golden days of Saturn. The father had required a tenth part of the produce of Attica, to ſupport his guards, and the other appendages of royalty: his more generous ſon remitted one half of this impoſition. While he alleviated the burdens, yet encouraged the induſtry, of his ſubjects, by building the temple of Olympian Jupiter, he was ſolicitous to diſpel their ignorance and barbarity by erecting pillars in every part of the city, engraved with elegiac verſes, containing leſſons of wiſdom and precepts of morality. He collected the firſt library in Athens; and his liberal rewards, and ſtill more his agreeable manners and winning affability, attracted to that city the moſt diſtinguiſhed poets of the age. The murder of Hipparchus exaſperated the temper of his brother and ſucceſſor Hippias; but notwithſtanding the calamities which the latter inflicted and ſuffered, it muſt be allowed that the government of Piſiſtratus and his family, which, with various interruptions, laſted ſixty-eight years, increaſed the ſtrength and promoted the refinement of Athens. See ATTICA, vol. ii. p. 502.

But for the ſuperiority of her progreſs in the arts, Athens was chiefly indebted to the laudable efforts of Pericles and Phidias. It was the peculiar felicity of Pericles, to find Athens provided not only with all the materials of art, but with artiſts capable of employing them to the beſt advantage. In the inaccurate, but expreſſive, language of Pliny, ſculpture and painting then firſt aroſe, under the plaſtic hands of Phidias and his brother Panænus. Both arts, however, are known to have exiſted at a much earlier date; but in the age of Pericles they firſt aſſumed their due honours. The inventive genius of man tried a new and nobler flight. The ſuperiority of Phidias and his contemporaries obſcured, and almoſt obliterated, the memory of their predeceſſors, and produced that ſublime ſtyle, which, having flouriſhed about an hundred and fifty years, decayed with the glory of Greece, and diſappeared ſoon after the reign of Alexander.

It appears from the gems and medals, and the few remains in marble, preceding the age of Pericles, that the mechanical part of engraving and ſculpture had already attained a high degree of perfection. But in ſtatuary, the ſuperior merit of Phidias was acknowledged by the unanimous admiration of independent and rival communities. Intruſted by Pericles with the ſuperintendence of the public works, his own hands added to them their laſt and moſt valuable ornaments. Before he was called to this diſtinguiſhed employment, his ſtatues had adorned the moſt celebrated temples of Greece. His Olympian Jupiter, his ſtatues of Apollo and Diana, his Minerva of twenty-ſix cubits high, his group of twelve Grecian heroes ſurrounding the Trojan horſe, his ſtatue of the goddeſs of Vengeance, his Venus Urania, and Parthenopean Apollo, his three Minervas

ſculptured

ſculptured for the Pallenians, Platæans, and Lemnians, preſent ſo many aſſemblages of inimitable works, which at once confound and ſilence the voice of envy. During the ſhort period of fifteen years he completed the Odeum, or theatre of muſic; the Parthenon, or temple of Minerva; the Propylæa or veſtibule, and the porticoes belonging to the citadel, together with the pictureſque ornaments of many other immortal works; which, when new, expreſſed the mellowed beauties of time and maturity; and when old, ſtill preſerved the freſh charms and alluring graces of novelty. Even their ruins have continued to be prized, up to the preſent day, as the beſt and moſt invaluable models for modern artiſts.

By the luſtre of the elegant arts, the magnificence of Pericles had diſplayed and ennobled the military glory of his country; and the pre-eminence of Athens ſeemed eſtabliſhed on the ſolid foundation of internal ſtrength and external grandeur. But this abundant meaſure of proſperity ſatisfied neither the active ambition of the republic, nor the enterpriſing genius of its miniſter. The Greeks beheld and admired, but had not yet formally acknowledged, the full extent of Athenian greatneſs. In order to extort this reluctant tribute, Pericles diſpatched ambaſſadors to the different republics and colonies in Europe and in Aſia, requiring the preſence of their deputies in Athens, to concert meaſures for rebuilding their ruined temples, and for performing the ſolemn vows to the immortal gods, who had wonderfully protected the Grecian arms, during their long and dangerous conflict with the Perſian empire. This propoſal, which tended to render Athens the common centre of deliberation and of union, was readily accepted in ſuch foreign parts as had already ſubmitted to the authority of that republic. But in moſt aſſemblies of the Peloponneſus the ambaſſadors were heard with ſecret diſguſt; and the pride of the Spartan ſenate openly derided the inſolence of their demands. When, at their return home, they explained the behaviour of the Spartans, Pericles exclaimed, in his bold ſtyle of eloquence, that he "beheld war advancing with wide and rapid ſteps from the Peloponneſus."

But before we relate the events which immediately occaſioned this memorable war of twenty-ſeven years, it is impoſſible, (if the calamities of our own times have taught us to compaſſionate the miſerable,) not to drop a tear over the continual diſaſters which ſo long and ſo cruelly afflicted the moſt valuable and enlightened portion of mankind, and whoſe immortal genius was deſtined to enlighten the remoteſt ages of the world. When rude illiterate peaſants are ſummoned to mutual hoſtility, and, unaffected by perſonal motives of intereſt or honour, expend their ſtrength and blood to gratify the ſordid ambition of their reſpective tyrants, we may lament the general ſtupidity and wretchedneſs of human nature without ſympathiſing with men who have ſo little ſenſibility, who ſeem unwilling or unable to reliſh pleaſure. But the war of Peloponneſus preſents a different ſpectacle. The adverſe parties took arms, not to ſupport the unjuſt pretenſions of a tyrant, whom they had reaſon to hate or to deſpiſe, but to vindicate their civil rights, and to maintain their political independence. The meaneſt Grecian ſoldier knew the duties of the citizen, the magiſtrate, and the general. His life had been equally divided between the moſt agreeable amuſements of leiſure, and the moſt honourable employments of activity. Trained to thoſe exerciſes and accompliſhments which gave ſtrength and agility to the limbs, beauty to the ſhape, and grace to the motions, the dignity of his external appearance announced the liberal greatneſs of his mind; and his language, the moſt harmonious and expreſſive ever ſpoken by man, comprehended all that variety of conception, and all thoſe ſhades of ſentiment, that characteriſe the moſt exalted perfection of human manners.

Ennobled by ſuch actors, the ſcene itſelf was highly important, involving not only the ſtates of Greece, but the greateſt of the neighbouring kingdoms; and, together with the extent of a foreign war, exhibited the intenſeneſs of domeſtic ſedition. As it exceeded the ordinary duration of human power or reſentment, it was accompanied with unuſual circumſtances of terror, which, to the pious credulity of an unfortunate age, naturally announced the wrath of heaven, juſtly provoked by human cruelty. While peſtilence and famine multiplied the actual ſufferings, eclipſes and earthquakes increaſed the conſternation and horror, of that lamentable period. Several warlike communities were expelled from their hereditary poſſeſſions; others were not only driven from Greece, but utterly extirpated from the earth; ſome fell a prey to party rage, others to the vengeance of foreign enemies; ſome were ſlowly exhauſted by the contagion of a malignant atmoſphere, others overwhelmed at once by ſudden violence; while the combined weight of calamity aſſailed the power of Athens, and precipitated the downfal of that republic from the pride of proſperous dominion, to the dejection of dependence and miſery.

The general but latent hoſtility of the Greeks was firſt called into action by a rupture between the ancient republic of Corinth, and its flouriſhing colony Corcyra. The origin and proſperity of the Carthaginians have been already detailed under the article CARTHAGE, vol. iii. p. 836, to which the reader is referred. It appears that this ancient and celebrated people, even long before the invaſion of Xerxes, were the moſt powerful commercial nation in the world. The centre of their empire was ſurrounded by a cluſter of colonies and tributary cities, which extended above a thouſand miles along the coaſt of Africa. They were maſters of Sardinia and the northern coaſt of Sicily. They had eſtabliſhed colonies in Corſica, in Malta, and the Baleārian iſles; and their commercial ambition was diſtinguiſhed by an excluſive and jealous ſpirit, which ſought to ſtifle and depreſs the growing improvements of the Grecian colonies in Italy, which, within the courſe of ſixty years, had received ſuch acceſſions of ſtrength and ſplendour, as entitled thoſe countries to the appellation of Magna Græcia, of which the modern city of Naples was deemed the capital. See MAGNA GRÆCIA, p. 381, of this volume.

Beſides their powerful colonies in Corcyra, Leucas, Anactorium, Ambracia, whoſe tranſactions form ſuch an important part of the hiſtory of ancient Greece, the Corinthians had founded Syracuſe, the capital of Sicily. Among all theſe eſtabliſhments, it happened that the haughty ſpirit of Corcyra, elated with the pride of wealth and naval greatneſs, diſdained thoſe marks of deference and reſpect which practice had exacted from colonies towards their mother-country. At the Olympic and other ſolemn feſtivals, they yielded not the place of honour to the Corinthians; they appointed not a Corinthian high-prieſt to preſide over their religion; and when they eſtabliſhed new ſettlements on diſtant coaſts, they requeſted not the auſpicious guidance of a Corinthian conductor. This was the origin of a war, in which Athens was induced to take a decided part againſt the Corinthians, and in conſequence laid ſiege to Potidæa. While theſe hoſtile tranſactions were carrying into effect, the centre of Greece was ſhaken by the murmurs and complaints of the Corinthians and their Peloponneſian confederates, who loſt all patience when their citizens were blocked up by an Athenian army. Accompanied by the deputies of ſeveral republics beyond the iſthmus, they had recourſe to Sparta, whoſe actual power and ancient renown juſtly merited a high rank in the confederacy, but whoſe meaſures were rendered ſlow and cautious by the foreſight of Archidamus, who exhorted his countrymen not to ruſh blindly on war, without examining the reſources of the enemy and their own. The Athenians were powerful in ſhips,

in

in money, in cavalry, and in arms; of all which the Lacedæmonians were deſtitute, or, at leaſt, but feebly provided. Whatever provocation, therefore, they had received, they ought in prudence to diſſemble their reſentment, until they could effectually exert their vengeance. Had this moderate language made any impreſſion on the aſſembly, it would have been ſpeedily obliterated by the blunt boldneſs of Sthenelaides, one of the ephori, who cloſed the debate. "Men of Sparta! Of the conduct of the Athenians I underſtand not the drift. If we would maintain our character, we muſt not overlook their injuſtice. *They* have ſhips, money, and horſes; but *we* have good allies, whoſe intereſts we muſt not abandon. Why do we deliberate, while our enemies are in arms? Let us take the field, with ſpeed, and fight with all our might." The acclamations of the people followed, and war was reſolved.

This reſolution was taken in the fourteenth year after the concluſion of the thirty years' peace, and in the year before Chriſt 431; but near a twelvemonth elapſed before the proper meaſures for invading Attica could be finally adjuſted among the diſcordant members of ſo numerous a confederacy. It conſiſted of all the ſeven republics of the Peloponneſus, except Argos and Achaia, the firſt of which from ambition, and the ſecond perhaps from moderation, preſerved, in the beginning of the war, a ſuſpicious neutrality. Of the nine northern republics, Acarnania alone declined joining the allies, its coaſt being particularly expoſed to the ravages of the Corcyrean fleets. The cities of Naupactus and Platæa, were totally devoted to their Athenian protectors; whoſe cauſe was likewiſe embraced by ſeveral princes of Theſſaly. But all the other ſtates beyond the iſthmus reſolved to follow the ſtandard of Sparta, and to humble the aſpiring ambition of their powerful neighbour.

The repreſentatives of theſe various communities having, according to the received practice of Greece, aſſembled in the principal city of the confederacy, were ſtrongly encouraged by the Corinthians, who, as their colony of Potidæa was cloſely beſieged, laboured to accelerate repriſals on Attica, by exhibiting the moſt advantageous proſpect of the approaching war. In order to gain time, however, for ſettling all matters among themſelves, the confederates diſpatched to Athens various overtures of accommodation, which they well knew would be indignantly rejected. In each embaſſy they roſe in their demands, ſucceſſively requiring the Athenians to raiſe the ſiege of Potidæa; to repeal their prohibitory decree againſt Megara; to withdraw their garriſon from Ægina; in fine, to declare the independence of their colonies. Theſe demands were heard at Athens with a mixture of rage and terror. The capricious multitude, who had hitherto approved and admired the aſpiring views of Pericles, now trembled on the brink of the precipice to which he had conducted them. They had hitherto puſhed the ſiege of Potidæa with great vigour, but without any near proſpect of ſucceſs. They muſt now contend with a numerous confederacy, expoſe their boaſted grandeur to the doubtful chance of war, and exchange the amuſements and pleaſures of the city for the toils and hardſhips of a camp. Of theſe diſcontented murmurs, the rivals and enemies of Pericles greedily availed themſelves to traduce the character and adminiſtration of that illuſtrious ſtateſman. Diopeithes, Dracontides, and other demagogues, derided the folly of taking arms on every frivolous pretence; and, preparatory to the impeachment of Pericles, the courts of juſtice were fatigued with proſecutions of his faithful friends.

The accuſation of Pericles himſelf ſoon followed. He was reproached with embezzling the public treaſure; but, on this occaſion, plain facts confounded the artifices of his enemies. It was proved, that his private expences were juſtly proportioned to the meaſure of his patrimony; many inſtances were brought of his generous contempt of wealth in the ſervice of his country; and it appeared, after the ſtricteſt examination, that his fortune had not increaſed ſince he was intruſted with the exchequer. This honourable diſplay of unſhaken probity, which had ever formed the baſis of the authority of Pericles, again reconciled to him the affections of his countrymen, and gave irreſiſtible force to that famous and fatal ſpeech, which unalterably determined the war of Peloponneſus.

"Often have I declared, Athenians! that we muſt not obey the unjuſt commands of our enemies. I am ſtill firmly of that mind, convinced as I am of the dangerous viciſſitudes of war and fortune; and that human hopes, deſigns, and purſuits, are all fleeting and fallacious. Yet, in the preſent criſis, neceſſity and glory ſhould alike fix us to this immoveable reſolution. The decree againſt Megara, which the embaſſy required us to repeal, is not the cauſe of that hoſtile jealouſy which has long ſecretly envied our greatneſs, and which has now more openly conſpired our deſtruction. Yet that decree, of which ſome men have ſpoken ſo lightly, involved the honour of our councils and the ſtability of our empire. By puſillanimouſly repealing it, we ſhould have emboldened that malignant enmity, which, notwithſtanding our proper firmneſs in the firſt inſtance, has yet ſucceſſively riſen to higher and more arbitrary demands; demands which merit to be anſwered, not by embaſſies, but by arms.

"The flouriſhing reſources, and actual ſtrength, of the republic, afford us the moſt flattering proſpect of military ſucceſs. Impregnably fortified by land, our ſhores are defended by three hundred gallies; beſides a body of cavalry, to the number of twelve hundred, together with two thouſand archers, we can immediately take the field with thirteen thouſand pikemen, without draining our foreign garriſons, or diminiſhing the complete number of ſixteen thouſand men who defend the walls and fortreſſes in Attica. The wealthy ſea-ports of Thrace and Macedon; the flouriſhing colonies of Ionia, Eolia, and Doria; in a word, the whole extenſive coaſt of the Aſiatic peninſula, acknowledge, by annual contributions, the ſovereignty of our guardian navy, whoſe ſtrength is increaſed by the ſhips of Chios, Leſbos, and Corcyra, while the ſmaller iſlands furniſh us, according to their ability, with money and troops. Athens thus reigns queen of a thouſand tributary republics; and notwithſtanding the expences incurred by the ſiege of Potidæa, and the architectural ornaments of the city, ſhe poſſeſſes ſix thouſand talents in her treaſury.

"The ſituation of our enemies is totally the reverſe. Animated by rage, and emboldened by numbers, they may be rouſed to a tranſient deſultory aſſault; but deſtitute of reſources, and divided in intereſts, they are totally incapable of any ſteady perſevering exertion. With ſixty thouſand men they may enter Attica; and if our unſeaſonable courage gives them an opportunity, may win a battle; but unleſs our raſh imprudence aſſiſts and enables them, they cannot poſſibly proſecute a ſucceſsful war. Indeed, Athenians! I dread leſs the power of the enemy, than your own ungovernable ſpirit. Inſtead of being ſeduced from your ſecurity, by a vain deſire to defend, againſt ſuperior numbers, your plantations and villas in the open country, you ought to deſtroy thoſe ſuperfluous poſſeſſions with your own hands. To you, who receive the conveniences of life from ſo many diſtant dependencies, the devaſtation of Attica is a matter of ſmall moment; but how can your enemies repair, how can they ſurvive, the devaſtation of the Peloponneſus? How can they prevent, or remedy, this fatal, this intolerable, calamity, while the ſquadrons of Athens command the ſurrounding ſeas? If theſe conſiderations be allowed their full weight; if reaſon, not paſſion, conducts the war; it ſeems ſcarcely in the

power of fortune to rob you of victory. Yet let us anſwer the Peloponneſians with moderation, "that we will not forbid the Megareans our ports and markets, if the Spartans, and other ſtates of Greece, aboliſh their excluſive and inhoſpitable laws: that we will reſtore independent governments to ſuch cities as were free at the laſt treaty of peace, provided the Spartans engage to follow our example: that we are ready to ſubmit all differences to the impartial deciſion of any equitable tribunal: and that, although theſe condeſcending overtures be rejected, we will not commence hoſtilities, but are prepared to repel them with our uſual vigour." The aſſembly murmured applauſe; a decree was propoſed and ratified; the ambaſſadors returned home with the reply dictated by Pericles; which, moderate as it ſeemed to the Athenian ſtateſman, founded like an immediate declaration of war to the Spartans and their allies.

The ſword was now drawn, and both parties ſeemed eager to exert their utmoſt ſtrength. The Spartans ſummoned their confederates to the iſthmus; demanded money and ſhips from their Italian and Sicilian colonies; and ſolicited aſſiſtance from the Perſian monarch Artaxerxes, and from Perdiccas king of Macedon; both of whom regarded the Athenians as dangerous and ambitious invaders of their coaſts. The people of Athens, on the other hand, contracted an alliance with Sitalces, the warlike chief of the Odryſians, who formed the moſt powerful tribe in Upper Thrace. They required at the ſame time an immediate ſupply of cavalry from their Theſſalian allies, while the fleet already cruiſed along the coaſt of Peloponneſus, to confirm the fidelity of the ſurrounding iſlands. Such was the ardour of preparation, that only a few weeks after the ſurpriſe of Platæa, the Lacedæmonian confederates, to the number of ſixty thouſand, aſſembled from the north and ſouth, at the Corinthian iſthmus, and the general conduct of the war was intruſted to Archidamus, the Spartan king.

In a council of the chiefs, that prince warmly approved their alacrity in taking the field, and extolled the greatneſs and bravery of an army, the moſt numerous and beſt provided that had ever followed the ſtandard of any Grecian general. Yet their preparations, however extraordinary, were not greater than their enterpriſe required. They waged war with a people not leſs powerful than active and daring; who had diſcernment to perceive, and ability to improve, every opportunity of advantage; and whoſe reſentment would be as much inflamed, as their pride would be wounded, by the approach of invaſion and hoſtility. It ſeemed probable, that the Athenians would not allow their lands to be waſted, without attempting to defend them. The confederates, therefore, muſt be always on their guard; their diſcipline muſt be ſtrict, regular, and uniform; to elude the ſkill, and to oppoſe the ſtrength, of Athens, demanded their utmoſt vigilance and activity.

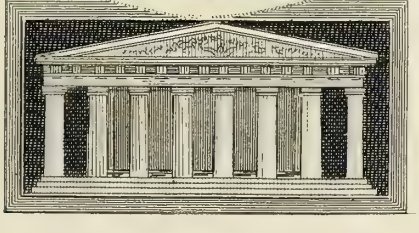
Archidamus, after leading his army into Attica, ſeems blameable in allowing their martial ardour to evaporate in the fruitleſs ſiege of Oenoè, the ſtrongeſt Athenian town towards the ſouthern frontier of Bœotia. This tedious and unſucceſsful operation enabled the Athenians to complete, without interruption the ſingular plan of defence ſo ably traced by the bold genius of Pericles. They haſtened the deſolation of their own fields; demoliſhed their delightful gardens and villas, which it had been their pride to adorn; and tranſported, either to Athens or the iſles, their valuable effects, their cattle, furniture, and even the frames of their houſes. This induced the confederate army to raiſe the ſiege of Oenoè, and to advance along the eaſtern frontier of Attica; and, having laid waſte that valuable diſtrict with fire and ſword, they proceeded to Eleuſis, and from thence to Acharnæ, only eight miles diſtant from the capital. But the Athenian ſquadron of an hundred and fifty ſail was now ravaging the defenceleſs coaſt of Peloponneſus, intelligence of which, and ſtill more the ſcarcity of proviſions, obliged the confederates to return home to defend their reſpective republics.

The winter was not diſtinguiſhed by any important expedition on either ſide; but the return of ſummer brought back into Attica the Peloponneſian invaders; and it likewiſe introduced a far more dreadful calamity. A deſtructive peſtilence, engendered in Ethiopia, infected Egypt, and ſpread over great part of the dominions of the king of Perſia. Hiſtory does not explain by what means this fatal diſorder was communicated to Greece. The diſeaſe firſt appeared in the Piræus; and the inhabitants ſuſpected that the enemy had poiſoned their wells. But it ſoon extended over the adjoining diſtricts, and raged with peculiar violence in the populous ſtreets which ſurrounded the citadel. All remedies, human and divine, were employed in vain to ſtop the progreſs of this fatal contagion. The miſerable crowds expired in the temples, preferring unavailing prayers to the gods. A ſhocking ſpectacle was ſeen round the ſacred fountains, where multitudes lay dead, or periſhed in agoniſing tortures.

While the city fell a prey to this cruel malady, the country was laid waſte by an implacable enemy. On the preſent occaſion, the confederates advanced beyond Athens; deſtroyed the works of the miners on mount Laurium; and, having ravaged all that ſouthern diſtrict, as well as the coaſt oppoſite to Eubœa and Naxos, they traced a line of devaſtation along the Marathonian ſhore, the glorious ſcene of the immortal victory obtained by the valour of Athens, in defence of thoſe very ſtates by which her own territories were now deſolated.

If conſcious wiſdom and rectitude were not ſuperior to every aſſault of fortune, the manly ſoul of Pericles muſt have ſunk under the weight of ſuch multiplied calamities. But his fortitude ſtill ſupported him amidſt the flood of public and domeſtic woe. With decent and magnanimous compoſure, he beheld the unhappy fate of his numerous and flouriſhing family, ſucceſſively ſnatched away by the rapacious peſtilence. At the funeral of the laſt of his ſons, he dropped, indeed, a few reluctant tears of paternal tenderneſs; but, aſhamed of this momentary weakneſs, he bent his undejected mind to the defence of the republic. Having collected an hundred Athenian, together with fifty Chian or Leſbian, veſſels, he ſailed through the Saronic gulph, and ravaged the coaſts of Elis, Argos, and Laconia. While this armament weighed anchor in the Piræus, there happened an eclipſe of the ſun, which terrified the ſuperſtitious mariners, whoſe minds were already clouded by calamity. The pilot of the admiral galley betrayed the moſt unmanly cowardice, when Pericles, throwing a cloak before his eyes, aſked, "whether the obſcurity ſurpriſed him?" the pilot anſwering him in the negative, "Neither," rejoined Pericles, "ought an eclipſe of the ſun, occaſioned by the intervention of a revolving planet, which intercepts its light."

Having arrived on the Argolic coaſt, the Athenians laid ſiege to the ſacred city of Epidaurus, whoſe inhabitants gloried in the peculiar favour of Æſculapius. The plague again breaking out in the fleet, was naturally aſcribed to the vengeance of that offended divinity. They raiſed the ſiege of Epidaurus; nor were their operations more ſucceſsful againſt Troezenè, Hermionè, and other Peloponneſian cities. They took only the ſmall fortreſs of Praſiæ, a ſea-port of Laconia; after which they returned to the Piræus, afflicted with the peſtilence, and without having performed any thing that correſponded to the greatneſs of the armament, or the public expectation. The Athenian expedition into Thrace was ſtill more unfortunate. Into that country Agnon conducted a body of four thouſand men, to cooperate with Phormio in the ſiege of Potidæa. But in the ſpace of forty days, he loſt one thouſand and fifty men in the plague; and the only conſequence of his expedition



PERICLES.

London. Published as the Act directs. Sept.r 12. 1807. by J. Wilkes

pedition was, to infect the northern army with that dreadful diſorder.

Theſe multiplied diſaſters reduced the Athenians to deſpair. Their ſufferings exceeded example and belief, while they were deprived of the only expected conſolation, the pleaſure of revenge. The bulk of the people deſired peace on any terms. Ambaſſadors were ſent to Sparta, but not admitted to an audience. The orators clamoured, and traduced Pericles. The undiſcerning populace aſcribed their misfortunes to the unhappy effect of his counſels: but his magnanimity did not yet forſake him; and, for the laſt time, he addreſſed the aſſembly with his uſual ſucceſs. The integrity and manly firmneſs of his mind reſtored the fainting courage of the republic. They reſcued the dignity of Pericles from the rage of popular frenzy; but they could not defend his life againſt the infectious malignity of the peſtilence, which carried him off two years and ſix months after the commencement of the war. He expired, teaching an invaluable leſſon to human kind, that in the laſt important hour, when all other objects diſappear, or loſe their value, the recollection of an innocent life is ſtill preſent to the mind, and ſtill affords conſolation, more valuable than Pericles could derive from his nine trophies erected over the enemies of his country, from his long and proſperous adminiſtration of forty years, the depth of his political wiſdom, the perfection of his military and naval ſkill, and the immortal fame of his unrivalled eloquence.

The dignity and vigour of the republic ſeemed to periſh with Pericles, and ſeveral years elapſed, ſcarcely diſtinguiſhed by any event that tended to vary the uniformity, much leſs to decide the fortune, of the war. While the Peloponneſians invaded Attica, the Athenian fleet annually ravaged the coaſt of Peloponneſus. In vain the inhabitants of that country, little accuſtomed to the ſea, collected ſhips and uſed their utmoſt endeavours to contend with the experienced ſkill of the Athenian mariners. They were always defeated, and often by an inferior force; one proof among many, that naval ſuperiority is ſlowly acquired, and ſlowly loſt. Neither the Athenians nor the Peloponneſians derived any effectual aſſiſtance from their reſpective alliances with Sitalces and Perdiccas. The former, reinforced by many independent tribes of Thrace, who were allured to his ſtandard by the hopes of plunder, poured down an hundred and fifty thouſand men on the Macedonian coaſt. But a haſty agreement between the two kings diſſipated that numerous and deſultory band with the ſame rapidity with which it had been collected.

The ſucceſs of the adverſe parties was equally balanced in the ſieges of Potidæa and Platæa. The former, having ſurrendered on capitulation, was occupied by new inhabitants. The expelled citizens retired to Olynthus and other places of the Chalcidice, where they ſtrengthened and exaſperated the foes of Athens. Platæa alſo capitulated, after a long and ſpirited reſiſtance during five years. Notwithſtanding the warm and affecting remonſtrances of the citizens who had acted ſuch an illuſtrious part in the Perſian war, when the Thebans behaved moſt diſgracefully, the capitulation was ſhamefully violated by the Spartans, who ſacrificed to the reſentment of Thebes, the eternal enemy of Platæa, two hundred brave men, whoſe courage and fidelity merited a better fate. But the youth of Platæa ſtill flouriſhed in the boſom of Athens, and were deſtined, in a future age, to re-aſſume the dignity of independent government, which always formed the higheſt ambition of their ſmall but magnanimous community.

If the Peloponneſian war had not been carried on with an animoſity unknown to the mildneſs of modern times, the long ſufferings of the contending parties would have diſpoſed them eagerly to deſire the bleſſings of tranquillity. But ſuch virulent paſſions rankled in Athens and Sparta, that while calamities were equally balanced, and the capitals of both republics were ſecure, no combination of adverſe circumſtances ſeemed ſufficient to determine either ſide to purchaſe peace by the ſmalleſt diminution of honour. Yet to this neceſſity, Sparta in the following year was reduced by a train of events, equally ſudden and ſingular. Demoſthenes, a general of merit and enterpriſe, commanded the Athenian forces at Naupactus. This town, as related above, had been beſtowed on the unfortunate Helots and Meſſenians; by whoſe aſſiſtance, together with that of the Athenian allies in Acarnania, Cephallenia, and Zacynthus, Demoſthenes undertook to reduce the hoſtile provinces of Ætolia, Ambracia, and Leucadia.

The Ætolians and Ambraciots, the moſt formidable enemies of the republic on the weſtern coaſt of Greece, ſolicited and obtained aſſiſtance from Lacedæmon and Corinth, vigorouſly attacked the towns of Naupactus and Amphilochian Argos, and threatened to reduce the whole province of Acarnania. The vigilance and activity of Demoſthenes not only ſaved theſe important cities, but obtained the moſt ſignal advantages over the aſſailants. With profound military ſkill he divided the ſtrength of the enemy, and, by a well-conducted ſtratagem, totally defeated the Ambraciots among the heights of Idomenè. Demoſthenes then attacked the camp of the Ambraciots, who were yet in their beds. The camp was no ſooner aſſaulted than the rout began. Many were ſlain on the ſpot; the reſt fled; but the paſſes were beſet, and the purſuers light-armed. Some ran to the ſea, and beheld a new object of terror, in ſome Athenian ſhips then cruiſing on the coaſt. Amidſt this complication of calamities, they plunged into the water, and ſwam to the hoſtile ſquadron, chooſing rather to be deſtroyed by the Athenians, than by the enemies from whom they had eſcaped. Theſe important ſucceſſes enabled Demoſthenes to return with honour to Athens, the term of his military command having expired.

During a long and deſultory war of ſeveral years, the Athenians were chiefly crowned with ſucceſs, and ſeveral times brought the Spartans to ſue for peace; but which, in the pride of victory, they choſe not to grant. Fortune firſt deſerted them in Bœotia, in the year before Chriſt 424. During ſeveral months their generals, Demoſthenes and Hippocrates, availing themſelves of the political factions of that country, had been carrying on ſecret intrigues with Chæronæa, Siphæ, and Orchomenus, places abounding in declared partizans of democracy, and eternally hoſtile to the ambition of Thebes. The inſurgents had agreed to take arms, in order to betray the weſtern parts of Bœotia to Demoſthenes, who ſailed with forty gallies from Naupactus; while Hippocrates, at the head of ſeven thouſand heavy-armed Athenians, and a much greater proportion of light-armed auxiliaries, invaded the eaſtern frontier of that province. It was expected, that, before the Thebans could bring a ſufficient force into the field, the invaders and inſurgents, advancing from oppoſite extremities of the country, might unite in the centre, and perhaps ſubdue Thebes itſelf, the moſt powerful, as well as moſt zealous, ally of Sparta. This plan, though concerted with ability, was found too complicated for execution. Demoſthenes ſteered towards Siphæ, before his coadjutor was ready to take the field; and the whole contrivance was betrayed by Nichomachus, a Phocian, to the Spartans, and by them communicated to the Bœotians. Demoſthenes at length entered the eaſtern frontier of Bœotia; and, as the principal deſign had miſcarried, contented himſelf with taking and fortifying Delium, a place ſacred to Apollo. Having garriſoned this poſt, he prepared for returning home. But while his army ſtill lay in the neighbourhood of Delium, the Thebans, encouraged by Pagondas, a brave and ſkilful leader, marched with great rapidity from Tanagra, in order to intercept his retreat. Their forces

amounted to eighteen thouſand; the Athenians were little leſs numerous. An engagement enſued, which national emulation rendered bloody and obſtinate. Before the battle Pagondas had detached a ſmall ſquadron of horſe, with orders to ride up after the commencement of the action. This ſtratagem was deciſive. The Athenians, terrified at the ſight of a reinforcement, which their fears magnified into a new army, were thrown into diſorder, and put to flight. Approaching darkneſs ſaved them from total deſtruction. They eſcaped diſgracefully into Attica, after leaving in the field of battle a thouſand pikemen, with their commander Hippocrates.

The Athenians had ſcarcely time to lament their loſſes in Bœotia, when they received intelligence of a calamity in another quarter, equally unexpected, and ſtill more alarming. This event is the more remarkable, becauſe it naturally aroſe out of the preceding proſperity of Athens, and the paſt misfortunes of Sparta. The train of ſucceſs which had attended the arms of Nicias and Demoſthenes in the eighth year of the war, alarmed the citizens of Olynthus and other places of the Chalcidicè, which, having embraced the earlieſt opportunity of revolting from the Athenians, now dreaded the vengeance of an incenſed and victorious people. Every ſoutherly wind threatened them with the approach of an Athenian fleet. But, as none of theſe dreaded dangers were realiſed, the inhabitants of the Chalcidicè gradually reſumed courage, put their towns in a poſture of defence, and craved aſſiſtance from their Peloponneſian allies. At the ſame time Perdiccas, king of Macedon, who regarded the Athenians as his ancient and natural enemies, ſent money into the ſouth of Greece, for the purpoſe of hiring ſoldiers, whom he intended to employ in reſiſting the encroachments of that ambitious people.

Such were the enemies whom Athens had rouſed; while the calamities of Sparta prompted her to ſupply the reinforcement of troops, which Perdiccas and the Chalcidians demanded. They ſent ſeven hundred Helots to the ſtandard of Braſidas, the Spartan chief, whoſe merit had recommended him to Perdiccas and the Chalcidians, as the general beſt qualified to manage the Macedonian war. About a thouſand ſoldiers where levied in the neighbouring cities of Peloponneſus; ſeveral Spartans cheerfully accompanied a leader whom they admired; and with this inconſiderable force Braſidas undertook an expedition highly important in its conſequences, and conducted with conſummate prudence and bravery.

Having traverſed the friendly countries of Bœotia and Phocis, he arrived at the foot of Mount Oëta, and penetrated through the narrow defiles confined between that ſteep and woody range of hills, and the boiſterous waves of the Malian gulf. The ſight of Thermopylæ animated the enthuſiaſm of the Spartans, and encouraged them to force their way through the hoſtile plains of Theſſaly; a country actually torn by domeſtic diſcord, but always friendly to the Athenians. The celerity of Braſidas anticipated the ſlow oppoſition of a divided enemy. Having reached the Macedonian town of Dium, he joined forces with Perdiccas, who propoſed directing the firſt operations of the combined army againſt Arribæus, leader of the barbarous Lynceſtæ. But even this barbarian knew the valour of the Spartans, and the equity of Braſidas. To the deciſion of the Grecian general he ſubmitted the difference between Perdiccas and himſelf, and engaged to abide by the award, however unfavourable to his intereſt.

Braſidas now haſtened to join the Chalcidians, by whom he was received with a degree of joy ſuitable to the impatience with which he had been expected. Amidſt the general defection of their neighbours, the towns of Acanthus and Stagirus ſtill maintained their allegiance to Athens. Braſidas appeared before the gates of Acanthus, while the peaceful inhabitants were preparing for the labours of the vintage. He ſent a meſſenger, craving leave to enter the place, and to addreſs the aſſembly. The Acanthians were divided in opinion; but the majority, fearing to expoſe their ripe fields and vineyards to the reſentment of his army, agreed to admit the general alone and unattended, and impartially to weigh whatever he propoſed for their deliberation. Braſidas, though a Spartan, was an able ſpeaker. He engaged the Acanthians to accept the friendſhip of Sparta. Stagirus, another city on the Strymonic gulf, readily followed the example, and opened its gates to the deliverer. During the enſuing winter, the meaſures of the Spartan general were conducted with equal ability and enterpriſe. His ſucceſsful operations againſt the inland towns facilitated the ſurrender of ſuch places as, by their maritime or inſular ſituation, were moſt expoſed to the vengeance of Athens, and therefore moſt averſe to revolt. His moderate uſe of victory enſured the good-will of the vanquiſhed. The various parts of a plan, thus artfully combined, mutually aſſiſted each other; the ſucceſs of one undertaking contributed to that of the next which followed it; and, at length, without any conſiderable miſcarriage, he had rendered himſelf maſter of moſt places in the peninſulas of Acta, Sithonia, and Pallenè.

The loſs of Amphipolis was that which moſt deeply afflicted the Athenians, and which at once ſhewed the ſuperior addreſs and dexterity of Braſidas. He formed a conſpiracy with the malcontents in the place, ſkilfully diſpoſed his army before the walls, and harangued the aſſembly of the people. A moſt ſeaſonable promptitude diſtinguiſhed all his meaſures; yet the Athenian Eucleus, who commanded the garriſon, found time to ſend a veſſel to Thaſos, requeſting immediate and effectual relief. The Athenians had committed the government of that iſland, as well as the direction of the mines on the oppoſite continent, to the celebrated hiſtorian of a war, in which he was a meritorious, though unfortunate, actor. Without a moment's delay, Thucydides put to ſea with ſeven gallies, and arrived in the mouth of the Strymon on the ſame day on which his aſſiſtance had been demanded. But it was too late to ſave Amphipolis. The Spartan general, who had exact information of all the meaſures of the beſieged, well knew the importance of anticipating the arrival of Thucydides, whoſe name was highly reſpected by the Greek colonies in Thrace, and whoſe influence was conſiderable among the native barbarians. Braſidas, therefore, propoſed ſuch a capitulation to the Amphipolitans as it ſeemed imprudent to refuſe. They were to be releaſed from the tribute which they had hitherto paid the Athenians; to enjoy the utmoſt degree of political independence, not inconſiſtent with the alliance of Sparta; even the Athenian garriſon, if they continued in the place, were to be entitled to all the rights of citizens; and ſuch perſons as choſe to leave it, were granted a reaſonable time to remove their families and their property. The laſt condition was embraced by the Athenians, and their more determined partizans. They retired to the neighbouring town of Eion, ſituate near the ſea, on the northern branch of the Strymon; a place ſecured againſt every hoſtile aſſault by the ſkill and activity of Thucydides.

Towards the end of winter, the full extent of Braſidas's ſucceſs was made known at Athens. The aſſembly was in commotion; and the populace were the more enraged at their loſſes, as it now appeared ſo eaſy to have prevented them, either by guarding the narrow defiles which led to their Macedonian poſſeſſions, or by ſending their fleet with a ſeaſonable reinforcement to their feeble garriſons in thoſe parts. Their own neglect had occaſioned the public diſgrace; but, with the uſual injuſtice and abſurdity accompanying popular diſcontents, they exculpated themſelves, and baniſhed their generals.

generals. Thucydides was involved in this cruel ſentence. In theſe propitious moments of general ſucceſs, the Spartans ſent an embaſſy to Athens to ſue for a truce, as a preliminary to a general peace. The Athenians readily entered into their views; it was determined that matters of ſuch importance ſhould be diſcuſſed with leiſure and impartiality; a truce was therefore agreed on for a year between the contending republics.

This tranſaction was concluded in the ninth ſummer of the war, and in the year 423 before Chriſt; but it was totally unexpected by Braſidas, who received the voluntary ſubmiſſion of Scionè and Menda, two places of conſiderable importance in the peninſula of Pallenè, before he was acquainted with the ſuſpenſion of hoſtilities. While the active valour of this general prevented the confirmation of peace, the conſcious worthleſsneſs of the Athenian general Cleon, promoted the renewal or rather the continuance of war. The glory of Athens was the perpetual theme of his diſcourſe. He exhorted his countrymen to puniſh the perfidy of Sparta, in abetting the inſolent revolt of Menda and Scionè; and to employ his own ſkill and bravery to repair their declining fortune in Macedonia. The Athenians liſtened to the ſpecious advice of this turbulent declaimer, who, in the enſuing ſpring, ſailed to the Macedonian coaſt with a fleet of thirty gallies, twelve hundred citizens heavy-armed, a ſquadron of three hundred horſe, and a powerful body of light-armed auxiliaries. The ſurrender of Menda and Torana, whoſe inhabitants were treated with every exceſs of cruelty, encouraged him to attack Amphipolis. With this deſign, having collected his forces at Eion, he waited the arrival of ſome Macedonian troops, promiſed by Perdiccas, who, having quarrelled with the Spartan general, now flattered the hopes of his antagoniſt.

The army of Cleon contained the flower of the Athenian youth, whoſe ardent valour diſdained a precarious dependence on barbarian aid. They accuſed the cowardice of their leader, which was only equalled by his incapacity, and lamented their own hard fate in being ſubjected to the authority of a man ſo unworthy to command them. The impatient temper of an arrogant demagogue was ill fitted to endure theſe ſeditious complaints. He haſtily led his troops before the place, without previouſly examining the ſtrength of the walls, the ſituation of the ground, the number or diſpoſition of the enemy. Braſidas, meanwhile, had taken proper meaſures to avail himſelf of the known imprudence of his adverſary. A conſiderable body of men had been concealed in the woody mountain Cerdylium, which overhangs Amphipolis. The greater part of the army were drawn up ready for action, at the ſeveral gates of the city. Clearidas, who commanded there, had orders to ruſh forth at a given ſignal, while Braſidas in perſon, conducting a ſelect band of intrepid followers, watched the firſt opportunity for attack. The plan, contrived with ſo much ſkill, was executed with equal dexterity and preciſion. Confounded with the rapidity of ſuch an unexpected and complicated charge, the enemy fled in all directions, abandoning their ſhields, and expoſing their naked backs to the ſwords and ſpears of the purſuers. The forces on either ſide amounted to about three thouſand; ſix hundred Athenians fell victims to the folly of Cleon, who, though foremoſt in the flight, was killed by the hand of a Myrcinian targeteer. His death was more than compenſated by the loſs of Braſidas, who received a mortal wound while he advanced to the attack. He was conveyed alive to Amphipolis, and enjoyed the conſolation of his laſt victory, in which only ſeven men had periſhed on the Spartan ſide.

The battle of Amphipolis, fought in the year before Chriſt 421, removed the principal obſtacles to peace. There was not any Spartan general qualified to accompliſh the deſigns of Braſidas. The Athenians, dejected by defeat, and humbled by diſgrace, wanted the bold impoſing eloquence of Cleon, to diſguiſe their weakneſs, and varniſh their misfortunes. With the diſheartened remains of an enfeebled armament, they deſpaired of recovering their Macedonian poſſeſſions; and the greater part returned home, well diſpoſed for an accommodation with the enemy. Theſe diſpoſitions were confirmed by the pacific temper of Nicias, who ſucceeded to the command, and fortunately diſcovered in the moderation of Pleiſtoanax, king of Sparta, a coadjutor extremely ſolicitous to promote his views. During winter, ſeveral friendly conferences were held between the commiſſioners of the two republics; and, towards the commencement of the enſuing ſpring, a treaty of peace, and ſoon afterwards a defenſive alliance, for fifty years, was ratified by the kings and ephori of Sparta on the one ſide, and by the archons and generals of Athens on the other. In conſequence of this negociation, which was intended to comprehend the reſpective allies of the contracting powers, all places and priſoners, taken in the courſe of the war, were to be mutually reſtored; the revolted cities in Macedon were ſpecified by name; and it was regulated that the Athenians ſhould not require from them any higher revenue than that apportioned by the juſtice of Ariſtides.

From the PEACE of NICIAS, to the fall of ATHENS, and TERMINATION of the PELOPONNESIAN WAR.

The turbulent citizens of Corinth have the odium of renewing a war, which their intrigues and animoſities had firſt kindled. Under pretence of having taken an oath never to abandon the Macedonian cities, they declined being parties in the general treaty of peace. Fully bent on war, they haſtened to Argos, in order to animate that republic with the ſame paſſions which rankled in their own breaſts. The Argives wanted neither power nor inclination to enter upon hoſtilities; and the Eleans, long hoſtile to Sparta, eagerly promoted the Argive alliance, which was farther ſtrengthened by the ſpeedy acceſſion of the Macedonian allies. But this democratical aſſociation ſoon acquired an acceſſion ſtill more important, even the republic of Athens. This extraordinary event happened in the year following the negociation between Athens and Sparta, and was effected through the intereſt of Alcibiades. Though he had not yet reached his thirtieth year, the age required by the wiſdom of Solon for being entitled to ſpeak in the aſſembly; yet he poſſeſſed every advantageous circumſtance of birth and fortune, talents natural and acquired, accompliſhments of mind and body, that pleaded an exception in favour of this extraordinary character, which, producing at once flowers and fruit, united with the blooming vivacity of youth the ripened wiſdom of experience. His father, the rich and generous Clinias, derived his extraction from the heroic Ajax, and had diſtinguiſhed his own valour and patriotiſm in the glorious ſcenes of the Perſian war. The tender years of Alcibiades were at firſt committed to the illiberal diſcipline of mercenary preceptors; he became, however, the pupil and favourite of the immortal Socrates. The ſage, whoſe company was courted by his other diſciples, himſelf courted the company of Alcibiades. At the battle of Potidæa he ſaved the life of his pupil; and, in order to gratify the love of military glory which already animated his youthful boſom, the ſage obtained for Alcibiades the prize of valour, which the univerſal conſent of the Athenians thought due to himſelf. At the fatal engagement of Delium, Alcibiades, it is ſaid, had an opportunity of returning the more ſubſtantial favour, by ſaving the life of Socrates; and it may well be ſuppoſed that an interchange of ſuch important favours would ſtraiten the bands of their mutual friendſhip, during which the

powers of reaſon and fancy were directed, with unabating diligence, to improve the underſtanding and excite the virtue of Alcibiades. But this favourite youth laboured under a defect, which could not be compenſated by the higheſt birth, the moſt ſplendid fortune, the nobleſt endowments of mind and body, and even the ineſtimable friendſhip of Socrates. He wanted an honeſt heart; as will appear from the ſubſequent events of the Peloponneſian war.

In compliance with the peace of Nicias, the Spartans withdrew their troops from Amphipolis; but they could reſtore neither that city, nor the neighbouring places in Macedon, to the dominion of Athens. Mutual unwillingneſs, or inability, to comply with the articles of peace, ſowed the ſeeds of animoſity, which found a favourable ſoil in both republics. The Spartan youth wiſhed, by new hoſtilities, to cancel the memory of a war, which had been carried on without profit, and terminated with diſhonour. But the wiſer part perceived that better ſucceſs could not be expected while the Athenians poſſeſſed Pylus. In their eagerneſs to recover that fortreſs, they renewed their alliance with the Thebans, from whom they received Panactum, which they hoped to exchange for Pylus; forgetting, in this tranſaction, an important clauſe in their treaty with Athens, "that neither of the contracting powers ſhould, without mutual communication and conſent, conclude any new alliance." The Thebans rejoiced in the proſpect of embroiling the affairs of Athens and Sparta; and the Corinthians, guided by the ſame hoſtile views, readily concurred with the Thebans, and openly re-entered into the Lacedæmonian confederacy.

Having concluded this negociation, the Spartans, who yielded to none in the art of diſſembling, diſpatched ambaſſadors to Athens, excuſing what they termed an apparent infringement of the treaty, and requeſting that ſtate to accept Panactum in exchange for Pylus. The ſenate of Athens heard their propoſal without ſuſpicion, eſpecially as they declared themſelves inveſted with full powers to embrace every reaſonable plan of preſent accommodation and permanent friendſhip. It now remained for the ambaſſadors to propoſe their demand in the popular aſſembly, which they had reaſon to hope might be deceived ſtill more eaſily than the ſenate. But in this expectation they were diſappointed by a contrivance of Alcibiades, no leſs ſingular than audacious. Having invited the ambaſſadors to an entertainment, during which he talked of their republic with more than his wonted reſpect, and teſtified the utmoſt ſolicitude for the ſucceſs of their negociation, he obſerved to them, that one circumſtance gave him much concern, their having mentioned *full powers*. They muſt beware of repeating that error in the aſſembly, becauſe the natural rapacity of the populace, appriſed of that circumſtance, would not fail to inſiſt on ſuch conditions as the honour of Sparta could not poſſibly comply with. When they appeared next day in the aſſembly, Alcibiades demanded, with a loud voice, the object and extent of their commiſſion. According to the concerted plan, they denied their having full powers. The artful Athenian, affecting a tranſport of indignation, arraigned the audacity and baſeneſs of a people by whom his own unſuſpecting temper had been egregiouſly abuſed. "But yeſterday they declared their full powers in the ſenate; they denied to-day what yeſterday they diſplayed with oſtentation. Such is the uſual duplicity of their republic. It is thus they have reſtored Amphipolis. It is thus, Athenians! they have reſtored the neighbouring towns in Macedon: it is thus they have, indeed, put you in poſſeſſion of Panactum, but with demoliſhed walls; and after concluding an alliance with Athens, ratified by ſolemn oath, moſt treacherouſly and daringly infringed it, by entering into a league with Thebes, your determined and inveterate enemy. Can you ſtill, men of Athens! tamely ſubmit to ſuch indignities? Do you not expel ſuch traitors (pointing to the ambaſſadors) from your preſence, and from your city?" This extraordinary harangue totally diſconcerted the Spartans. Had their confuſion allowed them to extenuate their fault by declaring the truth, the leaſt reflection muſt have ſuggeſted, that Alcibiades would repreſent their ſimple ſtory as a new turn of ingenious artifice. They retired abruptly from the aſſembly; Nicias, and the other partizans of Sparta, ſhared their diſgrace; and the Athenians were ſoon afterwards perſuaded by Alcibiades to embrace the Argive alliance.

The Peloponneſian war was now renewed with double inveteracy: the Spartans entruſted the command to Agis, their king, and all Lacedæmonians of the military age were ſummoned to the field. The dangerous expedient of arming the Helots was alſo adopted on this emergency. The Spartan allies ſhewed unuſual ardour in their cauſe. The Thebans ſent ten thouſand foot, and one thouſand horſemen: the Corinthians two thouſand heavy-armed men; the Megarians almoſt an equal number; the ancient cities of Pallenè and Sicyon in Achaia gave a powerful and ready aſſiſtance; while the ſmall but generous republic of Phlius, whoſe territory, bordering on Argolis, was appointed for the rendezvous of the confederates, took the field with the whole body of citizens and ſlaves capable of bearing arms.

The men of Argos obſerved the approaching ſtorm, and prepared to reſiſt it. The Eleans and Mantineans joined them; and, although the Athenians were long expected in vain, the Argives did not loſe courage, but boldly took the field to oppoſe the invaders. The ſkilful movements of king Agis intercepted their return to Argos; the high grounds above them were occupied by the Corinthians and Phliaſians; their retreat towards Nemea was cut off by the Bœotians and Megarians. A battle ſeemed inevitable in the winding vale of Argos; but it is eaſier to admire, than to explain, the ſubſequent conduct of either army. Whether the Argive commanders were diſconcerted by the judicious poſition of the enemy, or that compaſſion touched their minds on perceiving ſuch numerous bodies of men, chiefly natives of the ſame peninſula, ſprung from the ſame blood, and ſpeaking the ſame language, prepared to embrue their hands in kindred blood; or that, being ſecretly partizans of ariſtocracy, they were unwilling to come to extremities with Sparta; it is certain that, inſtead of joining battle, they entered into a conference with the Lacedæmonian king. In conſequence of this unexpected meaſure, a truce was concluded betwen the chiefs, without the concurrence or knowledge of the officers or troops in either army. The Argives, Thraſyllus and Alciphron, engaged that their countrymen ſhould give complete ſatisfaction for the injuries of which they were accuſed; and Agis, whoſe authority was abſolute in the field, led off the Spartan army. In the mean time Alcibiades was ſent on an embaſſy to Argos. His activity would not fail to promote the popular tumult, in which his own and the Athenian intereſt was concerned. Encouraged by him, the Argives, regardleſs of the truce, attacked the ancient and wealthy city of Orchomenus in Arcadia, which, after a feeble reſiſtance, ſubmitted to their arms; after which they proceeded to lay ſiege to the neighbouring town of Tegea.

The Lacedæmonians heard with indignation of the ſubmiſſion of Orchomenus, the ſiege of Tegea, and the open infraction of the treaty. They had formerly murmured againſt the imprudent or perfidious meaſures of king Agis; but, when they felt the effects of his miſconduct, their reſentment became outrageous. Yet his known talents for war recommended him again to the command of the army; and he aſſured his countrymen, that his future ſervices ſhould ſpeedily wipe off the ſtain from his character. The Spartans, however, firſt elected

elected on this occaſion ten counſellors to attend their kings in the field, to reſtrain their too precipitate reſolves, and control their too abſolute authority. Having taken this precaution, they ſummoned the aſſiſtance of their allies, whoſe ardour to renew hoſtilities was equal to their own. They proceeded with a numerous army to the town of Mantinæa, expecting either to take that place, or to oblige the enemy to defend it by withdrawing their troops from the ſiege of Tegea. The approach of the Argives prevented the ſurpriſe of Mantinæa; and both armies, whoſe ambition or reſentment had been ſo lately diſappointed of an opportunity to diſplay their valour or their fury, eagerly prepared for an engagement. The Spartans exhorted their followers, and each other, "to exert that innate valour which had ever animated their breaſts, and which could receive no additional force from a tedious diſplay of uſeleſs words." Thus ſaying, they marched into action with a ſlow and firm ſtep, regulated by the ſound of the flute, to meet the impetuous onſet of the Argives and Athenians. Above a thouſand of the former, choſen from the flower of the nobleſt youth of Argos, had been employed, ſince the firſt diſſenſions occaſioned by the peace of Nicias, in the conſtant exerciſe of arms, in order to maintain the honourable pretenſions of their country. They behaved with ſignal bravery. The Athenians were not wanting in the ſupport of their ancient fame. The Mantinæans ſtrenuouſly defended every thing moſt dear to them. But the allied army had been conſiderably weakened by the deſertion of the Eleans; and the martial enthuſiaſm of king Agis, ſeconded by the perſevering valour of the Spartans, decided the fortune of the battle. The Athenians and their allies were repulſed, broken, thrown into diſorder, and put to flight. The Spartans, unwilling to irritate their deſpair, did not continue the purſuit, but ſpeedily returned home to celebrate the Carnean feſtival, rejoicing in having reſtored the luſtre of their arms, and recovered their authority in the Peloponneſus. The battle of Mantinæa was fought in the year before Chriſt 418.

The Spartans had now a numerous party in Argos, who, emboldened by the victory of their friends, immediately took arms, aboliſhed the popular government, deſtroyed the partiſans of Athens, abjured the league with that ſtate, and entered into a new confederacy with Sparta. This event happened a few weeks after the engagement, and towards the cloſe of the fourteenth winter of the Peloponneſian war. During the two following years, Argos paid dearly for a moment of tranſient ſplendour, having undergone three bloody revolutions, which ended, as in Corcyra, in favour of the Athenians and democracy. The Athenians alſo reduced the rebellious city of Scionè, in the peninſula of Pallenè, againſt which their reſentment had been provoked to the utmoſt fury, becauſe the Scioneans, though inhabiting a country almoſt ſurrounded by the ſea, had defied the naval power of Athens, and, amidſt the misfortunes of that ſtate, revolted to her enemies. The citizens of Scionè became the victims of a revenge equally cruel and imprudent. The males, above the age of puberty, were put to the ſword; the women and children dragged into ſervitude; the name and honours of the city extinguiſhed for ever; and the territory planted with a new colony, conſiſting chiefly of Platæan exiles. A further and more cruel inſtance of the Peloponneſian war, was fatally experienced, in the year following, by the unfortunate iſland of Melos, one of the largeſt of the Cyclades, lying directly oppoſite to the Cape of Malea, the ſouthern promontory of Laconia. This beautiful iſland, ſixty miles in circumference, and bleſſed with the uſual productions of a fine climate, had early invited the colonization of the Spartans; and had enjoyed political independence for ſeven hundred years. The ſtrength and importance of the capital, which had the ſame name with the iſland, may be underſtood by the armament of thirty ſhips, and near three thouſand ſoldiers, which the Athenians brought againſt it. Before they commenced hoſtilities, either by attacking the city, or by ravaging the country, they ſent ambaſſadors to the Melians, in order to perſuade them to ſurrender, without incurring the danger or the puniſhment of an unequal, and probably a fruitleſs, reſiſtance. The iſlanders, however, true to the Spartan intereſt, refuſed to ſurrender; and the Athenians, irritated by oppoſition, inveſted, without delay, the capital of Melos, which was blocked up for ſeveral months by ſea and land. The beſieged, after ſuffering cruelly by famine, made ſeveral deſperate ſallies, ſeized the Athenian magazines, and deſtroyed part of their works. But towards the end of winter, their reſiſtance was defeated by the vigorous efforts of the enemy, combined with domeſtic treaſon. The males above the age of fourteen ſhared the unhappy fate of the Scioneans. The women and children were ſubjected to perpetual ſervitude, and five hundred new inhabitants, drawn from the neighbouring colonies of Athens, were ſent to occupy the vacant lands, which had been cultivated and adorned for ſeven centuries by the labour of the exterminated Melians.

Previous to the capture of Melos, the Grecian colonies in Sicily had experienced the diſorders of that tumultuous liberty, which had ſo long prevailed in the mother-country. Diſtracted by internal diſcord, and haraſſed by external hoſtility, they had neither leiſure nor inclination to attend to the politics of Greece. The republic of Syracuſe, which was alone capable of interpoſing with effect in the quarrels of that country, imitated, inſtead of oppoſing, the ambition of Athens. Moſt of the Dorian ſettlements had become tributaries to the Syracuſans; and towards the commencement of the Peloponneſian war, that aſpiring people, though torn by domeſtic factions, ſtrenuouſly exerted their valour againſt the Ionic ſettlements of Leontium, Catana, and Naxos. The active fermentation of popular aſſemblies had given the eloquence of a Gorgias to Leontium, and the abilities of an Hermocrates to Syracuſe. In the ſixth year of the Peloponneſian war, Gorgias came to Athens to ſolicit the protection of that republic againſt the unjuſt uſurpation of the Sicilian capital. His arguments convinced the judgment, and the brilliant harmony of his ſtyle tranſported the ſenſibility, of the Athenians. They immediately diſpatched twenty ſhips of war to the aſſiſtance of their Ionic brethren. Two years afterwards a ſimilar requeſt was made, and as readily complied with; and the Athenians ſeemed diſpoſed to engage with vigour in the war, when the foreſight of Hermocrates, alarmed by the intruſion of theſe ambitious ſtrangers, promoted a general peace among the ſtates of Sicily.

But within a few years after this event, war was renewed, Leontium was taken and deſtroyed, its inhabitants reduced to the condition of exiles, and its confederates, the Egeſtæans, cloſely beſieged by the arms of Syracuſe. The unfortunate communities again ſent an embaſſy to Athens, pleading the rights of conſanguinity, and addreſſing not only the paſſions but the intereſt of their powerful allies. This application had the deſired effect: the conqueſt of Syracuſe became a captivating object; and no prudential conſiderations were able to cool the ardour of the Athenian aſſembly, inflamed by the breath of the ambitious Alcibiades, whoſe waking and ſleeping dreams graſped at the wide extent of thoſe diſtant poſſeſſions, which were only to lead the way to the empire of the world. Allured by theſe extravagant proſpects of grandeur, the Athenians, in two ſucceſſive aſſemblies, held at the ſhort interval of five days, agreed to the reſolution of making war againſt Sicily, and of raiſing ſuch naval and military force as ſeemed neceſſary for carrying it on with vigour and ſucceſs.

While

While they ſtill deliberated on the latter object, the virtuous Nicias, who had been named with Alcibiades and Lamachus to the command of the projected armament, omitted nothing that prudence could ſuggeſt, to deter his countrymen from ſuch a dangerous experiment: but the utmoſt force of argument was in vain.

The magnitude of the preparations increaſed the hopes and the ardour of all ranks of men in the republic. The old expected that nothing could reſiſt ſuch a numerous and well-equipped armament. The young eagerly ſeized an occaſion to gratify their curioſity and love of knowledge in a diſtant navigation, and to ſhare the honours of ſuch a glorious enterpriſe. The rich exulted in diſplaying their magnificence; the poor rejoiced in the immediate aſſurance of pay ſufficient to relieve their preſent wants, and in the proſpect of obtaining by their arms the materials of future eaſe and happineſs. Inſtead of finding any difficulty to complete the levies, the great difficulty conſiſted in deciding the preference of valour and merit among thoſe who ſolicited to ſerve; and the whole complement of forces, to be employed by ſea and land, conſiſted of choſen men.

When the appointed day arrived, the whole inhabitants of Athens, whether citizens or ſtrangers, aſſembled early in the Piræus, to admire the greateſt ſpectacle ever beheld in a Grecian harbour. An hundred gallies were adorned with all the ſplendour of naval pomp: the troops deſtined to embark, vied with each other in the elegance of their dreſs and the brightneſs of their arms: the alacrity painted in every face, and the magnificence diſplayed with profuſion in every part of the equipage, repreſented a triumphal ſhow, rather than the ſtern image of war. Yet the ſolidity and greatneſs of the armament proved that it was intended for uſe, not for oſtentation. Amidſt this glare of external pageantry which accompanied the adventurous youth, their friends and kinſmen could not ſuppreſs a few parting tears, when they conſidered the length of the voyage, the dangers of the ſea, and the uncertainty of beholding again the deareſt pledges of their affections. But theſe partial expreſſions of grief were ſpeedily interrupted by the animating ſounds of the trumpet, which iſſued at once from an hundred ſhips, and provoked ſympathetic acclamations from the ſhore. The captains then offered ſolemn prayers to the gods, which were anſwered by correſponding vows from the ſpectators: the cuſtomary libations were poured out in gob lets of gold and ſilver; and, after the triumphant Pæan had been ſung in full chorus, the whole fleet at once ſet ſail, and contended for the prize of naval ſkill and celerity, until they reached the lofty ſhores of Ægina, from whence they enjoyed a proſperous navigation to the rendezvous of their confederates at Corcyra. The fleet conſiſted of an hundred and thirty-four ſhips of war, with a proportional number of tranſports and tenders. The heavy-armed troops, exceeding five thouſand, were attended with a ſufficient body of ſlingers and archers. The army, abundantly provided in every other article, was extremely deficient in horſes, which amounted to no more than thirty. But, at a moderate computation, we may eſtimate the whole military and naval ſtrength, including ſlaves and ſervants, at twenty thouſand men.

With this powerful hoſt, the Athenians arrived at Catana, which at firſt refuſed to admit the ſhips into the harbour, or the troops into the city. But on the reſpectful ſolicitation of Alcibiades, the Cataneans allowed him to addreſs the aſſembly, and propoſe his demands. The artful Athenian tranſported the populace, and even the magiſtrates themſelves, by the charms of his eloquence; the citizens flocked from every quarter, to hear a diſcourſe which was purpoſely protracted for ſeveral hours; the ſoldiers forſook their poſts; and the Athenians, who had prepared to avail themſelves of this negligence, burſt through the unguarded gates, and became maſters of the city. Thoſe of the Cataneans who were the moſt attached to the intereſts of Syracuſe, fortunately eſcaped death by flight. The reſt accepted the proffered friendſhip of the Athenians. This ſucceſs would probably have been followed by the ſurrender of Meſſenè, which Alcibiades had filled with diſtruſt and ſedition. But when the plot was ripe for execution, the man who had contrived, and who alone could conduct it, was diſqualified from ſerving his country. The arrival of the Salaminian galley recalled Alcibiades to Athens, that he might ſtand trial for his life.

It happened, that on the night preceding the intended navigation to Sicily, all the ſtatues of Mercury, which had been erected in the Athenian ſtreets, as the boundaries of different edifices and tenements, were thrown down, and defaced. One only image of the god, of uncommon ſize and beauty, was ſaved from the general wreck; it was afterwards called the ſtatue of Andocides, as it ſtood before the houſe of the Athenian orator of that name. This daring inſult was firſt aſcribed to the artifices of the Corinthians, who, it was ſuppoſed, might employ ſuch an abominable and ſacrilegious contrivance, to deter the Athenian armament from ſailing againſt their colony at Syracuſe. But the enemies of Alcibiades availed themſelves of the levity of his character, to direct the popular ſtorm againſt him. On the evidence of ſlaves, he was accuſed of having treated with rude familiarity other images of the gods; and Theſſalus, a degenerate ſon of the magnanimous Cimon, impeached him of impiety towards the goddeſſes Ceres and Proſerpine, whoſe awful ceremonies he had polluted and profaned.

Alcibiades defended himſelf, with his uſual eloquence and addreſs, againſt the malignity of a charge, unſupported by any adequate evidence. The ſoldiers and ſailors, whoſe eagerneſs already graſped the conqueſt of Sicily, interceded for the deliverance of their commander, whom they regarded as the ſoul of that glorious enterpriſe. A thouſand Argives and Mantinæans, who had enliſted, on this occaſion, under the Athenian banners, declared their unwillingneſs to ſail, unleſs they were accompanied by Alcibiades, whoſe valour and abilities alone had determined them to engage in ſuch an important but dangerous ſervice. This powerful combination in his favour diſappointed the preſent hopes, without diſconcerting the future meaſures, of his enemies. They perceived that, were he brought to an immediate trial, it would be impoſſible to obtain ſentence againſt him; but that, were his perſon and influence removed to a diſtance from Athens, every thing might be hoped from the weakneſs and credulity of the populace. It was therefore determined by this perfidious cabal, that ſuch orators as had hitherto diſguiſed, under the maſk of friendſhip or admiration, their envy and hatred of Alcibiades, ſhould declare in full aſſembly, that "it would be inconſiſtent with the cleareſt dictates of prudence and propriety, to involve in the tedious formalities of a judicial procedure a citizen who had been elected general by the unanimous ſuffrage of his country, and whoſe preſence was eagerly demanded by the affectionate ardour of his troops. The charges againſt him deſerved, doubtleſs, to be ſeriouſly examined; but the preſent was not a proper time for ſuch an inveſtigation, which muſt blunt the courage of his followers, and interrupt the ſervice of the republic. Let him ſail, therefore, for Sicily, and at his return home he will either vindicate his innocence, or ſuffer the puniſhment of his guilt." Alcibiades perceived the poiſon concealed under this affected lenity, and teſtified his reluctance to leave behind him ſuch abundant materials for the malice of informers. But his petition for an immediate trial was rejected by the aſſembly. He therefore ſet ſail, probably flattering

himſelf, that by the glory and ſucceſs of his arms, he ſhould ſilence the clamours, and defeat the machinations, of his accuſers.

Among the perſons who had been ſeized on ſuſpicion, were the crafty and intriguing Timæus, and the profligate and impious Andocides, the ſame whoſe ſtatue of Mercury had eſcaped the general mutilation. The known character of theſe men naturally marked them out as peculiar victims of popular fury. As they were confined in the ſame priſon, they had an opportunity of communicating their apprehenſions, and of contriving means of ſafety. Timæus perſuaded his friend, that it would be weakneſs to die by a falſe accuſation, when he might ſave himſelf by a lie. Andocides turned informer. The priſoners whom he named were baniſhed or put to death; the reſt were ſet at liberty. The abſent, among whom was Alcibiades, were recalled to ſtand trial. But they did not obey the ſummons ſent them by the Salaminian galley. The wanderings and misfortunes of more obſcure names are unknown: Alcibiades eſcaped to Thurium, and afterwards to Argos; and, when he underſtood that the Athenians had ſet a price on his head, he finally took refuge in Sparta; where his active genius ſeized the firſt opportunity to adviſe and to promote thoſe fatal meaſures, which, while they gratified his private reſentment, occaſioned the ruin of his country.

The removal of Alcibiades ſoon appeared in the languid operations of the Athenian armament. The cautious timidity of Nicias, ſupported by wealth, eloquence, and authority, gained an abſolute aſcendant over the more warlike and enterpriſing character of Lamachus, whoſe poverty expoſed him to contempt. Inſtead of making a bold impreſſion on Selinus or Syracuſe, Nicias contented himſelf with taking poſſeſſion of the inconſiderable colony of Hyccara; and of waſting the greateſt part of the ſummer in the inactive quarters of Naxos and Catana. He, however, determined to gratify the inclination of his troops, by the vigour of his winter campaign. The conqueſt of Syracuſe, againſt which he intended to lead them, might well excite the emulation of the combatants, ſince that powerful city formed the main obſtacle to their ambition, and the principal bulwark not only of Sicily, but of the Italian and African ſhores. Yet the dilatory operations of Nicias not only removed the terror and trepidation of the Syracuſans, but inſpired them with unuſual firmneſs. They requeſted their generals to lead them to Catana, that they might attack the hoſtile camp. Their cavalry haraſſed the Athenians by frequent incurſions, intercepted their convoys, deſtroyed their advanced poſts, and even proceeded ſo near to the main body, that they were diſtinctly heard demanding with loud inſults, Whether thoſe boaſted lords of Greece had left their native country, that they might form a precarious ſettlement at the foot of Mount Ætna?

Provoked by theſe indignities, and excited by the impatient reſentment of his own troops, Nicias was ſtill reſtrained from an open attempt againſt Syracuſe by the difficulties attending that enterpriſe. The diſtance between Catana and the Sicilian capital was more than thirty miles; but, after the moſt proſperous voyage, the Athenians could not expect, without extreme danger, to make a deſcent on the fortified coaſt of a powerful and vigilant enemy. If they determined to march by land, they muſt be haraſſed by the numerous cavalry of Syracuſe, which actually watched their motions, and with whoſe activity, in a broken and intricate country, the ſtrength of heavy-armed troops was exceedingly ill qualified to contend. To avoid both inconveniences, Nicias employed a ſtratagem. A citizen of Catana appeared in Syracuſe as a deſerter from his native city; the unhappy fate of which, in being ſubjected to the licentious diſorder of the Athenians, he lamented with perfidious tears, and with the plaintive accents of well-diſſembled ſorrow. "*He* was not the only man who bewailed, with filial compaſſion, the misfortunes and ignominy of his country. A numerous body of Cataneans, whoſe reſentment was repreſſed by fear, longed to take up arms, that they might repel the tyranny of the invaders. Nor could the deſign fail of ſucceſs, if Syracuſe ſhould ſecond their generous ardour. The Athenians, ſo liberally endowed with courage and ambition, were deſtitute of wiſdom and of diſcipline: their poſts were forſaken, their ſhips unguarded; they diſdained the duties of the camp, and indulged in the pleaſures of the city. On an appointed day it would be eaſy for the Syracuſans, aſſiſted by the conſpirators of Catana, to attack them unprepared, to demoliſh their encampment, and to burn their fleet." This daring propoſal well correſponded with the keen revenge which animated the inhabitants of Syracuſe. The day was named; the plan of the enterpriſe was concerted, and the treacherous Catanean returned home to revive the hopes of his pretended aſſociates.

The ſucceſs of this intrigue gave the utmoſt ſatisfaction to Nicias; and, after twelve hours ſail, the Athenian fleet arrived in the great harbour of Syracuſe, diſembarked their troops, and fortified a camp without the weſtern wall, near to the celebrated temple of Olympian Jupiter. Meanwhile the cavalry of Syracuſe, having proceeded to the walls of Catana, had diſcovered, to their infinite regret, the departure of the Athenians. The unwelcome intelligence was conveyed, with the utmoſt expedition, to the infantry, who immediately marched back to protect Syracuſe. The rapid return of the warlike youth reſtored the courage of the aged Syracuſans. They were joined by the forces of Gela, Selinus, and Camarina; and it was determined, without loſs of time, to attack the hoſtile encampment.

Only a few days elapſed before the Athenians gave them a fairer opportunity of revenge. The two armies prepared to engage, reſpectively inflamed by reſentment and ambition; the one formidable in courage and numbers, the other elated by ſuperior diſcipline and habitual victory. The Syracuſan generals drew up their troops ſixteen, and the Athenians only eight, deep: but the latter had, in their camp, a body of reſerve, which was kept ready for action on the firſt ſignal. Nicias led on his troops to the enemy, who did not decline the engagement. The light-armed archers ſkirmiſhed in the van: the prieſts brought forth the accuſtomed ſacrifices: the trumpets ſummoned for a general charge. The attack was begun with fury, and continued with perſeverance for ſeveral hours. Both ſides were animated by every principle that could inſpire the utmoſt vigour of exertion; and victory was ſtill doubtful, when a tempeſt ſuddenly aroſe, accompanied with unuſual peals of thunder. This event, which little affected the Athenians, confounded the unexperienced credulity of the enemy, who were broken and put to flight. Nicias reſtrained the eagerneſs of his men in the purſuit, leſt they ſhould be expoſed to danger from a body of twelve hundred Syracuſan cavalry, who had not engaged in the battle, but who impatiently watched an opportunity to aſſault the diſordered phalanx. The Syracuſans eſcaped to their city, and the Athenians returned their camp. In ſuch an obſtinate conflict the vanquiſhed loſt two hundred and ſixty, the victors only fifty, men. The voyage, the encampment, and the battle, employed the dangerous activity, and gratified the impetuous ardour, of the Athenians, but did not facilitate the conqueſt of Syracuſe. Without more powerful preparations, Nicias, deſpaired of taking the place, either by aſſault, or by a regular ſiege. Soon after his victory he returned with the whole armament to Naxos and Catana; a meaſure which ſufficiently proves that the late enterpriſe had been undertaken, not in conſequence of any permanent ſyſtem of operations formed by the general, but in compliance with the ungovernable temper

temper of his troops, whoſe ideas of military ſubordination were confined to the field of battle.

Meanwhile Nicias ſolicited and obtained freſh reinforcements from Athens. In addition to his original force, he had collected a body of ſix hundred cavalry, and the ſum of four hundred talents; and, in the eighteenth ſummer of the war, which was in the year before Chriſt 414, the activity of the troops and workmen had completed all neceſſary preparations for renewing the ſiege of Syracuſe. The Athenian armament enjoyed a proſperous voyage to the northern harbour of Trogilè, and the troops were no ſooner diſembarked than they ſeized an opportunity of ſignaliſing their valour againſt a body of ſeven hundred men, who marched to reinforce the garriſon of Labdalus, a fortreſs ſituate on the higheſt of the mountains which overlook the city. Three hundred Syracuſans were killed in the purſuit; the reſt took refuge behind their walls; and the caſtle of Labdalus was taken, and ſtrongly guarded by the victors. The plan which Nicias adopted for conquering the city, was to draw a wall on either ſide from the neighbourhood of Labdalus, towards the port of Trogilè on the north, and towards the gulph, called the Great Harbour, on the ſouth. When theſe circumvallations had ſurrounded the place by land, he expected, by his numerous fleet, to block up the wide extent of the Syracuſan harbours. The whole ſtrength of the Athenian armament was employed in the former operations; and, as all neceſſary materials had been provided with due attention, the works roſe with a rapidity which ſurpriſed and terrified the beſieged. Their former as well as their recent defeat deterred them from oppoſing the enemy in a general engagement; but the advice of Hermocrates perſuaded them to raiſe walls which might traverſe and interrupt thoſe of the Athenians. The imminent danger urged the activity of the workmen; the hoſtile bulwarks approached each other; frequent ſkirmiſhes took place, in one of which the brave Lamachus unfortunately fell a victim to his raſh valour; but the Athenian troops maintained their uſual ſuperiority, and the Syracuſans prepared to capitulate.

But, while the aſſembly were deliberating on the terms, Gongylus arrived from Carthage, announcing a ſpeedy and effectual relief to the beſieged city. He acquainted the Syracuſans that his countrymen had fitted out a conſiderable fleet, the arrival of which might be expected every hour. The Lacedæmonians alſo had ſent a ſmall ſquadron, and the whole armament was conducted by the Spartan Gylippus, an officer of tried valour and ability. While the deſponding citizens of Syracuſe liſtened to this intelligence with pleaſing aſtoniſhment, a meſſenger arrived by land from Gylippus himſelf. That experienced commander, inſtead of purſuing a direct courſe to Sicily, which might have been intercepted by the Athenian fleet, had landed on the weſtern coaſt of the iſland. The name of a Spartan general determined the wavering irreſolution of the Sicilians. The troops of Himera, Selinus, and Gela, flocked to his ſtandard; and he approached Syracuſe on the ſide of Epipolè, where the line of contravallation was ſtill unfiniſhed, with a body of ſeveral thouſand men. The moſt courageous of the citizens ſallied forth to meet their protector; their junction was effected; the ardour of the troops was kindled into enthuſiaſm; they ſurpriſed ſeveral Athenian poſts; and after a vigorous ſally, deprived the enemy of the ſtrong caſtle of Labdalus. Nicias, perceiving that the intereſt of the Athenians in Sicily would be continually weakened by delay, wiſhed to bring the fortune of the war to the deciſion of a battle. Nor did Gylippus decline the engagement. The firſt action was unfavourable to the Syracuſans, who had been imprudently poſted in the defiles between their own and the enemy's walls, which rendered of no avail their ſuperiority in cavalry and archers. The magnanimity of Gylippus acknowledged this error, for which he completely atoned by his judicious conduct in the ſucceeding engagement. His forces were drawn up in a more ſpacious ground. The pikemen received the ſhock of the enemy's front. The horſes and light-armed troops aſſailed and haraſſed their undefended flanks. The Athenians were thrown into diſorder, repulſed and purſued to their camp with conſiderable loſs, and with irreparable diſgrace.

Nicias, whoſe ſenſibility deeply felt the public diſtreſs, wrote a moſt deſponding letter to the Athenians. He honeſtly deſcribed, and lamented, the misfortunes and diſorders of his army. The ſlaves deſerted in great numbers; the mercenary troops, who fought only for pay and ſubſiſtence, preferred the more ſecure and lucrative ſervice of Syracuſe; even the Athenian citizens, diſguſted with the unexpected length and intolerable hardſhips of the war, abandoned the care of the gallies to unexperienced hands. He therefore exhorted the aſſembly, either to call them home without delay, or to ſend immediately a ſecond armament, more powerful than the firſt.

Gylippus and Hermocrates were well acquainted with the diſtreſs of the beſiegers, and therefore determined to preſs the enemy on every ſide, and at once to aſſail them by ſea and land. The principal ſquadrons of Syracuſe lay in the harbour of Ortygia, ſeparated, by an iſland of the ſame name, from the ſtation of the Athenian fleet. While Hermocrates ſailed forth with eighty gallies, to venture a naval engagement, Gylippus attacked the hoſtile fortifications at Plemmyrium, a promontory oppoſite to Ortygia, which confined the entrance of the Great Harbour. The defeat of the Syracuſans at ſea, whereby they loſt fourteen veſſels, was balanced by their victory at land, in which they took three fortreſſes, containing a large quantity of military and naval ſtores, and a conſiderable ſum of money. In ſome ſubſequent actions, which ſcarcely deſerve the name of battles, their fleet was ſtill unſucceſsful; but as they engaged with great caution, and found every where a ſecure retreat on a friendly ſhore, their loſs was extremely inconſiderable. The want of ſucceſs, in their firſt attempt, did not abate their reſolution to gain the command at ſea. The hopes of defending their country ſharpened their invention, and animated their activity. By unexampled aſſiduity, therefore, the Syracuſans at length prevailed in a naval engagement, which was fought in the Great Harbour. Seven Athenian ſhips were ſunk, many more were diſabled, and Nicias ſaved the remains of his ſhattered armament by retiring behind a line of merchantmen and tranſports, from the maſts of which had been ſuſpended huge maſſes of lead, ſufficient to cruſh, by their falling weight, the ſtouteſt gallies of antiquity. This unexpected obſtacle arreſted the progreſs of the victors; but the advantages already obtained elevated them with the higheſt hopes, and reduced the enemy to deſpair.

But the Athenians ſuſtained misfortunes at home ſtill more dreadful. Alcibiades, now an exile, took a decided part againſt his native city. He ſuggeſted to the Spartan king, that the town of Decelia was ſituated on the Attic frontier, at an equal diſtance of fifteen miles from Thebes and Athens. This place, which commanded an extenſive and fertile plain, might be ſurpriſed and fortified by the Spartans, who, inſtead of haraſſing their foes by annual excurſions, might thus infeſt them by a continual war. This advice was adopted in the commencement of the year 413 before Chriſt, and the warlike Agis led a powerful army into Attica. The defenceleſs inhabitants fled before his arms; but inſtead of purſuing them into the heart of the country, he ſtopped ſhort at Decelia. As all neceſſary materials had been provided in great abundance, the place was fortified as ſoon as it was taken; and now the walls of Decelia, which might be diſtinctly ſeen acroſs the intermediate plain,

plain, bade defiance to thoſe of Athens. Theſe domeſtic calamities did not, however, prevent the moſt vigorous exertions abroad. Twenty gallies, ſtationed at Naupactus, watched the motions of the Peloponneſian fleet deſtined to the aſſiſtance of Syracuſe: thirty carried on the war in Macedonia, to reduce the rebellion of Amphipolis; a conſiderable ſquadron collected tribute, and levied ſoldiers, in the colonies of Aſia; another, ſtill more powerful, ravaged the coaſt of Peloponneſus. Never did any kingdom or republic equal the magnanimity of Athens; never, in ancient or modern times, did the courage of any ſtate entertain an ambition ſo far ſuperior to its power, or exert efforts ſo diſproportionate to its ſtrength. Amidſt the difficulties and dangers which encompaſſed them on every ſide, the Athenians perſiſted in the ſiege of Syracuſe, a city little inferior to their own; and, undaunted by the actual devaſtation of their country, unterrified by the menaced aſſault of their walls, they ſent, without delay, ſuch a reinforcement into Sicily, as afforded the moſt promiſing hopes of ſucceſs to Nicias.

The Syracuſans had ſcarcely time to rejoice at their victory, when a numerous and formidable armament appeared on the Sicilian coaſt. The Syracuſans employed not unavailing efforts to check the progreſs, or to hinder the approach, of the hoſtile armament; which, beſides innumerable foreign veſſels and tranſports, conſiſted of ſeventy-three Athenian gallies, commanded by the experienced valour of Demoſthenes and Eurymedon. The pikemen on-board exceeded five thouſand; the light-armed troops were nearly as numerous; and, including the rowers, workmen, and attendants, the whole amounted to above twenty thouſand men. The misfortunes hitherto attending the operations in Sicily had lowered the character of Nicias; and this circumſtance, as well as the ſuperior abilities of Demoſthenes, entitled him to aſſume the principal authority in their deliberations. His advice, which Eurymedon highly approved, was clear and ſimple. "They ought to avail themſelves of the alarm which the unexpected arrival of ſuch a powerful reinforcement had ſpread among the enemy; and inſtead of ſubmitting to the tedious formalities of a ſiege, at once aſſault the walls of Syracuſe. He truſted, by the valour of his troops, to obtain in one day the valuable reward of long and ſevere labours. But if the gods had otherwiſe determined, it would be time to deſiſt from an enterpriſe, in which delay was equal to defeat, and to employ the bravery of the Athenian youth in repelling the invaders of their country."

Demoſthenes choſe the firſt hour of a moonſhine night, to proceed with the flower of the army to ſeize the fortreſſes in Epipolè. The march was performed with ſucceſsful celerity; the outpoſts were ſurpriſed; the guards put to the ſword; and three ſeparate encampments, of the Syracuſans, the Sicilians, and allies, formed a feeble oppoſition to the Athenian ardour. Meanwhile, the vigilant activity of Gylippus had aſſembled the whole force of Syracuſe. At the approach of the enemy his vanguard retired. The Athenians were decoyed within the intricate windings of the walls, and their irregular fury was firſt checked by the firmneſs of a Theban phalanx. A reſiſtance ſo ſudden and unexpected might alone have been deciſive; but other circumſtances were adverſe to the Athenians: their foremoſt ranks were repelled; and, as they retreated to the main body, encountered the advancing Argives and Corcyreans, who ſinging the Pœan in their Doric dialect and accent, were unfortunately taken for enemies. Fear, and then rage, ſeized the Athenians, who, thinking themſelves encompaſſed on all ſides, determined to force their way, and committed much bloodſhed among their allies, before the miſtake could be diſcovered. To prevent the repetition of this dreadful error, their ſcattered bands were obliged at every moment to demand the watch-word, which was at length betrayed to their adverſaries. The conſequence of this was doubly fatal. At every rencounter the ſilent Athenians were ſlaughtered without mercy, while the enemy, who knew their watch-word, might at pleaſure join or decline the battle, and eaſily oppreſs their weakneſs, or elude their ſtrength. The terror and confuſion increaſed; the rout became general. Gylippus purſued in good order with his victorious troops. Several thouſands were left dead or wounded on the ſcene of action; and in the morning the greater part of the ſtragglers were intercepted and cut off by the Syracuſan cavalry.

This unexpected diſaſter ſuſpended the operations of the ſiege. The Athenian generals ſpent the time in fruitleſs deliberations concerning their future meaſures; and while the army lay encamped on the marſhy and unhealthy banks of the Anapus, a general ſickneſs broke out in the camp. Demoſthenes urged this calamity as a new reaſon for haſtening their departure, while it was yet poſſible to croſs the Ionian ſea, without riſking the danger of a winter's tempeſt. But Nicias diſſuaded the deſign of leaving Sicily, until they ſhould be warranted to take this important ſtep by the poſitive authority of the republic. The colleagues of Nicias were confounded with the firmneſs of an oppoſition ſo unlike the flexible timidity of his ordinary character, and ſo inconſiſtent with the ſentiments which he had often expreſſed concerning the Sicilian expedition. They imagined that he might rely on ſome more important ground of confidence, which his caution was unwilling to explain; they ſubmitted therefore to his opinion, an opinion equally fatal to himſelf and to them, and to the armament which they commanded.

Gylippus, in order to follow up his victory, drew a powerful reinforcement from the Sicilian cities; and the tranſports, ſo long expected from Peloponneſus, now arrived in the harbour of Ortygia. Theſe powerful auxiliaries increaſed their eagerneſs to attack the enemy again by ſea and land. During three days there was a perpetual ſucceſſion of military and naval exploits. On the firſt day fortune hung in ſuſpenſe; the ſecond deprived the Athenians of a conſiderable ſquadron commanded by Eurymedon; and this misfortune was embittered, on the third, by the loſs of eighteen gallies, with their crews. It was now reſolved by Hermocrates to throw a chain of veſſels acroſs the mouth of the Great Harbour, about a mile in breadth. This point was accompliſhed before Nicias, totally occupied by other objects, attempted to interrupt it. The Athenian gallies were refitted, and again prepared, to the number of a hundred and ten, to riſk the event of another battle. As they had ſuffered greatly, on former occaſions, by the ſolidity of the Syracuſan prows, Nicias provided them with grappling-irons, fitted to prevent the recoil of their oppoſents, and the repetition of the hoſtile ſtroke. The decks were crowded with armed men, and the contrivance to which the enemy had hitherto chiefly owed their ſucceſs, of introducing the firmneſs and ſtability of a military into a naval engagement, was adopted in turn by the Athenians. When the fleet was ready, Nicias recalled the troops from the various poſts ſtill occupied by their arms, and formed them into one camp on the ſhore, where, on the day of battle, their ranks might be extended as widely as the vicinity of the Syracuſan ramparts could ſafely permit; that a ſpacious retreat might be ſecured to the Athenian ſhips, if perſecuted by their uſual bad fortune; in which fatal alternative, nothing remained but to retire by land with the miſerable remnant of the army.

With a cheerful and magnanimous firmneſs, he removed the dejection of the Athenians, exhorting them, before they embarked, to call forth every exertion of ſkill and courage on this important occaſion. When the Syracuſans were appriſed of the deſigns of the enemy, they haſtened to the defence of the bar which had been thrown acroſs the entrance of the harbour. Gylippus, after

after animating the ſailors to deeds of valour, returned to take the conduct of the land forces, leaving Sicanus, Agatharcus, and Pythen, the two firſt to command the wings, and the laſt, a citizen of Corinth, to command the centre, of the Syracuſan fleet, which fell ſhort of the Athenian by the number of twenty gallies.

Nicias, after again cheering his wearied troops, returned to the camp with an enfeebled body and an anxious mind, committing the laſt hope of the republic to the active valour of Demoſthenes, Eudemus, and Menander. The firſt impreſſion of the Athenians was irreſiſtible; they burſt through the paſſage of the bar, and repelled the ſquadrons on either ſide. As the entrance widened, the Syracuſans, in their turn, ruſhed into the harbour, which was more favourable than the open ſea to their mode of fighting. Thither the foremoſt of the Athenians returned, either compelled by ſuperior force, or that they might aſſiſt their companions. The engagement became general in the harbour's mouth; and in this narrow ſpace two hundred gallies fought, during the greateſt part of the day, with an obſtinate and perſevering valour. The battle was not long confined to the ſhock of adverſe prows, and to the diſtant hoſtility of darts and arrows. The neareſt veſſels grappled, and cloſed with each other, and their decks were ſoon covered with blood. While the heavy-armed troops boarded the enemy's ſhips, they left their own expoſed to a ſimilar misfortune; the fleets were divided into maſſive cluſters of adhering gallies; and the confuſion of their mingled ſhouts overpowered the voice of authority; the Athenians exhorting, not to abandon an element on which their republic had ever acquired victory and glory, for the dangerous protection of an hoſtile ſhore; and the Syracuſans encouraging each other not to fly from an enemy, whoſe weakneſs or cowardice had long meditated flight.

The ſingular and tremendous ſpectacle of an engagement more fierce and obſtinate than any that had ever been beheld in the Grecian ſeas, reſtrained the activity, and totally ſuſpended the powers, of the numerous and adverſe battalions which encircled the coaſt. The ſpectators and the actors were equally intereſted in the important ſcene; but the former, the current of whoſe ſenſibility was undiverted by any exertion of mind or body, felt more deeply, and expreſſed more forcibly, the various emotions by which they were agitated. Hope, fear, the ſhouts of victory, the ſhrieks of deſpair, the anxious ſolicitude of doubtful ſucceſs, animated the countenances, the voice, and the geſture, of the Athenians, whoſe whole reliance centered in their fleet. When at length their gallies evidently gave way on every ſide, the contraſt of alternate, and the rapid tumult of ſucceſſive, paſſions, ſubſided in a melancholy calm. This dreadful pauſe of aſtoniſhment and terror was followed by the diſordered trepidation of flight and fear: many eſcaped to the camp: others ran, uncertain whither to direct their ſteps: while Nicias, with a ſmall but undiſmayed band, remained on ſhore, to protect the landing of their unfortunate gallies. In this well-fought battle, the vanquiſhed had loſt fifty, and the victors forty, veſſels.

On the third morning after the battle, the Athenians broke up their camp. Forty thouſand men, of whom many were afflicted with wounds and diſeaſe, and all exhauſted by fatigue, and dejected by calamity, exhibited the appearance, not of a flying army, but of a great and populous community, driven from their ancient habitations by the cruel vengeance of a conqueror. Inſtead of leading the army towards Naxos and Catana, in which direction there was reaſon to apprehend many ſecret ambuſhes of the enemy, he conducted them by the weſtern route towards Gela and Camerina; expecting, by this meaſure, to find proviſions in greater plenty, as well as to elude the ſnares of the Syracuſans. The troops were then divided into two ſquares, as the moſt ſecure and capacious arrangement. Nicias led the van; Demoſthenes conducted the rear; the baggage, and unarmed multitude, occupied the centre. In this order of march they paſſed the river Anapus, the ford of which was feebly diſputed by an inconſiderable guard; and having proceeded the firſt day only five miles, they encamped in the evening on a riſing ground, after being much haraſſed during the latter part of their journey by the Syracuſan cavalry and archers, who galled them at a diſtance, intercepted the ſtragglers, and avoided, by a ſeaſonable retreat, to commit the ſecurity of their own fortune with the dangerous deſpair of the Athenians. Next day, having marched only twenty furlongs, they reached a ſpacious plain, the convenience of which invited them to repoſe; eſpecially as they needed a ſupply of water and proviſions, which might be eaſily obtained from the ſurrounding country.

Before this time, the enemy were appriſed of their line of march; and, in order to interrupt it, they ſent a numerous detachment to fortify the mountain of Acræum. It was diſtant only a few miles from the Athenian encampment. In vain the Athenians attempted, on three ſucceſſive days, to force the paſſage. They were repelled with loſs in every new attack, which became more feeble than the preceding. In the evening after the laſt unſucceſsful conteſt, the condition of the Athenians was peculiarly deplorable. The numbers of the wounded had been increaſed by theſe fruitleſs attempts to paſs the mountain; the adjacent territory could no longer ſupply them with the neceſſaries of life; and they muſt be compelled, after all their hardſhips and fatigues, to make a long circuit by the ſea-ſhore, if they expected to reach, in ſafety, the places of their reſpective deſtination. Even this reſolution, (for there was no alternative,) was recommended by Nicias, who, to conceal his deſign from the enemy, cauſed innumerable fires to be lighted in every part of the camp. The troops then marched out under cover of the night, and in the ſame order which they had hitherto obſerved. But they had not proceeded far in this nocturnal expedition, when the obſcurity of the ſkies, the deceitful tracks of an unknown and hoſtile country, filled the timid or unfortunate with imaginary terrors. Their panic was ſpeedily communicated to thoſe around them; and Demoſthenes, with above one-half of his diviſion, fatally miſtook the road, and quitted, never more to rejoin, the reſt of the army.

The ſcouts of Gylippus immediately brought intelligence of this important event, which furniſhed an opportunity to attack the divided ſtrength of the Athenians. His ſuperior knowledge of the country enabled him, by the celerity of his march, to intercept the ſmaller diviſion, and to ſurround them on every ſide, in the difficult and intricate defiles which led to the ford of the Erinios. There he aſſaulted them with impunity, during a whole day, with darts, arrows, and javelins. When the meaſure of their ſufferings was complete, he proclaimed towards the evening, by the ſound of the trumpet, and with the loud voice of the herald, freedom, forgiveneſs, and protection, to all who ſhould deſert and abandon the bad fortune of their leaders; an offer which was accepted by the troops of ſeveral Aſiatic iſlands, and other dependent and tributary countries. At length he entered into a treaty with Demoſthenes, whoſe ſoldiers laid down their arms, and delivered their money, on condition that they ſhould not ſuffer death, impriſonment, or famine. Notwithſtanding the number of the deſerters and of the ſlain, the remainder ſtill amounted to ſix thouſand, who were ſent to Syracuſe with their captive general, under a powerful and vigilant eſcort, while the activity of Gylippus followed the flying battalions of the enemy, which had been conducted by Nicias to the diſtance of twenty miles, towards the banks of the Aſſinaros. The Syracuſans overtook the rear before the van could arrive at the

lofty

lofty margin of this rapid ſtream; and a herald was ſent to Nicias, exhorting him to imitate the example of his colleague, and to ſurrender, without farther bloodſhed, to the irreſiſtible valour of his victorious purſuers. Nicias diſbelieved, or affected to diſbelieve, the report; but when a confidential meſſenger, whom he was allowed to diſpatch for information, brought certain intelligence of the ſurrender and diſgrace of Demoſthenes, he alſo condeſcended to propoſe terms, in the name of the Athenians, engaging, on the immediate ceſſation of hoſtilities, to reimburſe the magiſtrates of Syracuſe for the expence of the war, and to deliver Athenian hoſtages until the debt ſhould be liquidated.

Theſe terms were rejected by the Syracuſans with diſdain; and Gylippus, having occupied the moſt advantageous poſts on every ſide, attacked the army of Nicias with the ſame mode of warfare, which, two days before, had proved ſo deſtructive to their unfortunate companions. During the whole day they bore, with extraordinary patience, the hoſtile aſſault, ſtill expecting, under cover of the night, to eſcape the cruel vigilance of the enemy. But that hope was vain: Gylippus perceived their departure; and although three hundred men of determined courage gallantly broke through the guards, and effected their eſcape, the reſt were no ſooner diſcovered than they returned to their former ſtation. Yet the return of the morning brought back their courage. They marched towards the river, miſerably galled by the hoſtile archers and cavalry. Their diſtreſs was moſt lamentable and incurable: yet hope did not totally forſake them; they ſtill entertained an idea that their ſufferings would end, could they but reach the oppoſite banks of the neighbouring river. The deſire of aſſuaging their thirſt encouraged this bold deſign. They ruſhed into the rapidity of the ſtream; the purſuing Syracuſans, who had occupied the rocky banks, deſtroying them with innumerable volleys of miſſile weapons. In the Aſſinaros, many were borne down the ſtream. At length the weight of their numbers reſiſted the violence of the torrent; but a new horror preſented itſelf to the eyes of Nicias. His ſoldiers turned their fury againſt each other, diſputing, with the point of the ſword, the unwholeſome draughts of the turbid current. This ſpectacle melted the firmneſs of his ſoul. He ſurrendered to Gylippus, and aſked quarter for the miſerable remnant of his troops. Before the commands of the Lacedæmonian general could pervade the army, many of the ſoldiers had, according to the barbarous practice of the age, ſeized their priſoners and ſlaves; ſo that the Athenian captives were afterwards diſtributed among ſeveral communities of Sicily. The reſt, upon laying down their arms, were entitled to the protection of Gylippus; who, after ſending proper detachments to intercept and collect the ſtragglers, returned in triumph to Syracuſe, with the unfading trophies of his valour and conduct.

Nicias had little to expect from the humanity of a proud and victorious Spartan; but Demoſthenes might naturally flatter himſelf with the hope of juſtice. He urged with energy, but urged in vain, the obſervance of the capitulation which had been ratified in due form, on the faith of which he had ſurrendered himſelf and the troops entruſted to his command. The public priſoners, conducted ſucceſſively to Syracuſe, and exceeding together the number of ſeven thouſand, were treated with the ſame inhuman cruelty. They were univerſally condemned to labour in the mines and quarries of Sicily: their whole ſuſtenance was bread and water: they ſuffered alternately the ardours of a ſcorching ſun, and the chilling damps of autumn. For ſeventy days and nights they languiſhed in this dreadful captivity, during which, the diſeaſes incident to their manner of life were rendered infectious by the ſtench of the dead bodies, which corrupted the purity of the ſurrounding air. At length an eternal ſeparation was made between thoſe who ſhould enjoy the happier lot of being ſold as ſlaves into diſtant lands, and thoſe who ſhould for ever be confined to their terrible dungeons. The Athenians, with ſuch Italians and Sicilians as had embraced their cauſe, were reſerved for the latter doom. Their generals, Nicias and Demoſthenes, had not lived to behold this melancholy hour. Gylippus would have ſpared their lives, not from any motives of humanity and eſteem, but that his joyous return to Sparta might have been graced by their preſence. But the reſentment of the Syracuſans loudly demanded the immediate execution of the captive generals. The Athenian ſtate juſtly regretted the loſs of Demoſthenes, a gallant and enterpriſing commander; but poſterity will for ever lament the fate of Nicias, the moſt pious, the moſt virtuous, and the moſt unfortunate, man of the age in which he lived.

Amidſt this dreadful ſcene of cruelty, we muſt not omit to mention one ſingular example of humanity, which broke forth like a meteor in the gloom of a nocturnal tempeſt. The Syracuſans, who could puniſh their helpleſs captives with ſuch unrelenting ſeverity, had often melted at the affecting ſtrains of Euripides, an Athenian poet, who was regarded as the moſt tender and pathetic of all the tragic writers. The pleaſure which the Syracuſans had derived from his inimitable poetry, made them long to hear it rehearſed by the flexible voices and harmonious pronunciation of the Athenians, ſo unlike, and ſo ſuperior, to the rudeneſs of their own Doric dialect. They deſired their captives to repeat the plaintive ſcenes of their favourite bard. The captives obeyed; and affecting to repreſent the woes of ancient kings and heroes, moſt faithfully expreſſed their own. Their taſte and ſenſibility endeared them to the Syracuſans, who releaſed their bonds, received them with kindneſs into their families, and, after treating them with all the honourable diſtinctions of ancient hoſpitality, reſtored them to their afflicted country, as a ſmall but precious wreck of the moſt formidable armament that had ever ſailed from a Grecian harbour. At their return to Athens, the grateful captives walked in ſolemn proceſſion to the houſe of Euripides, whom they hailed and thanked as their deliverer from ſlavery and death.

The diſtreſs of the Athenian nation was too great to admit the comfort of ſympathy; yet with one mind and reſolution they determined to brave the ſeverity of fortune, and to withſtand the aſſaults of their enemies. In the year following the unfortunate expedition into Sicily, the Spartans prepared a fleet of an hundred ſail, deſtined to tempt and encourage the revolt of the Aſiatic ſubjects of the Athenians. The iſlands of Chios and Leſbos, as well as the city of Erythræ, at once ſolicited the Spartans to join them with their naval force. Their requeſt was enforced by the Perſian general Tiſſaphernes, who promiſed to pay the ſailors, and to victual the ſhips. At the ſame time, an ambaſſador from Cyzicus, entreated the Lacedæmonian armament to ſail to the capacious harbours which had long formed the wealth of that city, and to expel the Athenian garriſons, to whom the Cyzicenes and their neighbours reluctantly ſubmitted. The Perſian general Pharnabazus ſeconded their propoſal; offered the ſame conditions with Tiſſaphernes; and ſo little harmony ſubſiſted between the two lieutenants of the great king, that each urged his particular demand with a total unconcern about the important intereſts of their common maſter. The Lacedæmonians held many conſultations among themſelves, and with their allies; heſitated, deliberated, reſolved, and changed their reſolution; and at length were perſuaded by Alcibiades to prefer the overture of Tiſſaphernes and the Ionians, to that of the Helleſpontines and Pharnabazus.

The delay occaſioned by this deliberation was the principal, but not the only, cauſe which hindered the allies from acting expeditiouſly, at a time when expedi-

tion was of the utmoſt importance. A variety of private views diverted them from the general aim of the confederacy; and the ſeaſon was far advanced before the Corinthians, who had been diſtinguiſhed by exceſs of antipathy to Athens, were prepared to ſail. They determined, from pride perhaps, as well as ſuperſtition, to celebrate, before leaving their harbours, the Iſthmian games conſecrated to Neptune, the third of the Grecian feſtivals in point of dignity and ſplendour. From this ceremony the Athenians, though enemies, were not excluded by the Corinthian magiſtrates; nor did they exclude themſelves, though oppreſſed by the weight of paſt misfortunes, and totally occupied by the thoughts of providing againſt future evils. While their repreſentatives ſhared the amuſements of this ſacred ſpectacle, they neglected not the commiſſion recommended by their country. They ſecretly informed themſelves of the plan and particular circumſtances of the intended revolt, and learned the preciſe time fixed for the departure of the Corinthian fleet. In conſequence of this important intelligence, the Athenians anticipated the deſigns of the rebels of Chios, and carried off ſeven ſhips as pledges of their fidelity. The ſquadron which returned from this uſeful enterpriſe, intercepted the Corinthians as they ſailed through the Saronic gulph; and having attacked and conquered them, purſued and blocked them up in their harbours.

Meanwhile the Spartans and their allies ſent to the Ionian coaſt ſuch ſquadrons as were ſucceſſively ready for ſea, under the conduct of Alcibiades, Chalcideus, and Aſtyochus. The firſt of theſe commanders ſailed to the iſle of Chios, which was diſtracted by contending factions. The Athenian partiſans were ſurpriſed, and compelled to ſubmit; and the city, which poſſeſſed forty gallies, and yielded in wealth and populouſneſs to none of the neighbouring colonies, became an acceſſion to the Peloponneſian confederacy. The ſtrong and rich town of Miletus followed the example: Erythræ and Clazomenè ſurrendered to Chalcideus; ſeveral places of leſs note were conquered by Aſtyochus.

When the Athenians received the unwelcome intelligence of theſe events, they voted the expenditure of a thouſand talents, which, in more proſperous times, they had depoſited in the citadel, under the ſanction of a decree of the ſenate and people, to reſerve it for an occaſion of the utmoſt danger. This ſeaſonable ſupply enabled them to increaſe the fleet, which ſailed, under Phrynichus and other leaders, to the iſle of Leſbos. Having ſecured the fidelity of the Leſbians, who were ripe for rebellion, they endeavoured to recover their authority in Miletus, anciently regarded as the capital of the Ionic coaſt. A bloody battle was fought before the walls of that place, between the Athenians and Argives on one ſide; and the Peloponneſians, aſſiſted by the troops of Tiſſaphernes and the revolted Mileſians, on the other. The Athenian bravery defeated, on this occaſion, the ſuperior numbers of Greeks and barbarians to whom they were oppoſed; but their Argive auxiliaries were repulſed by the gallant citizens of Miletus: ſo that, in both parts of the engagement, the Ionic race, commonly called the leſs warlike, prevailed over their Dorian rivals and enemies. Elevated with the joy of victory, the Athenians prepared to aſſault the town, when they were alarmed by the approach of a fleet of fifty-five ſail, which advanced in two diviſions, the one commanded by the celebrated Hermocrates from Syracuſe, the other by Theramenes the Spartan. Phrynichus prudently conſidered, that his own ſtrength only amounted to forty-eight gallies, and refuſed to commit the laſt hope of the republic to the danger of an unequal combat; and he calmly retired with his whole force to the iſle of Samos.

The retreat of the Athenian fleet acknowledged the naval ſuperiority of the enemy; a ſuperiority which was alone ſufficient either to acquire or to maintain the ſubmiſſion of the neighbouring coaſts and iſlands. In other reſpects too, the Peloponneſians enjoyed the moſt deciſive advantages. Their gallies were victualled, their ſoldiers were paid, by Tiſſaphernes, and they daily expected a reinforcement of a hundred and fifty Phœnician ſhips, which, it was ſaid, had already reached Aſpendus, a ſea-port of Pamphylia. But in this dangerous criſis, fortune ſeemed to reſpect the declining age of Athens, and, by a train of accidents, ſingular and almoſt incredible, enabled Alcibiades, ſo long the misfortune and the ſcourge, to become, for a time, the preſerver, of his country. During his reſidence in Sparta, he aſſumed the outward gravity of deportment, and conformed himſelf to the ſpare diet, and laborious exerciſes, which prevailed in that auſtere republic; but his character and his principles remained as licentious as ever. His intrigue with Timea, the conſort of king Agis, was diſcovered by an exceſs of female levity. The queen, vain of the attachment of ſo celebrated a character, familiarly gave the name of Alcibiades to her ſon Leotychides; a name which, firſt confined to the privacy of her female companions, was ſoon ſpread abroad in the world. Alcibiades puniſhed her folly by a moſt mortifying but well-merited declaration, boaſting that he had ſolicited her favours from no other motive but that he might indulge the ambitious deſire of giving a king to Sparta. The offence itſelf, and the ſhameleſs avowal, more provoking, if poſſible, than the offence, excited the keeneſt reſentment in the breaſt of the injured huſband; and orders were ſent to Aſtyochus, who commanded the Peloponneſian forces in Aſia, ſecretly to deſtroy Alcibiades, who defied thoſe laws which in every Grecian republic condemned adulterers to death. But the ſubtle Athenian had gained intelligence of this execrable deſign.

Baniſhed from Athens, perſecuted by Sparta, and in danger of aſſaſſination, he had recourſe to the friendſhip of Tiſſaphernes, who admired his accompliſhments, and reſpected his abilities. Alcibiades, therefore, began to flatter his avarice, that he might enſure his protection; and by ſowing the ſeeds of diſcord between Tiſſaphernes and the Peloponneſians, he hoped to pave the way to return to his country: with this view he applied ſecretly to Piſander, Theramenes, and other perſons of diſtinction in the Athenian camp. To them he deplored the deſperate ſtate of public affairs, expatiated on his own credit with Tiſſaphernes, and inſinuated that it might be yet poſſible to prevent the Phœnician fleet at Aſpendus from ſailing to aſſiſt the enemy. Aſſuming gradually more boldneſs as he perceived the ſucceſs of his intrigues, he finally declared that the Athenians might obtain not merely the neutrality, but perhaps the aſſiſtance, of Artaxerxes, ſhould they conſent to aboliſh their turbulent democracy, ſo odious to the Perſians, and entruſt the adminiſtration of government to men worthy to negociate with ſo mighty a monarch.

When the illuſtrious exile propoſed this meaſure, it is uncertain whether he was acquainted with the ſecret cabals which had been already formed, both in the city and in the camp, for executing the deſign which he ſuggeſted. Many prompted by ambition, ſeveral moved by inconſtancy, a few directed by a juſt ſenſe of the incurable defects of democracy, were prepared to encounter every danger, that they might overturn the eſtabliſhed conſtitution. In the third and moſt honourable claſs was Antiphon, a man of an exalted character, and endowed with extraordinary talents. The irreſiſtible energy of his eloquence was ſuſpected by the people. He appeared not in the courts of juſtice, or in the aſſembly; but his artful and elaborate compoſitions often ſaved the lives of his friends. He was the inviſible agent who governed all the motions of the conſpiracy; and when compelled, after the ruin of his party, to ſtand trial for his life, he diſcovered an activity and force of mind that aſtoniſhed the moſt diſcerning of his contemporaries.

poraries. Pifander, Theramenes, and the other leaders of the ariſtocratical party, warmly approved the views of Alcibiades. The Athenian ſoldiers likewiſe, though they deteſted the impiety, admired the valour, of the illuſtrious exile, and longed to ſee him reſtored to the ſervice of his country. Phrynichus, the perſonal enemy of Alcibiades, alone oppoſed the general current. When he perceived that his colleagues were deaf to every objection againſt recalling the friend of Tiſſaphernes, he ſecretly informed the Spartan admiral Aſtyochus, of the intrigues which were carrying on to the diſadvantage of his country. Daring as this treachery was, Phrynichus addreſſed a traitor not leſs perfidious than himſelf. Aſtyochus was become the penſioner and creature of Tiſſaphernes, to whom he communicated the intelligence. The Perſian again communicated it to his favourite Alcibiades, who complained in ſtrong terms to the Athenians of the baſeneſs and villany of Phrynichus. The latter exculpated himſelf with conſummate addreſs; but as the return of Alcibiades might prove fatal to his ſafety, he ventured, a ſecond time, to write to Aſtyochus, reproaching him with his breach of confidence, and explaining by what means he might ſurpriſe the whole Athenian fleet at Samos; an exploit that muſt for ever eſtabliſh his fame and fortune. Aſtyochus again betrayed the ſecret to Tiſſaphernes and Alcibiades; but before their letters could be conveyed to the Athenian camp, Phrynichus, who by ſome unknown channel was informed of this ſecond treachery, anticipated the dangerous diſcovery, by appriſing the Athenians of the enemy's deſign to ſurpriſe their fleet. They had ſcarcely employed the proper means to counteract that purpoſe, when meſſengers came from Alcibiades to announce the horrid perfidy of a wretch who had baſely ſacrificed to private reſentment the laſt hope of his country. But the meſſengers arrived too late; the prior information of Phrynichus, as well as the bold and ſingular wickedneſs of his deſign, which no common degree of evidence was thought ſufficient to prove, were ſuſtained as arguments for his exculpation; and it was believed that Alcibiades had made uſe of a ſtratagem moſt infamous in itſelf, but not unexampled among the Greeks, for deſtroying a man whom he deteſted.

The oppoſition of Phrynichus, though it retarded the deſigns of Alcibiades, prevented not the meaſures of Piſander and his aſſociates for aboliſhing the democracy. The ſoldiers at Samos were induced to acquieſce in the reſolution of their generals; and Piſander headed the deputation which was ſent from the camp to the city to effect this important revolution. He acquainted the extraordinary aſſembly, ſummoned on that occaſion, with the meaſures which had been adopted by their ſoldiers and fellow-citizens at Samos; but loud murmurs of diſcontent reſounded in different parts of the aſſembly. Piſander aſked the reaſon of this diſapprobation. "Had his opponents any thing better to propoſe? If they had, let them come forward and explain the grounds of their diſſent: but, above all, let them explain how they could ſave themſelves, their families, and their country, unleſs they complied with the demand of Tiſſaphernes. The imperious voice of neceſſity was ſuperior to law; and when the actual danger had ceaſed, they might re-eſtabliſh their ancient conſtitution." The opponents of Piſander were unable or afraid to reply: the cabal alone acted with union and with vigour; and difficult as it ſeemed to ſubvert the Athenian democracy, yet this deſign was accompliſhed by the enterpriſing activity of Piſander, the artful eloquence of Theramenes, the firm intrepidity of Phrynichus, and the ſuperintending wiſdom of Antiphon, after it had ſubſiſted a hundred years with unexampled glory.

In a deliberation concerning the means of retrieving the affairs of the republic, Piſander propoſed the electing of ten men, who ſhould be charged with the important truſt of preparing and digeſting reſolutions, to be on an appointed day laid before the aſſembly of the people. When the day arrived, the commiſſioners had but one reſolution to propoſe: "That every citizen ſhould be free to offer his opinion, however contrary to law, without fear of impeachment or trial;" a matter eſſential to the intereſts of the cabal, ſince, by a ſtrange contradiction in government, the Athenian orators and ſtateſmen were liable to proſecution before the ordinary courts of juſtice, for ſuch ſpeeches and decrees as had been approved and confirmed by the aſſembly. In conſequence of this act of indemnity, Piſander and his party boldly declared, that neither the ſpirit nor the forms of the eſtabliſhed conſtitution ſuited the preſent dangerous and alarming criſis. That it was neceſſary to new-model the whole fabric of government; for which purpoſe five perſons (whoſe names he read) ought to be appointed by the people, to chooſe an hundred others; each of whom ſhould ſelect three aſſociates; and the four hundred thus choſen, men of dignity and opulence, who would ſerve their country without fee or reward, ought immediately to be inveſted with the guidance of the republic. This extraordinary propoſal was accepted without oppoſition: the partiſans of democracy dreaded the ſtrength of the cabal; and the undiſcerning multitude perceived not that they ſurrendered their liberties to the artifice of an ambitious faction. But the conduct of the four hundred tyrants ſoon opened the eyes and underſtanding of the moſt thoughtleſs. They aboliſhed every veſtige of ancient freedom; employed mercenary troops to overawe the multitude, and to intimidate or deſtroy their real or ſuſpected enemies. Inſtead of ſeizing the opportunity of annoying the Peloponneſians, they ſent ambaſſadors to ſolicit peace from the Spartans on the moſt diſhonourable terms. Their tyranny rendered them odious in the city, and their cowardice made them contemptible in the camp at Samos. Their cruelty and injuſtice were deſcribed, and exaggerated, by the fugitives who continually arrived in that iſland. The generous youth, employed in the ſea and land ſervice, were impatient of the indignities offered to their fellow-citizens. The ſame indignities might be inflicted on themſelves, if they did not vindicate their freedom. Theſe ſecret murmurs broke out into loud and licentious clamours, which were encouraged by the approbation of the Samians. Thraſybulus and Thraſyllus, two officers of high merit and diſtinction, though not actually entruſted with a ſhare in the principal command, gave activity and boldneſs to the inſurgents. The abettors of the new government were attacked by ſurpriſe: thirty of the moſt criminal were put to death, democracy was reeſtabliſhed in the camp, and the ſoldiers were bound by oath to maintain their hereditary government againſt the conſpiracy of domeſtic foes, and to act with vigour and unanimity againſt the public enemy.

Thraſybulus, who headed this ſucceſsful ſedition, exhorted the ſoldiers not to deſpair of effecting in the capital the ſame revolution which they had produced in the camp. Their moſt immediate concern was to recal Alcibiades, who had been deceived and diſgraced by the tyrants, and who not only felt with peculiar ſenſibility, but could reſent with becoming dignity, the wrongs of his country and his own. The advice of Thraſybulus was approved; he immediately ſailed to Magneſia, and returned with Alcibiades. Near four years had elapſed ſince the eloquent ſon of Clinias had ſpoken in an Athenian aſſembly. Being preſented by Thraſybulus to his fellow-citizens, he began by accuſing his fortune, and lamenting his calamities. "Yet his baniſhment ought not to affect him with permanent ſorrow, ſince it had furniſhed him with an opportunity

to ſerve the cauſe of his country. This event, otherwiſe unfortunate, had procured him the acquaintance and friendſhip of Tiſſaphernes; who, moved by his entreaties, had withheld the ſtipulated pay from the Peloponneſian forces, and who, he doubted not, would continue his good offices to the Athenians, ſupply them with every thing requiſite for maintaining the war, and even ſummon the Phœnician fleet to their aſſiſtance." Theſe were magnificent but flattering promiſes. In making them, Alcibiades however did not conſult merely the dictates of vanity. They raiſed his credit with the army, who immediately ſaluted him general; they widened the breach between Tiſſaphernes and the Spartans; and they ſtruck terror into the tyrants of Athens, who had provoked the reſentment of a man capable to ſubvert their uſurpation.

Alcibiades left the care of the troops to his colleagues Thraſybulus and Thraſyllus, and withdrew himſelf from the applauſes of his admiring countrymen, on pretence of concerting with Tiſſaphernes the ſyſtem of their future operations. But his principal motive was to ſhew himſelf to the Perſian, in the new character with which he was inveſted. Before he returned to the camp, ambaſſadors had been ſent by the tyrants, to attempt a negociation with the partiſans of democracy, who, inflamed by continual reports of the indignities and cruelties committed in Athens, prepared to ſail thither to protect their friends and take vengeance on their enemies. Alcibiades judiciouſly oppoſed this raſh reſolution, which muſt have left the Helleſpont, Ionia, and the iſlands, at the mercy of the hoſtile fleet. But he commanded the ambaſſadors to deliver to their maſters a ſhort but deciſive meſſage: "That they muſt diveſt themſelves of their illegal power, and reſtore the ancient conſtitution. If they delayed obedience, he would ſail to the Piræus, and deprive them of their authority and their lives." When this meſſage was reported at Athens, it added to the diſorder and confuſion in which that city was involved. The four hundred, who had acted with unanimity in uſurping the government, ſoon diſagreed about the adminiſtration, and ſplit into factions, which perſecuted each other as furiouſly as both had perſecuted the people. Theramenes and Ariſtocrates condemned and oppoſed the tyrannical meaſures of their colleagues. The perfidious Phrynichus was ſlain: both parties prepared for taking arms: when the old men, the children, the women, and ſtrangers, interpoſed for the ſafety of a city which had long been the ornament of Greece, the terror of Perſia, and the admiration of the world.

Had the public enemy availed themſelves of this opportunity to aſſault the Piræus, Athens could not have been ſaved from immediate deſtruction. But the Peloponneſian forces at Miletus had broke out into open mutiny, when they heard of the recal of Alcibiades, and the hoſtile intention of Tiſſaphernes. Their reſentment was violent and implacable. They deſtroyed the Perſian fortifications in the neighbourhood of Miletus; they put the garriſons to the ſword; their treacherous commander Aſtyochus ſaved his life by flying to an altar; nor was the tumult appeaſed until the guilty were removed from their ſight, and Myndarus, an officer of approved valour and fidelity, arrived from Sparta to aſſume the principal command. The dreadful conſequences which muſt have reſulted to the Athenians, if, during the fury of their ſedition, the enemy had attacked them with a fleet of an hundred and fifty ſail, may be conceived by the terror inſpired by a much ſmaller Peloponneſian ſquadron of only forty-two veſſels, commanded by the Spartan Hegeſandridas. The friends of the conſtitution had aſſembled in the ſpacious theatre of Bacchus. Meſſengers paſſed between them and the partiſans of Antiphon and Piſander, who had convened in a diſtant quarter of the city. The moſt important matters were in agitation, when the alarm was given that ſome Peloponneſian ſhips were on the coaſt. Both aſſemblies were immediately diſſolved. All ranks haſtened to the Piræus; manned the veſſels in the harbour; launched others; and prepared thirty-ſix for taking the ſea. When Hegeſandridas perceived the ardent oppoſition which he muſt encounter in attempting to land, he doubled the promontory of Sunium, and ſailed towards the iſland of Eubœa. The Athenians reſolutely ſet ſail in purſuit of the enemy, and obſerved them next day near the ſhore of Eretria. The Eubœans, who had long watched an opportunity to revolt, ſupplied the Peloponneſian ſquadron with all neceſſaries in abundance; but, inſtead of furniſhing the Athenians, they retired from the coaſt on their approach. The commanders were obliged to weaken their ſtrength, by detaching ſeveral parties into the country to procure proviſions; Hegeſandridas ſeized this opportunity to attack them: moſt of the Athenian ſhips were taken; the crews ſwam to land; many were cruelly murdered by the Eretrians; and ſuch only ſurvived as took refuge in the Athenian garriſons ſcattered over the iſland.

This misfortune was very alarming to the Athenians; but the magnanimous firmneſs of Theramenes did not allow the friends of liberty to deſpair. He encouraged them to diſburden the republic of thoſe domeſtic foes, who had ſummoned the aſſiſtance of the Lacedæmonian fleet, that they might enſlave their fellow-citizens. Antiphon, Piſander, and others moſt obnoxious, ſeaſonably eſcaped; the reſt ſubmitted. A decree was paſſed, recalling Alcibiades, and approving the conduct of the troops at Samos. The ſedition ceaſed; the democracy, which had been interrupted four months, was reſtored; and the Athenians reſolved to defend, to the laſt extremity, the ancient glory of the republic.

The doubtful Tiſſaphernes heſitated between the part of an open enemy, or a treacherous ally; the Spartans, who had formerly rejected the friendſhip, now courted the protection, of his rival Pharnabazus; to whoſe northern province they ſailed with the principal ſtrength of their armament, leaving only a ſmall ſquadron at Miletus, to defend their ſouthern acquiſitions. The Athenians, animated by the manly counſels of Thraſybulus and Thraſyllus, proceeded northwards in purſuit of the enemy; and the important ſtraits, which join the Euxine and Ægean ſeas, became the ſcene of conflict. In the twenty-firſt winter of the war, and in the year before Chriſt 411, the Athenians prevailed in three ſucceſſive engagements, the event of which became continually more deciſive. In the firſt, which was fought in the narrow channel between Seſtos and Abydus, the advantages were in ſome meaſure balanced, ſince Thraſybulus took twenty Peloponneſian ſhips, with the loſs of fifteen of his own. But the glory remained entire to the Athenians, who repelled the enemy, and offered to renew the battle. Not long afterwards, they intercepted a ſquadron of fourteen Rhodian veſſels, near Cape Rhegium. The iſlanders defended themſelves with their uſual bravery. Myndarus beheld the engagement from the temple of Ilium; and haſtened with great diligence to the ſhore, that he might launch his ſhips, and prevent, by ſpeedy aſſiſtance, the capture or deſtruction of the Rhodians. The principal Athenian ſquadron attacked him near the ſhore of Abydus. The engagement was fought from morning till night, and ſtill continued doubtful, when the arrival of eighteen gallies, commanded by Alcibiades, turned the ſcale of victory. The eſcape of the Peloponneſians was favoured by the bravery of Pharnabazus, who, at the head of his Perſian troops, had been an impatient ſpectator of the combat. He gallantly rode into the ſea, encouraging his men with his voice and his example. The Spartan admiral drew up the greateſt part of his fleet along the ſhore, and prepared to reſiſt the aſſailants; but the Athenians, ſatisfied with the advantages already obtained, ſailed to Seſtos, carrying with them

them thirty Peloponnefian galleys, as well as fifteen of their own which they had loſt in a former engagement. Thraſyllus was ſent to Athens to communicate the good news, and raiſe further ſupplies of men and money.

The Spartans, thus compelled to yield poſſeſſion of the ſea, retired to Cyzicus to repair their ſhattered fleet; while the Athenians profited by the fame of their victory to demand contributions from the wealthy towns in that neighbourhood. It was then determined, by the advice of Alcibiades, to follow the enemy to Cyzicus; for which purpoſe they ſailed, with eighty galleys, to the iſland of Proconneſus, ten miles diſtant from the ſtation of the Peloponneſian fleet. Alcibiades ſurpriſed ſixty veſſels in a dark and rainy morning, as they were manœuvring at a diſtance from the harbour, and ſkilfully cut off their retreat. As the day cleared up, the reſt ſailed forth to their aſſiſtance; the action became general; the Athenians obtained a complete victory, and their valour was rewarded by the capture of the whole Peloponneſian fleet, except the Syracuſan ſhips, which were burnt, in the face of a victorious enemy, by the enterpriſing Hermocrates. The circumſtances of this important action were related in few but expreſſive words, to the Spartan ſenate, in a letter written by Hippocrates, the ſecond in command, and intercepted by the Athenians: "All is loſt; our ſhips are taken; Myndarus is ſlain; the men want bread; we know not what to do."

The fatal diſaſter at Cyzicus prevented the Peloponneſians from obſtructing, during the following year, the deſigns of the enemy, who took poſſeſſion of that wealthy ſea-port, as well as of the ſtrong city Perinthus; raiſed a large contribution on Selembra; and fortified Chryſopolis, a town of Chalcedonia, only three miles diſtant from Byzantium. In this new fortreſs they placed a conſiderable body of troops; and guarded the neighbouring ſtrait with a ſquadron of thirty ſail, commanded by Theramenes and Eubulus, and deſtined to exact, as tribute, a tenth from all ſhips which ſailed through the Boſphorus into the Euxine ſea. The Peloponneſians were aſſiſted by Pharnabazus in equipping a new fleet; but were deprived of the valuable counſels of Hermocrates, whoſe commiſſion was ſuperſeded by the folly of the government of Syracuſe.

Meanwhile Thraſyllus obtained at Athens the ſupplies which he had gone to ſolicit. They conſiſted of a thouſand heavy-armed men, an hundred horſe, and fifty galleys, manned by five thouſand experienced ſeamen. With theſe forces, Thraſyllus ſailed to Samos, hoping to render the twenty-third campaign not leſs glorious than the preceding; and ambitious to rival, by his victories in the central and ſouthern parts of the Aſiatic coaſt, the fame acquired by Alcibiades and Thraſybulus in the north. His firſt operations were ſucceſsful. He took Colophon, with ſeveral places of leſs note, in Ionia, penetrated into the heart of Lydia, and returned to the ſhore, driving before him a numerous body of ſlaves, and other valuable booty. His courage was increaſed by the want of reſiſtance on the part of Tiſſaphernes, whoſe province he had invaded; of the Peloponneſian forces at Miletus; and of the revolted colonies of Athens. He reſolved therefore to attack the beautiful and flouriſhing city of Epheſus, which was then the principal ornament of the Ionic coaſt. While his ſoldiers, in ſeparate diviſions, were making their approaches to the walls, the enemy aſſembled from every quarter to defend the ſacred temple of Epheſian Diana. A vigorous ſally of the townſmen increaſed the ſtrength of Tiſſaphernes and the Peloponneſians, the latter of whom had been reinforced by a conſiderable ſquadron from Sicily. The Athenians were defeated with the loſs of three hundred men; and retiring from the field of battle, they ſought refuge in their ſhips, and ſailed towards the Helleſpont. During the voyage thither, they fortunately fell in with twenty Sicilian galleys, of which they took four, and purſued the reſt to Epheſus. Having ſoon afterwards reached the Helleſpont, they found the Athenian armament at Lampſachus, where Alcibiades thought proper to muſter the whole military and naval forces: but, on this occaſion, the northern army gave a remarkable proof of pride and ſpirit. They, who had ever been victorious, refuſed to rank with the ſoldiers of Thraſyllus, who had been ſo ſhamefully foiled before the walls of Epheſus. They ſubmitted, however, to live in the ſame winter quarters; from whence they made an expedition againſt Abydus. Pharnabazus defended the place with a numerous body of Perſian cavalry. The diſgraced troops of Thraſyllus rejoiced in an opportunity to retrieve their honour. They attacked, repelled, and routed, the enemy. Their victory decided the fate of Abydus, and their courage was approved by the army of Alcibiades, who now embraced them as fellow-ſoldiers and friends.

For ſeveral years the meaſures of the Athenians had been almoſt uniformly ſucceſsful; but the twenty-fourth campaign was diſtinguiſhed by peculiar favours of fortune. The invaſion of Sicily by the Carthaginians prevented that iſland from ſending any effectual aſſiſtance to their Peloponneſian allies. The dangerous revolt of the Medes withheld the Perſian reinforcements, which were neceſſary to ſupport the arms of Pharnabazus. Both nations were repeatedly defeated by the Athenians, driven from their encampments and fortreſſes near the ſhore, and purſued into the inland country, which was plundered and deſolated by the victors. The Athenians returned in triumph to attack the fortified cities, which ſtill declined ſubmiſſion; an undertaking in which Alcibiades diſplayed the wonderful reſources of his extraordinary genius. By gradual approaches, by ſudden aſſaults, by ſurpriſe, by treaſon, or by ſtratagem, he in a few months became maſter of Chalcedon, Salembria, and, at laſt, of Byzantium itſelf. His naval ſucceſs was equally conſpicuous. The Athenians had again the ſovereignty of the ſea. The ſmall ſquadrons fitted out by the enemy ſucceſſively fell into their power; and theſe multiplied captures, which were made with little difficulty, accumulated the trophies of the well-fought battles which we have already deſcribed. It was computed by the partiſans of Alcibiades, that, ſince aſſuming the command, he had taken or deſtroyed two hundred Syracuſan and Peloponneſian galleys; and his ſuperiority of naval ſtrength enabled him to raiſe ſuch contributions, both in the Euxine and Mediterranean, as abundantly ſupplied his fleet and army with every neceſſary article of ſubſiſtence and accommodation.

Yet while the Athenian arms were crowned with ſuch glory abroad, the Attic territory was continually haraſſed by king Agis and the Lacedæmonian troops poſted at Decelia. Their bold and ſudden incurſions frequently threatened the city itſelf; the deſolated lands afforded no advantage to the ruined proprietors; nor could the Athenians venture without their walls, to celebrate their accuſtomed feſtivals. Alcibiades, animated by his foreign victories, wiſhed to relieve the domeſtic ſufferings of his country; and after an abſence of many years, diſtinguiſhed by ſuch a variety of fortune, eagerly longed to reviſit his native city, and to enjoy the rewards and honours uſually beſtowed by the Greeks on ſucceſsful valour. This celebrated voyage to Athens, was performed in the twenty-fifth ſummer of the war. Notwithſtanding all his ſervices, the cautious ſon of Clinias, inſtructed by adverſity, declined to land in the Piræus, until he was informed that the aſſembly had repealed the decrees againſt him, formally revoked his baniſhment, and prolonged the term of his command. Even after this agreeable intelligence, he was ſtill unable to conquer his well-founded diſtruſt of the capricious humours of the people; nor would he approach

the crowded ſhore, till he obſerved, in the midſt of the multitude, his principal friends and relations inviting him by their voice and action. He then landed amidſt the univerſal acclamations of the ſpectators, who, inattentive to the naval pomp, and regardleſs of the other commanders, fixed their eyes only on Alcibiades. Next day an extraordinary aſſembly was ſummoned, in order that he might explain and juſtify his apparent miſconduct, and receive the rewards due to his acknowledged merit. The public anticipated his apology, by contraſting the melancholy ſituation of affairs when Alcibiades aſſumed the command, with the actual condition of the republic. "At the former period Athens yielded the command of the ſea; the enemy were every where victorious; the ſtate was oppreſſed by foreign war, torn by ſedition, without reſources, and without hope. The addreſs and dexterity of Alcibiades was alone capable to have diſunited the councils, to have weakened and afterwards repelled the efforts, of a powerful confederacy; his activity and courage could alone have animated the dejection of the citizens to purſue the meaſures of offenſive war; his abilities, his virtue, and his fortune, could alone have rendered thoſe meaſures ſucceſsful." Before judges ſo favourably diſpoſed to hear him, Alcibiades found no difficulty to make his defence, and to win upon the affections of the people; he was appointed commander in chief by ſea and land; and a hundred galleys were equipped, and tranſports were prepared for fifteen hundred heavy-armed men, with a proportional body of cavalry, waiting his orders, and wholly at his diſpoſal.

While Alcibiades was thus concentrating the ſtrength and ſinews of the Athenians, Lyſander, a hero of the Herculean ſtock, was appointed to the command of the Peloponneſian forces in the eaſt; and ſince the deciſive action at Cyzicus, the Peloponneſians, unable to reſiſt the enemy, had been employed in preparing ſhips on the coaſt of their own peninſula, as well as in the harbours of their Perſian and Grecian allies. The moſt conſiderable ſquadrons had been equipped in Cos, Rhodes, Miletus, and Epheſus; in the laſt of which the whole armament, amounting to ninety ſail, was collected by Lyſander. But the aſſembling of ſuch a force was a matter of little conſequence, unleſs proper meaſures ſhould be taken for enabling it to act with vigour. It was neceſſary, above all, to ſecure pay for the ſeamen; for this purpoſe, Lyſander, accompanied by ſeveral Lacedæmonian ambaſſadors, repaired to Sardis, to congratulate the happy arrival of Cyrus, a generous and valiant youth of ſeventeen, who had been entruſted by his father Darius Nothus, with the government of the inland parts of Leſſer Aſia. Lyſander complained to the young prince, "of the perfidious duplicity of Tiſſaphernes, by which the Athenians had been enabled to re-aſſume that aſcendant in the eaſt, which had formerly proved ſo dangerous to the Perſian name. Pharnabazus had more effectually ſerved the cauſe of his maſter, by his active valour in the field; by detaining the Athenian ambaſſadors, who had been ſent to ſurpriſe the unſuſpecting generoſity of Darius; and by ſupplying the Peloponneſians, after the unfortunate engagement at Cyzicus, with the means of preparing a new fleet, and with the neceſſaries and conveniences of life, while they were employed in this uſeful undertaking. But Tiſſaphernes was unwilling, and Pharnabazus was perhaps unable, to diſcharge the ſtipulated pay, without which the Grecian ſeamen and ſoldiers could not be kept together, or engaged to act with vigour againſt the common enemy." Cyrus replied, "That he had been commanded by his father to aſſiſt the Lacedæmonians, and to pay their troops with punctuality. That, for this purpoſe, he had carried with him five hundred talents (near an hundred thouſand pounds ſterling); and if ſuch a ſum ſhould be found inſufficient, he would expend his own private fortune, and even melt down and coin into money the golden throne on which he ſat." Thus elated, Lyſander returned to Epheſus, diſcharged the arrears due to his troops, gave them a month's pay in advance, raiſed their daily allowance, and ſeduced innumerable deſerters from the Athenian fleet.

While Lyſander was thus anxiouſly employed in manning his ſhips, and preparing them for action, Alcibiades attacked the iſland of Andros. The reſiſtance was more vigorous than he had reaſon to expect: and the immediate neceſſity of procuring pay and ſubſiſtence for the fleet, obliged him to leave his work imperfect. With a ſmall ſquadron he ſailed to raiſe contributions on the Ionian or Carian coaſt, committing the principal armament to Antiochus, a man totally unqualified for ſuch a truſt. Even the affectionate partiality of Alcibiades ſeems to have diſcerned the unworthineſs of his favourite, ſince he gave him ſtrict orders to continue, during his abſence, in the harbour of Samos, and by no means to riſk an engagement. This injunction, as it could not prevent the raſhneſs, might perhaps provoke the vain levity, of the vice-admiral, who, after the departure of his friend, ſailed towards Epheſus, approached the ſterns of Lyſander's ſhips, and with the moſt licentious inſult challenged him to battle. The prudent Spartan delayed the moment of attack, until the preſumption of his enemies had thrown them off their guard. He then commanded the Peloponneſian ſquadrons to advance. His manœuvres were judicious, and executed with ſtrict obedience. The battle was not obſtinate, as the Athenians, who ſcarcely expected any reſiſtance, ſunk at once from the inſolence of temerity into the deſpondency of fear. They loſt fifteen veſſels, with a conſiderable part of their crews. The remainder retired diſgracefully to Samos; while the Lacedæmonians profited of their victory by the taking of Eion and Delphinium. Though fortune thus favoured the prudence of Lyſander, he declined to venture a ſecond engagement with the ſuperior ſtrength of Alcibiades, who, having reſumed the command, employed every artifice to bring him again to action. But ſuch an opportunity he could never again find; and the people of Athens, who expected to hear of nothing but victories and triumphs, were mortified to the laſt degree, when they received intelligence of ſuch a ſhameful defeat. As they could not ſuſpect the abilities, they diſtruſted the fidelity, of their commander. Their ſuſpicions were increaſed and confirmed by the arrival of Thraſybulus, who, whether animated by zeal for the intereſt of the public, or actuated by a ſelfiſh jealouſy, formally impeached Alcibiades in the Athenian aſſembly. "His miſconduct had totally ruined the affairs of his country. A talent for low buffoonery was a ſure recommendation to his favour. His friends were partially ſelected from the meaneſt and moſt abandoned of men, who poſſeſſed no other merit than that of being ſubſervient to his paſſions. To ſuch unworthy inſtruments the fleet of Athens was entruſted; while the commander in chief reveiled in debauchery with the harlots of Abydus and Ionia, or raiſed exorbitant contributions on the dependent cities, that he might defray the expence of a fortreſs on the coaſt of Thrace, which he had erected to ſhelter himſelf againſt the juſt vengeance of the republic." Were it neceſſary to point out by example the inſtability of popular favour, this ſubject might be copiouſly illuſtrated from the hiſtory of the Athenians. The ſame man, whom a few months before they found it impoſſible ſufficiently to reward, was now expoſed to the rage of diſappointment and the fury of revenge. They regretted the loſs of every moment which intervened between the progreſs of their reſentment and the execution of their vengeance. In the ſame aſſembly, and on the ſame day, Alcibiades was accuſed, and almoſt unanimouſly condemned; and, that the affairs of the republic might not again ſuffer by the abuſe

ALCIBIADES.

London, Published as the Act directs, Jan.ry 17.th 1807, by J. Wilkes

abuſe of undivided power, ten commanders were ſubſtituted in his room; among whom were Thraſyllus, Leon, Diomedon, Conon, and Pericles, who inherited the name and merit of his illuſtrious father. The new generals ſailed to Samos; and Alcibiades ſought refuge in his Thracian fortreſs.

They had ſcarcely aſſumed the command, when an important alteration took place in the Peloponneſian fleet. Lyſander's term in the command had expired, and Callicratidas, a Spartan of a very oppoſite character, was ſent to ſucceed him. An univerſal clamour aroſe, when Callicratidas diſplayed his commiſſion in the council of the confederates. The friends of Lyſander affirmed, "That it was imprudent and ungenerous to check the victorious career of a deſerving and fortunate commander; that the important charge of the fleet ought not to be entruſted to men who were deſtitute of experience, and perhaps of abilities; nor would it be juſt to ſacrifice the intereſt of ſuch a numerous and powerful confederacy to a punctilious obſervance of the Lacedæmonian laws." Lyſander maintained a decent ſilence concerning the character of his ſucceſſor, only obſerving that he reſigned to him a fleet which commanded the ſea. The noiſy acclamations of the aſſembly confirmed his aſſertion. But Callicratidas had a heart untainted with reproach, and incapable of fear. Unabaſhed by the turbulence of his opponents, he replied, That he muſt withhold his aſſent to the magnified ſuperiority of the Peloponneſian fleet, unleſs Lyſander ſhould ſet ſail from Epheſus, coaſt along the iſle of Samos, (where the Athenians then lay,) and ſurrender his victorious ſquadrons in the harbour of Miletus. The pride of Lyſander might have been confounded by this judicious obſervation; but his ingenuity ſuggeſted a plauſible, or rather an illuſive, reply, "That he was no longer admiral."

Callicratidas then addreſſed the aſſembly, with the manly ſimplicity of an honeſt heart, which diſdains the artifice of words, defies the inſolence of power, and defeats the intrigues of policy. "Lacedæmonians and allies! I ſhould have been content to ſtay at home; nor does it greatly affect me that Lyſander, or any other, ſhould be held a better ſeaman than myſelf. Hither I have been ſent by my countrymen to command the fleet, and my chief concern is to execute their orders, and to perform my duty. It is my earneſt deſire to promote the public intereſt; but you can beſt inform me whether I ought to continue here, or to return to Sparta." Wonderful is the power of honeſt and unaffected firmneſs. The aſſembly liſtened with admiration; the partiſans of Lyſander were abaſhed; none ventured to ſpeak; and, after a conſiderable pauſe, all unanimouſly acknowledged that it became both Callicratidas and themſelves to obey the orders of the Spartan government.

His firſt operations were directed againſt the ſtrong and populous towns of Methymna and Mitylenè, which reſpectively commanded the northern and ſouthern diviſions of the iſle of Leſbos. Beſides the numerous citizens of an age to bear arms, Methymna was defended by an Athenian garriſon. The place made a brave reſiſtance; but the perſevering efforts of Callicratidas exhauſted its ſtrength: Methymna was taken by ſtorm, and ſubjected to the ravages of the Peloponneſian troops. The garriſon and the ſlaves were treated as part of the booty. The confederates adviſed, that the Methymneans alſo ſhould be ſold into ſervitude; but Callicratidas aſſured them, that, while *he* enjoyed the command, there ſhould not any Grecian citizen be reduced to the condition of a ſlave, unleſs he had taken arms to ſubvert the public freedom.

Meanwhile Conon, the moſt active and enterpriſing of the Athenian commanders, had put to ſea with a ſquadron of ſeventy ſail, in order to protect and defend the coaſt of Leſbos. But the force of Conon was inſufficient to accompliſh the purpoſe it intended. Callicratidas obſerved his motions, diſcovered his weakneſs, and, with a far ſuperior fleet, intercepted his retreat to the armament at Samos. The Athenians ſailed towards the coaſt of Mitylenè, but were prevented from entering the harbour of that place by the reſentment of the inhabitants, who rejoiced in an opportunity to puniſh thoſe who had ſo often conquered, and ſo long oppreſſed, their city. In conſequence of this unexpected oppoſition, the Athenian ſquadron was overtaken by the enemy. The engagement was more ſharp and obſtinate than might have been expected under ſuch an inequality of ſtrength. Thirty empty ſhips (for moſt of their crews ſwam to land) were taken by the Peloponneſians; the remaining forty were hauled up under the walls of Mitylenè: Callicratidas recalled his troops from Methymna, received a reinforcement from Chios, and blocked up the Athenians by ſea and land.

The condition of Conon was highly diſtreſſing. He was ſurrounded on all ſides by a ſuperior force; the town of Mitylenè was hoſtile; his men were deſtitute of proviſions, incapable of reſiſtance, yet unwilling to ſurrender. In this ſituation he attempted the only enterpriſe which could admit of relief. The braveſt and moſt experienced ſeamen were embarked in two ſwift-ſailing veſſels, one of which, eluding the vigilance of the enemy, eſcaped in ſafety to the Helleſpont, and informed the Athenians of the misfortunes and blockade at Leſbos. The intelligence was immediately communicated to Samos and to Athens; and the importance of the object, which was no leſs than the ſafety of forty ſhips, and above eight thouſand brave men, excited uncommon activity. The Athenians reinforced their domeſtic ſtrength with the aſſiſtance of their allies; all able-bodied men were preſſed into the ſervice; and in a few weeks they had aſſembled at Samos an hundred and fifty ſail, which immediately took the ſea, with a reſolution to encounter the enemy. Callicratidas did not decline the engagement. Having left fifty ſhips to guard the harbour of Mitylenè, he proceeded with an hundred and twenty to Cape Malea, the moſt ſouthern point of Leſbos. The Athenians had advanced, the ſame evening, to the iſlands of Arginuſſæ, four miles diſtant from that promontory. The night paſſed in bold ſtratagems for mutual ſurpriſe, which were rendered ineffectual by a violent tempeſt of rain and thunder. At the dawn of day both armaments were eager to engage; but Hermon and Megareus, two experienced ſeamen, and the chief counſellors of Callicratidas, exhorted him not to commit the weakneſs of the Peloponneſians with the ſuperior ſtrength and numbers of the enemy. The generous and intrepid Spartan deſpiſed danger and death in compariſon of glory; but either his magnanimity had not overcome the laſt imperfection of virtuous minds, and was averſe to ſacrifice perſonal glory to public utility, or he imagined that this utility could not be ſeparated from an inflexible adherence to the martial laws of Lycurgus. He anſwered the prudent admonitions of his friends in theſe memorable words, which, according to the conſtruction that is put on them, deſerve our admiration or our pity: "My death cannot be deſtructive to Sparta, but my flight would be diſhonourable both to Sparta and myſelf." So ſaying, he gave the ſignal for his ſhips to advance. The fight was long and bloody; paſſing, ſucceſſively, through all the different gradations, from diſciplined order and regularity to the moſt tumultuous confuſion. The Spartan commander was ſlain in the ſevereſt part of the action. The hoſtile ſquadrons fought with various fortune, and promiſcuouſly conquered, purſued, ſurrendered, or fled. Thirteen Athenian veſſels were taken by the Peloponneſians; but, at length, the latter gave way on all ſides; ſeventy of their ſhips were captured, the reſt eſcaped to Chios and Phocæa.

The Athenian admirals, though juſtly elated with their good fortune, cautiouſly deliberated concerning the

the beſt means of improving their victory. Several adviſed that the fleet ſhould ſteer its courſe to Mitylenè, to ſurpriſe the Peloponneſian ſquadron which blocked up the harbour of that city. Diomedon recommended it as a more eſſential object to recover the bodies of the ſlain, and to ſave the wreck of twelve veſſels which had been diſabled in the engagement. Thraſybulus obſerved, that by dividing their ſtrength, both purpoſes might be effected. His opinion was approved. The charge of preſerving the wrecks, and collecting the bodies of the dead, was committed to Theramenes and Thraſybulus. Fifty veſſels were deſtined to that ſervice, doubly recommended by humanity and religion. The remainder ſailed to the iſle of Leſbos, in queſt of the Peloponneſians on that coaſt, who narrowly eſcaped deſtruction, through the good management of Eteonicus, the Spartan vice-admiral. Soon after the engagement, a brigantine arrived at Mitylenè, acquainting him with the death of Callicratidas, and of the defeat and flight of the Peloponneſian fleet. The ſagacity of Eteonicus foreſaw the probable conſequences of thoſe events. The Athenians would naturally ſail from Arginuſſæ to purſue their good fortune, and Conon, who was ſhut up at Mitylenè, would be encouraged to break through the harbour, that he might join his victorious countrymen. In order to anticipate thoſe meaſures, and to facilitate his own retreat, the Spartan commander ordered the brigantine privately to leave the harbour, and to return, at the diſtance of a ſhort time, with joyous acclamations and muſic, the rowers crowned with garlands, and calling out that Callicratidas had deſtroyed the laſt hope of Athens, and obtained a glorious and deciſive victory. The contrivance ſucceeded; the Spartans thanked heaven for the good news by hymns and ſacrifices; the ſailors were enjoined to refreſh themſelves by a copious repaſt, and to profit of a favourable gale to ſail to the iſle of Chios; while the ſoldiers burned their camp, and marched northward to Methymna, to reinforce the garriſon there, which was threatened by the enemy.

While the prudent foreſight of Eteonicus ſaved the Peloponneſian ſquadron at Mitylenè, the violence of a ſtorm prevented Theramenes and Thraſybulus from ſaving their unfortunate companions, all of whom, excepting one of the admirals, and a few others who eſcaped by their extraordinary dexterity in ſwimming, were overwhelmed by a tempeſtuous ſea; nor could their dead bodies ever be recovered. The Athenians were likewiſe diſappointed of the principal advantages which ought to have reſulted from the engagement. Methymna was too ſtrongly fortified to be taken by aſſault; they could not ſpare time for a regular ſiege; and when they proceeded to Chios in queſt of the Peloponneſian fleet, they found it carefully ſecured in the principal harbour of that iſland, which had been put in a vigorous ſtate of defence. Theſe unforeſeen circumſtances were the more mortifying to the commanders, becauſe, immediately after the battle, they had ſent an advice-boat to Athens, acquainting the magiſtrates with the capture of ſeventy veſſels; mentioning their intended expeditions to Mitylenè, Methymna, and Chios, from which they had reaſon to hope the moſt diſtinguiſhed ſucceſs; and particularly taking notice that the important charge of recovering the bodies of the drowned or ſlain had been committed to Theramenes and Thraſybulus, captains of approved conduct and fidelity.

The joy which the Athenians received from this flattering intelligence was converted into rage and diſappointment, when they underſtood that their fleet had returned to Samos, without reaping the expected fruits of victory. They were afflicted beyond meaſure with the loſs of the wreck, by which their brave countrymen had been deprived of the ſacred rites of funeral; a circumſtance viewed with peculiar horror, becauſe it was ſuppoſed, according to a ſuperſtition conſecrated by the belief of ages, to ſubject their melancholy ſhades to wander an hundred years on the gloomy banks of the Styx, before they could be tranſported to the regions of light and bliſs. The relations of the dead lamented their private misfortunes; the enemies of the admirals exaggerated the public calamity; both demanded an immediate and ſerious examination into the cauſe of this diſtreſsful event, that the guilty might be diſcovered and puniſhed. Amidſt this general ferment, Theramenes ſailed to Athens, with a view to exculpate himſelf and his colleague Thraſybulus. The letter ſent thither before them had excited their fear and their reſentment; ſince it rendered them reſponſible for a duty which they found it impoſſible to perform. Theramenes accuſed the admirals of having neglected the favourable moment to ſave the periſhing, and to recover the bodies of the dead; and, after the opportunity of this important ſervice was irrecoverably loſt, of having devolved their charge on others, in order to ſkreen their own miſconduct. The Athenians greedily liſtened to the accuſation, and caſhiered the abſent commanders. Conon, who during the action remained blocked up at Mitylenè, was intruſted with the fleet. Protomachus and Ariſtogenus choſe a voluntary baniſhment. The reſt returned home to juſtify meaſures which appeared ſo criminal.

Archedemus, an opulent and powerful citizen, and Callixenus, a ſeditious demagogue, partly moved by the intreaties of Theramenes, and partly excited by perſonal reſentment, impeached the admirals to the ſenate. The accuſation was ſupported by the relations of the deceaſed, who appeared in mourning robes, their heads ſhaved, their arms folded, their eyes bathed in tears, piteouſly lamenting the loſs and diſgrace of their families, deprived of their protectors, who had been themſelves deprived of thoſe laſt and ſolemn rites to which all mankind are entitled. A falſe witneſs ſwore that he had been ſaved almoſt by miracle from the wreck, and that his companions, as they were drowning, charged him to acquaint his country how they had fallen victims to the cruel neglect of their commanders. Callixenus called out for ample and condign puniſhment to be immediately inflicted on the devoted admirals; this was vociferated by the noiſy rabble; and the ſenators were intimidated into a reluctant compliance with meaſures which they diſapproved, and by which they were for ever to be diſgraced. Yet the philoſophic firmneſs of Socrates diſdained to ſubmit. He proteſted againſt the tameneſs of his colleagues, and declared that neither threats, nor danger, nor violence, ſhould compel him to conſpire with injuſtice for the deſtruction of the innocent.

But what could avail the voice of one virtuous man amidſt the licentious madneſs of thouſands? The commanders were accuſed, tried, condemned, and, with the moſt irregular precipitancy, delivered to the executioner. Before they were led to death, Diomedon addreſſed the aſſembly in a ſhort but ever-memorable ſpeech. "I am afraid, Athenians! leſt the ſentence which you have paſſed on us prove hurtful to the republic. Yet I would exhort you to employ the moſt proper means to avert the vengeance of heaven. You muſt carefully perform the ſacrifices which, before giving battle at Arginuſſæ, we promiſed to the gods in behalf of ourſelves and of you. Our misfortunes deprive us of an opportunity to acquit this juſt debt, and to pay the ſincere tribute of our gratitude. But we are deeply ſenſible that the aſſiſtance of the gods enabled us to obtain that glorious and ſignal victory." The diſintereſtedneſs, the patriotiſm, and the magnanimity, of this diſcourſe, muſt have appeaſed (if any thing had been able to appeaſe) the tumultuous paſſions of the vulgar. But their headſtrong fury defied every reſtraint of reaſon or of reſentment. They perſiſted in their bloody purpoſe, which was executed without pity: yet their cruelty was followed by a ſpeedy repentance, and puniſhed

by the ſharp pangs of remorſe, the intolerable pain of which they vainly attempted to mitigate by inflicting a well-merited vengeance on the worthleſs and deteſtable Callixenus.

The removal of the Athenian admirals, and the defeat and death of the Spartan Callicratidas, ſuſpended for ſeveral months the military and naval operations on both ſides. The behaviour of Philocles and Adimanthus, who had been joined in authority with Conon, were better fitted to obſtruct than promote the meaſures of that brave and prudent commander. The Spartans, in the mean while, at the requeſt of their allies, reſtored Lyſander to the command of the Peloponneſian fleet. He was again received at Sardis by the Perſian prince, with the warmeſt demonſtrations of joy. He was ſupplied with money to ſatisfy the immediate wants of the troops; and, as Cyrus at that time happened to make a journey into Upper Aſia, the revenues of his wealthy province were conſigned to the management of his Spartan friend. Such powerful reſources could not remain unemployed in the active hands of Lyſander. His emiſſaries aſſiduouſly engaged or preſſed the Ionian and Carian ſeamen. The harbours of Aſia Minor, particularly the port of Epheſus, glowed with the ardour of naval preparation, and in a few months Lyſander ſailed to the Helleſpont with an hundred and fifty gallies, and attacked the important town of Lampſacus. The place, though vigorouſly defended by the Athenian garriſon, was taken by ſtorm; and according to the barbarous practice of the age, abandoned to the licentious rapacity, the avarice, the luſt, and fury, of the conquerors.

The languid and indeciſive meaſures of the Athenians at Samos accuſe the abilities of Tydeus, Menander, and Cephiſodotus, who had been joined in command with Conon and his unworthy colleagues. They ſailed too late to ſave Lampſacus; but as they poſſeſſed an hundred and eighty gallies, a force ſuperior to Lyſander's, they anchored on the oppoſite or European ſide of the Helleſpont, at the diſtance of fifteen furlongs, in order to provoke the enemy to an engagement. Their ſtation was injudiciouſly taken at the mouth of the Ægos Potamos, diſtant two miles from Seſtos, the neareſt town from which the fleet could be provided with neceſſaries. Alcibiades, who in his Thracian retirement was unable to withdraw his attention from the war in which he had ſo long acted a diſtinguiſhed part, modeſtly admoniſhed his countrymen of their imprudence; but he was arrogantly reproached for preſuming, while an exile and an outlaw, to give advice to the admirals of Athens. Deſpiſing the inferiority of the Peloponneſian fleet, they advanced in order of battle to the harbour of Lampſacus; and when the enemy moved not from their ſtation, they returned in triumph as acknowledged maſters of the ſea. The prudence of Lyſander perceived and indulged their preſumption. During four days he bore, with extraordinary patience, their repeated inſults, affecting the utmoſt diſinclination to an engagement, carefully retaining his fleet in a place of ſecurity, and regularly diſpatching a few ſwift-ſailing veſſels to obſerve the motions and behaviour of the Athenians, when they returned from their daily cruiſe to the road of Ægos Potamos.

The fifth day they again bore up to the Peloponneſians, and provoked them to battle by more daring menaces than on any former occaſion. As they flattered themſelves with an undoubted proſpect of ſucceſs, they yielded without reſerve to the idle petulance of proſperity, and debated in what manner they ſhould treat the Lacedæmonian priſoners who muſt ſoon fall into their power. The cruel Philocles propoſed to cut off their right hands, that thoſe enemies of Athens might be equally incapable to manage the oar and to brandiſh the ſpear; and this baſe reſolution, though oppoſed by Adimantus, was approved by the majority of his colleagues. After inſulting the enemy in a manner the moſt mortifying and diſgraceful, they retired with an air of exultation mingled with contempt. The Peloponneſian ſpy-boats followed them as uſual at a convenient diſtance, and obſerved that they had no ſooner reached their ſtations than the ſeamen landed, ſtraggled about the ſhore, advanced into the inland country in queſt of proviſions or amuſement, indulged in indolence, or revelled in diſorder. The advice-boats returned with uncommon celerity to convey the welcome intelligence to Lyſander, who had embarked the troops, cleared his ſhips, and made every neceſſary preparation to avail himſelf of the favourable opportunity to effect by ſtratagem what it might have been dangerous to attempt by force. When his ſcouts approached the middle of the channel, they hoiſted their ſhields, which was the appointed ſignal, and at the ſame moment the Peloponneſian ſquadrons were commanded to ſet ſail that they might ſurpriſe the hoſtile fleet, and indulge that reſentment which had been rendered more violent by the long and repeated inſults of the enemy. The victory was complete, if that can be called a victory where there was ſcarcely any reſiſtance. The vigilant activity of Conon endeavoured to aſſemble the ſtrength of the Athenians; but his advice was diſdained by officers incapable and unworthy of command, and his orders were deſpiſed by ſeamen unaccuſtomed and unwilling to obey. At length they became ſenſible of the danger when it was impoſſible to reſiſt it. Their ſhips were taken, either altogether empty, or manned with ſuch feeble crews as were unable to work, much leſs to defend, them. The troops and ſailors who flocked to the ſhore from different quarters, and with diſordered precipitation, were attacked by the diſciplined valour of the Peloponneſians. Thoſe who fought were ſlain; the remainder fled into the inmoſt receſſes of the Cherſoneſus, or took refuge in the Athenian fortreſſes which were ſcattered over that peninſula. When Lyſander reviewed the extent of his well-merited ſucceſs, he found that of a fleet of an hundred and eighty ſail, only nine veſſels had eſcaped, eight of which were conducted by Conon to the friendly iſland of Cyprus, while the ninth carried to Athens the melancholy news of a diſaſter equally unexpected and fatal. An hundred and ſeventy one gallies, and three thouſand priſoners (among whom were Philocles and Adimantus), rewarded the patience and fortitude of Lyſander, who returned with his ſpoil to Lampſacus, amidſt the acclamations of naval triumph.

Before purſuing the natural conſequences of an event the moſt important that had hitherto happened in all the Grecian wars, it was neceſſary for Lyſander to decide the fate of the Athenian priſoners, againſt whom the confederates were animated by all that unrelenting hatred which is congenial to the ſtern character of republicans exaſperated by continual provocation and inſult. The injuſtice and cruelty of that ambitious people were carefully deſcribed and maliciouſly exaggerated in the tribunal of their enemies. "It would be tedious to enumerate, though it was impoſſible ever to forget, their multiplied and abominable crimes, of which ſo many individuals, and ſo many communities, had been the innocent and unhappy victims. Even of late they had deſtroyed without remorſe, and without the ſhadow of neceſſity, the helpleſs crews of a Corinthian and an Andrian veſſel. The gods had averted the atrocious reſolution propoſed by the bloody Philocles, of which the author and the approvers were equally criminal; nor could thoſe deſerve pardon who were incapable of pity." Such diſcourſe, which reſounded from every quarter of the aſſembly, declared, without the neceſſity of a formal vote, the unanimous decree of the confederates. As the priſoners had been ſtripped of their arms, there was nothing to be feared from their numbers and deſpair. They were conducted into the preſence of their armed judges; and, as a prelude to the inhuman maſſacre, Lyſander ſternly demanded of

Philocles what he deſerved to ſuffer for his intended cruelty. The Athenian replied with firmneſs, "Accuſe not thoſe whom you are entitled to judge, but inflict on us the ſame puniſhment which we, in a different fortune, would have inflicted on our enemies." The words were ſcarcely ended, when Lyſander hacked him in pieces. The Peloponneſian ſoldiers followed the ſavage example of their commander. Of three thouſand Athenians, Adimantus alone was ſpared, becauſe he had oppoſed the deteſtable reſolution of Philocles.

During his various triumphs, Lyſander never loſt ſight of the reduction of Athens; an object important in itſelf, and neceſſary to the completion of his extenſive plan. The vigilance of the Peloponneſian ſquadrons prevented the uſual ſupplies of foreign grain from reaching that diſtreſſed city. In all the towns which ſurrendered, or which were taken by ſtorm, the Athenian garriſons were ſaved from immediate death, only on condition that they returned to their native country. By ſuch contrivances the crafty Spartan expected that the ſcarcity of proviſions would ſoon compel the growing multitude of inhabitants to ſubmit to the Lacedæmonian army at Decelia. But the Athenians, who deſpiſed the aſſaults of the enemy, braved the hardſhips of famine. Even after Lyſander had blocked up their harbours with an hundred and fifty ſail, they ſtill vigorouſly defended their walls and ramparts; patiently endured fatigue and hunger; and beheld with obſtinate unconcern, the affliction of their wives and children. Amidſt the ravages of death and diſeaſe, which advanced with increaſing horror, they puniſhed, with the utmoſt ſeverity, the ignoble cowardice of Archeſtratus, who firſt mentioned capitulation, and declared that the ſame moment ſhould put an end to their independence and their lives.

But notwithſtanding the melancholy firmneſs of the popular aſſembly, a numerous and powerful party in the ſtate was governed rather by intereſt than by honour; and the greateſt enemies of Athenian liberty flouriſhed in the boſom of the republic. The ariſtocratical leaven of the Four Hundred had infected the whole body of the ſenate; and not only the inconſtant Theramenes, but ſeveral other men of abilities and influence, who had been moſt active in ſubverting that cruel tyranny, regretted the reſtoration of democracy to a people, who, as appeared from their conduct, were unable to enjoy, without abuſing, the invaluable gift of freedom. In republican governments, the misfortunes which ought to bind all ranks of men in the firmeſt and moſt indiſſoluble union, have often little other tendency than to exaſperate the political factions which rend and diſtract the community. Amidſt every form of public diſtreſs, the Athenians caballed, clamoured, accuſed and perſecuted each other; and the faction of the nobles, who acted with ſuperior concert, vigour, and addreſs, deſtroyed, by dark inſinuations, falſe witneſſes, perjury, and every other ſpecies of legal fraud and cruelty, the ſeditious Cleophon, and other turbulent demagogues, who might moſt effectually have oppoſed their meaſures. In the midſt of this confuſion and diſtreſs, Theramenes propoſed an embaſſy to Lacedæmon, which ſhould requeſt a ſuſpenſion of hoſtilities, and obtain, if poſſible, ſome moderate terms of accommodation. He named himſelf, with nine colleagues, as the perſons beſt qualified to undertake this important commiſſion; flattering the people in the cleareſt and leaſt ambiguous terms, with an undoubted proſpect of ſucceſs. A decree was immediately paſſed, inveſting the ambaſſadors with full powers. They aſſumed the ſacred badge of their inviolable character, reached in ſafety the Spartan camp, held a conference with king Agis, and afterwards repaired to the Lacedæmonian capital. During four months they carried on their pretended negociation with the ſenate, the ephori, and eſpecially with Lyſander, whoſe authority, being unknown to the ancient conſtitution of Sparta, was far more extenſive than that of all the other magiſtrates together. With him, principally, the plan was concerted for compelling the Athenians to ſubmit to terms of diſgrace. The fortifications of their harbours were to be demoliſhed, as well as the long walls which joined them with the city: they were to ſurrender all their ſhips but twelve; to reſign every pretenſion to their ancient poſſeſſions in foreign parts; to recal from baniſhment the ſurviving members of the late tyrannical ariſtocracy; to follow the ſtandard of Sparta in war; and, in peace, to mould their political conſtitution after the model which that victorious republic might think fit to preſcribe. When Theramenes produced theſe humiliating fruits of his boaſted negociation, the Athenians had no longer either ſtrength to reſiſt, or courage to die. During the long abſence of their ambaſſadors, the ſiege had been carried on with redoubled vigour. The Lacedæmonians, reinforced by the Thebans, as well as by their numerous allies of Peloponneſus, had inveſted the city on every ſide; the harbours were cloſely blocked up by Lyſander, who had become maſter of Melos, Ceos, Ægina, and Salamis; iſlands ſo near to Athens that they were almoſt regarded as a part of the Attic territory. The greateſt miſery prevailed within the walls; the famine was intolerable, and the diſeaſes more intolerable than the famine.

On the 16th of May, in the year before Chriſt 404, the day on which the Athenians had been accuſtomed to celebrate the anniverſary of the immortal victory of Salamis, the hoſtile armament took poſſeſſion of their harbours; the combined army entered their gates. The walls and fortreſſes of the city of Minerva, which the generous magnanimity of its inhabitants, preferring the public ſafety to their own, had abandoned in defence of Greece to the fury of a barbarian invader, were ungratefully levelled to the ground by the implacable reſentment of the Greeks themſelves; who executed their deſtructive purpoſe with all the eagerneſs of emulation, boaſting, amidſt the triumphs of martial muſic, that the demolition of Athens would be regarded, in ſucceeding ages, as the true era of Grecian freedom. Yet, after they had gratified their vengeance, they ſeemed to regret its effects. The day was concluded with a magnificent feſtival, in which the recitation of the poets formed, as uſual, the principal ornament of the entertainment. Among other pieces was rehearſed the Electra of Euripides, and particularly that affecting chorus, "We come, O daughter of Agamemnon! to thy ruſtic and humble roof." The words were ſcarcely uttered, when the whole aſſembly melted into tears; the forlorn condition of that young and virtuous princeſs, expelled the royal palace of her father, and inhabiting a miſerable cottage, in want and wretchedneſs, recalling the dreadful viciſſitude of fortune which had befallen Athens, once miſtreſs of the ſea, and ſovereign of Greece, but deprived, in one fatal hour, of her ſhips, her walls, and her ſtrength, and reduced, from the pride of power and proſperity, to miſery, dependence, and ſervitude, without exerting one memorable effort to brighten the laſt moment of her deſtiny, and to render her fall illuſtrious.

Thus did the fall of Athens, and the acknowledged ſuperiority of Sparta, terminate the memorable Peloponneſian war, of twenty-ſeven years duration. Lacedæmon, allied to Perſia, became decidedly the leading power of Greece; and ariſtocracy triumphed over the democratical form of government in almoſt every commonwealth of the Grecian ſtates.

From the FALL of ATHENS to the PEACE of ANTALCIDAS.

The Athenians had ſurrendered their fleet; their walls and harbours were demoliſhed; the citadel was occupied by a Lacedæmonian garriſon; their government was uſurped by thirty men, the dependants and creatures of Sparta! The furious and profligate Critias formed

formed a proper head for this ariſtocratical council, whoſe members have been juſtly branded in hiſtory with the epithet of the Thirty Tyrants. On pretence of delivering the ſtate from the malice of ſeditious men, they deſtroyed the moſt valuable portion of the community. Niceratus, the ſon of Nicias, who inherited not only the opulence, but the virtues, of his father, was condemned to death; Leon, the moſt public-ſpirited, and Antiphon, the moſt eloquent, of his contemporaries, ſhared the ſame fate; Thraſybulus and Anytus were baniſhed. Whoever was known to be powerful, was regarded as dangerous; whoever was ſuppoſed to be rich, was accuſed as criminal. Strangers and citizens were involved in one promiſcuous ruin. Amidſt this general wreck, the perſecution of Lyſias and his family, merits particular notice: Cephalus, the father of that ingenious orator, was by birth a Syracuſan. The friendſhip of Pericles perſuaded him to ſettle in Athens, where, under the protection of that powerful ſtateſman, he obtained wealth and honours. His inoffenſive character eſcaped the enmity to which the opulent Athenians were too commonly expoſed. His ſons, Lyſias and Polemarchus, inherited his generoſity, and his good fortune. Though poſſeſſed of the moſt valuable accompliſhments, the brothers prudently kept aloof from the dangerous paths of public life; contented with their domeſtic felicity, they aſpired not to the rank of Athenian citizens; but liberally contributed to ſupply the exigencies of the ſtate from the profits of a flouriſhing manufacture of ſhields, which they carried on by the labour of an hundred and twenty ſlaves. The cruelty of the thirty tyrants, from whoſe rapacious eye neither obſcurity could conceal, nor merit defend, occaſioned the death of Polemarchus, and the immediate misfortunes, as well as the future glory, of his brother Lyſias, who lived to act a diſtinguiſhed part in overturning that deteſtable tyranny, and in bringing its authors to condign puniſhment. The particulars of this diabolical tranſaction are related by Lyſias with perſpicuous preciſion: "The tyrants Theognis and Piſo acquainted their aſſociates, that many ſtrangers eſtabliſhed at Athens were diſaffected to the government. This was a plauſible pretext for rifling the effects of theſe unhappy men; a meaſure to which the thirty were not only excited by avarice, but prompted by fear. Money was become neceſſary for the preſervation of their power, which, being founded on uſurpation, could only be maintained by the influence of corruption, and the mercenary aid of foreign troops. The life of man, therefore, they regarded as a matter of little moment; the amaſſing of wealth was the principal object of their deſire; to gratify which, ten ſtrangers were at once devoted to deſtruction. In this number, indeed, were two poor men; a baſe and cruel artifice to perſuade you, Athenians! that the remaining eight had been condemned, not for the ſake of their riches, but in order to preſerve the public tranquillity; as if the intereſt of the public had ever been the concern of that tyrannical cabal! Their infamous deſign was executed with inhuman cruelty. Their victims were taken in their beds, at ſupper, in the privacy of domeſtic retirement. Me they ſeized exerciſing the rites of hoſpitality; my gueſts were rudely diſmiſſed; I was delivered into the cuſtody of the worthleſs Piſo. I aſked him, 'Whether money could ſave my life?'—'Yes, a conſiderable ſum.'—'I will give you a talent of ſilver.' This he conſented to accept, as the price of my ſafety; and to ſuch a melancholy ſituation was I reduced, that it afforded me a momentary conſolation to depend on the precarious faith of a man, who (as I well knew) deſpiſed every law, human and divine. But my comfort was of ſhort duration; for I had no ſooner opened my coffer to pay him the talent, than he ordered his attendant to ſeize the contents, conſiſting of three talents of ſilver, an hundred darics, three hundred cyzicenes, and three ſilver cups. I entreated Piſo to allow me a ſmall ſum to defray the expence of my journey. But he deſired me to be thankful to eſcape with my life. Going out together, we met his aſſociates Melobius and Mneſitheides. They inquired where we were going. Piſo anſwered, to examine the houſe of my brother Polemarchus. They deſired him to proceed; but commanded me to follow them to the houſe of Damaſippus. Piſo whiſpered me to be ſilent, and to fear nothing, becauſe he would immediately come there. Upon our arrival, we found Theognis guarding ſeveral of my companions in calamity. I increaſed the number of his priſoners; but obtained an opportunity to repreſent my innocence and misfortunes to Damaſippus, entreating him, by our paſt friendſhip, to employ his influence in my behalf. He aſſured me of his intention to intercede with Theognis, whoſe avarice would eaſily perſuade him to betray his truſt. While they converſed on this ſubject, I took advantage of my knowledge of the houſe to eſcape through three ſecret paſſages, which all happened to be open and unguarded; and fortunately reaching the country-houſe of my friend Archimaus, I ſent him to the city, that he might bring me intelligence of my brother. He diſcovered, that the tyrant Eratoſthenes had dragged him from the road, and conducted him to priſon, where he was ordered to drink hemlock. At this melancholy news, I ſailed to Megara, under cover of the night. Our effects became the property of the tyrants, whoſe mean avarice ſpared not the ſmalleſt trifle belonging to us. Even the gold ear-rings of Polemarchus's wife were forcibly torn away by the brutal Melobius."

The Thirty juſtified theſe abominable acts of cruelty by the authority of a ſervile ſenate, which they ſtill allowed to ſubſiſt as the inſtrument and accomplice of their tyranny. It could not be expected, however, that in a city accuſtomed to the utmoſt liberty of opinion and freedom of debate, a body of five hundred, or even of thirty men, ſhould continue to agree in the ſame odious and oppreſſive meaſures. The firſt ſeeds of diſcord appeared in the ſpeeches and behaviour of the bold and active Theramenes; who, though the principal author of the uſurpation, was diſpoſed by the humanity of his nature, or by the ſingular inconſtancy of his temper, to deſtroy the work of his own hands. But he was ſpeedily ſtopped in his career; he was brought before his tyrants; the ſenate was aſſembled for his trial; and the tribunal was ſurrounded by armed men. When the criminal appeared, Critias addreſſed the court in a ſpeech too remarkable ever to be forgotten.

"Should you imagine, O ſenators! conſidering the great numbers who have ſuffered death, that we have been guilty of unneceſſary cruelty, you will alter that opinion on reflecting that revolutions of government muſt always be attended with bloodſhed; but particularly when a populous city like Athens, which has been long pampered with liberty, is reduced under the dominion of a few. The actual form of adminiſtration was impoſed by the Lacedæmonians as the condition of the public ſafety. In order to maintain its authority, we have removed thoſe ſeditious demagogues, whoſe democratical madneſs hath occaſioned all our paſt calamities. It is our duty to proceed in this uſeful work, and to deſtroy, without fear or compaſſion, all who would diſturb the public tranquillity. Should a man of this dangerous diſpoſition be found in our own order, he ought to be puniſhed with double rigour, and treated not only as an enemy but as a traitor. That Theramenes is liable to this accuſation, appears from the whole tenour of his conduct. He concluded the treaty with the Lacedæmonians; he diſſolved the popular government; he directed and approved the firſt and boldeſt meaſures of our adminiſtration: but no ſooner did difficulties ariſe, than he deſerted his aſſociates, declared his oppoſition

to

to their deſigns, and undertook the protection of the populace. When the weather was fair and favourable, he purſued the ſame courſe with his companions, but, on the firſt change of wind, he thought proper to alter his navigation. With ſuch an irreſolute ſteerſman it is impoſſible to govern the helm of the republic, and to guide the veſſel to her deſtined harbour. This dangerous inconſiſtency ought, indeed, to have been expected from a man to whoſe character perfidy is congenial. He began his political career under the direction of his father Hagnon, a violent partiſan of democracy. He afterwards changed his ſyſtem, in order to obtain the favour of the nobles. He both eſtabliſhed and diſſolved the government of the four hundred; and the whole ſtrain of his behaviour proves him unfit to govern, and unworthy to live." The tyrant then made a ſignal to the armed men, to ſhew the points of their daggers; and ſtepping forward, ſaid, "It is the duty, O ſenators! of a prudent magiſtrate, to prevent the deception and danger of his friends. The countenance of thoſe brave youths (pointing to his armed partiſans) ſufficiently diſcovers that they will not permit you to ſave a man who is manifeſtly ſubverting the government: I, therefore, with the approbation of my colleagues, condemn him to immediate death." Rouſed by this unexpected and ſevere ſentence, Theramenes ſtarted from his ſeat, and ſprang to the altar of the ſenate-houſe, at once imploring the compaſſion and urging the intereſt of the ſpectators, whoſe lives might be ſacrificed as unjuſtly and cruelly as his own. But the terror of armed violence prevented any aſſiſtance; and he was dragged from the altar, and hurried to execution.

In exerciſing ſuch abominable acts of cruelty, the Thirty probably conſulted the immediate ſafety of their perſons, but they precipitated the downfal of their power. The oppreſſed Athenians, whoſe ſufferings ſeemed no longer tolerable, required only a leader to rouſe them to arms, and to conduct them to victory and to vengeance. This danger the tyrants had greater reaſon to apprehend, ſince they could not expect a reinforcement to the garriſon, while the efforts of Lyſander and the Spartans were principally directed towards the extenſion of their Aſiatic conqueſts. The abilities and reſentment of Alcibiades pointed him out as the perſon beſt qualified to undertake the arduous and honourable deſign of re-aſſembling the fugitives, and of animating them with courage to recover their loſt country; but the cruel fears of the tyrants purſued him to his laſt retreat, where he was moſt iniquitouſly aſſaſſinated. Although the life of Alcibiades had been highly pernicious to his country, his death, at this particular juncture, might be regarded as a misfortune, had not the Athenian exiles been headed by a man who poſſeſſed his excellencies, unmingled with his defects and vices. The enterpriſing courage of Thraſybulus was animated by the love of liberty; and, while he generally followed the rules of juſtice and humanity, he had magnanimity to conceive, abilities to conduct, and perſeverance to accompliſh, the boldeſt and moſt arduous deſigns. Having communicated his intentions to the unhappy fugitives in Thebes and Megara, he encouraged a body of ſeventy intrepid followers to ſeize the important fortreſs of Phyla, ſituate on the Bœotian and Athenian frontier. Meanwhile the orator Lyſias, whoſe domeſtic ſufferings are above deſcribed, collected three hundred men to take vengeance on the murderers of his brother, and the authors of his own baniſhment. Theſe and other uſeful ſupplies encouraged Thraſybulus to ſurpriſe and attack the Piræus. This enterpriſe was crowned with ſucceſs, although the tyrants brought forth their whole force to oppoſe it. The battle was neither long nor bloody; but Critias and Hippomachus, the two moſt violent of the tyrants, were happily among the ſlain. Ten magiſtrates (one elected from each tribe) were now appointed to govern Athens; and the ſurviving tyrants, with thoſe who were united with them in guilt, fled to Eleuſis.

It might be expected that the Decemvirs, who aſſumed the government, ſhould have been deterred from injuſtice by the fatal example of their predeceſſors. But in the turbulent republics of Greece, however free in theory, men were little acquainted with the benefits of practical liberty. Whether the nobles, or people, or a prevailing faction of either, whatever party in the ſtate, obtained the chief adminiſtration, their authority was almoſt alike oppreſſive and tyrannical. Alternately maſters and ſlaves, thoſe fierce republicans were either unable or unwilling to draw that deciſive and impervious line between the power of government and the liberty of the ſubject; a line which forms the only ſolid barrier of an uniform, conſiſtent, and rational, freedom. The ten had no ſooner been inveſted with the enſigns of command, than they ſhewed an equal inclination with the thirty to obey the Lacedæmonians, and to tyranniſe over their fellow-citizens. After various ſkirmiſhes, which happened in the courſe of two weeks, and generally proved honourable to the bravery and conduct of Thraſybulus, the tyrants both in Eleuſis and in Athens diſpatched meſſengers to ſolicit aſſiſtance from Sparta and Lyſander. That enterpriſing leader employed his uſual diligence to protect the government which he had eſtabliſhed. At the head of a powerful body of mercenaries, he marched to the Piræus, which he inveſted by land; while his brother Libys, who commanded a conſiderable ſquadron, blocked up the harbour.

Theſe vigorous exertions reſtored the hopes of the tyrants; nor can it be doubted that Thraſybulus and his followers muſt have been compelled to ſurrender, had the Spartan commanders been allowed to act without controul. But the arrogance of Lyſander, and the rapacity of his dependants, provoked the indignation and reſentment of whatever was moſt reſpectable in his country. The kings, magiſtrates, and ſenate, conſpired to humble his ambition; and, leſt he ſhould enjoy the glory of conquering Athens a ſecond time, Pauſanias, the moſt popular and beloved of the Spartan princes, haſtily levied the domeſtic troops, and a conſiderable body of Peloponneſian allies, and marching through the iſthmus of Corinth, encamped in the neighbourhood of Athens, determined to anticipate and thwart the meaſures of Lyſander. Pauſanias ſent a deputation to the Athenians, to appriſe them that, inſtead of deſtroying their perſons, he wiſhed to protect their liberties; and, fifteen commiſſioners were appointed, who, in conjunction with Pauſanias, were empowered to ſettle the affairs of Athens. With the approbation, or rather by the command, of thoſe miniſters, the Athenian factions ceaſed from hoſtility; the tyrants were diveſted of their power; the foreign garriſon was withdrawn; and the popular government re-eſtabliſhed. This important revolution was remarkable for its ſingular mildneſs. The authors of the moſt oppreſſive uſurpation recorded in the annals of any people, were allowed to retire in ſafety to Eleuſis. Thraſybulus conducted a military proceſſion to the temple of Minerva in the citadel, where the acknowledgments of thanks and ſacrifice were offered to that protecting divinity, who had reſtored the virtuous exiles to their country, and healed the diviſions of the ſtate. The citizens who had been baniſhed, and thoſe who had driven them into baniſhment, joined in this religious duty; after which, convening in full aſſembly, they were addreſſed by Thraſybulus in theſe memorable words:

"The experience of your paſt tranſactions may enable you, men of Athens! to know each other, and to know yourſelves. On what pretence could you, who drove us from the city, abet a tyrannical faction?

Why would you have enſlaved your fellow-citizens? On what ſuperiority of merit could you found your claim of dominion? Is it that you are moſt honeſt and virtuous? Yet the people whom you inſulted never relieved their poverty by unjuſt gain; whereas the tyrants, whom you ſerved, increaſed their wealth by the moſt oppreſſive rapacity. Is it that you are more brave and warlike? Yet this injured people, alone and unaſſiſted, and almoſt unarmed, have overcome your ſuperior numbers, reinforced by the Lacedæmonian garriſon, the powerful ſuccours of Pauſanias, and the experienced mercenaries of Lyſander. As you muſt yield the prize both of probity and of proweſs, ſo neither can you claim the honour of ſuperior prudence and ſagacity. You have been not only conquered in war, but overcome in negociation, by the people whom you deſpiſed; to whom your Lacedæmonian maſters have delivered you, like biting curs, bound and muzzled, to be juſtly puniſhed for your unprovoked inſolence and audacity. But as to you, my fellow-ſufferers and fellow-exiles! you, who ſhared the hardſhips of my baniſhment, and who now ſhare the triumph of my victorious return, I exhort you to forgive and forget our common injuries. Let the dignity of your ſentiments adorn the ſplendour of your actions. Prove yourſelves ſuperior to your enemies, not only in valour but in clemency, that moderation may produce concord, and concord ſtrength."

The effect of this generous enthuſiaſm, excited and diffuſed by Thraſybulus, appeared in a very extraordinary reſolution of the aſſembly. During the uſurpation of the Thirty, an hundred talents had been borrowed from the Lacedæmonians, to ſupport the rigorous cruelty of a government which had baniſhed five thouſand, and put to death, untried, fifteen hundred citizens. The repayment of this ſum was not to be expected from the people at large, againſt whoſe intereſt and ſafety it had been ſo notoriouſly employed. Yet the Athenians unanimouſly reſolved, on this occaſion, that the money ſhould be charged indiſcriminately on them all. This unexampled generoſity might have encouraged even the enfeebled party of the tyrants to return from Eleuſis. But they were too ſenſible of their guilt to expect forgiveneſs or impunity. Having fortified their inſecure reſidence, in the beſt manner that their circumſtances could permit, they began to prepare arms; to collect mercenaries; and to try, anew, the fortune of war. But their unequal hoſtility, the effect of rage and deſpair, was eaſily defeated by the vigour of the new republic. The moſt obnoxious leaders ſealed, with their blood, the ſafety of their adherents, who ſubmitted to the clemency of Thraſybulus. That fortunate and magnanimous commander generouſly undertook their cauſe, and obtained a decree of the people for reſtoring them to the city, for reinſtating them in their fortunes and privileges, and for burying in oblivion the memory of their paſt offences. The aſſembly even ratified, by oath, this godlike amneſty, of which both the idea and the name have been adopted by moſt civiliſed nations, and extolled by all hiſtorians, ancient and modern.

It were well for the honour of Athens, if none but the cruel abettors of an ariſtocratical faction had experienced the unjuſt rigour of its tribunals. But among the firſt memorable tranſactions, after the re-eſtabliſhment of democracy, happened the trial and condemnation of Socrates; a man guiltleſs of every offence but that of diſgracing, by his illuſtrious merit, the vices and follies of his contemporaries. His death ſealed the inimitable virtues of his uſeful life; it ſeemed to be beſtowed as a favour, not inflicted as a puniſhment; ſince, had Socrates, who had already paſſed his ſeventieth year, yielded to the decays of nature, his fame would have deſcended leſs ſplendid, certainly more doubtful, to poſterity. In the phrenzy of their perſecution, they condemned him to die by the bitter cup of hemlock. But this perſecution of philoſophy was accidental and tranſient. Mingled ſentiments of pity, ſhame, and reſentment, ſoon gave a new direction to the popular fury, which raged with more deſtructive, yet far juſter, cruelty, againſt the accuſers and judges of Socrates. Many were driven into exile; many were put to death; ſeveral periſhed by their own hands. The illuſtrious ſage was honoured by ſignal monuments of public admiration; his fame, like the hardy oak, derived vigour from years; and increaſed from age to age, till the ſuperſtition of the Athenians at length worſhipped, as a god, him whom their injuſtice had condemned as a criminal.—See the article SOCRATES.

The operations of war now again conſpired with the revolutions of government, to connect the tranſactions of Greece with the annals of the Perſian empire. The ſame memorable year which terminated the Peloponneſian war, brought to a concluſion the active reign of Darius Nothus. He named as his ſucceſſor Artaxerxes, ſtyled Mnemon, from the ſtrength of his memory; and perſiſted in this choice, notwithſtanding the oppoſition of the artful Paryſatis, who employed all her influence to obtain the kingdom for Cyrus, the younger brother of Artaxerxes, and the peculiar favourite of his mother. The rivalſhip of the young princes, both of whom were at court during the laſt illneſs of Darius, unhappily degenerated into enmity; and a circumſtance, which would be thought immaterial in the preſent age, increaſed the indignation of Cyrus. The birth of Artaxerxes had happened before the acceſſion of his father to the throne, but Cyrus was born the ſon of a king; a diſtinction which, however frivolous it may appear in modern times, had engaged Darius Hyſtaſpes to prefer Xerxes, the younger of his ſons, to his elder brother Artabazanes.

The magnanimity of Cyrus naturally impelled him into the road of danger and glory; he immediately prepared to uſurp the throne of Artaxerxes though defended by a million of Perſian ſoldiers. But the generous ardour and liberal ſentiments of Cyrus acquired him the firm attachment and willing obedience of all his barbarian ſubjects, in the populous provinces which he commanded in his own right, and whoſe united ſtrength exceeded an hundred thouſand fighting men. This armament, aſſiſted by the Greeks, encouraged Cyrus to undertake a grand expedition for acquiring the empire of the Eaſt. By a variety of important ſervices he had deſerved the gratitude of the Lacedæmonian republic; which had been raiſed, chiefly by his aſſiſtance, to the firſt ſtate in Greece, and to the ſovereignty of the ſea.

In return for that favour, the Spartans readily complied with his requeſt, by ſending into Aſia eight hundred heavy-armed men, under the command of the intrepid Cheiriſophus; and they charged their admiral, Samius, who had ſucceeded Lyſander in the government of the Ionian coaſt, faithfully to co-operate with Cyrus, by employing his powerful fleet in whatever ſervice the Perſian prince might think proper to recommend. Had they done nothing more than this, Cyrus might well have praiſed their generous gratitude; but the friendſhip of the Spartans carried them ſtill farther. They allowed him to recruit his forces in every part of their dominions; and the liberal munificence of Cyrus had acquired numerous partiſans well qualified to raiſe and to command thoſe valuable levies. Clearcus the Spartan, Menon the Theſſalian, Proxenus the Bœotian, Agias the Arcadian, and Socrates the Acæan, all alike devoted to the intereſt and glory of the Perſian prince, collected, chiefly from their reſpective republics, above ten thouſand heavy-armed men, and near three thouſand archers and targeteers.

In the beginning of the year 400 before Chriſt, Cyrus marched from the Ionian coaſt into Upper Aſia, at the head of an hundred thouſand barbarians, and about

thirteen thouſand Greeks. His journey towards Babylon, his defeat and death in the plain of Cynaxa, the diſperſion of his followers, and the memorable retreat of the Greeks to their native country, have been related by the admired diſciple of Socrates, with ſuch deſcriptive beauty, with ſuch profound knowledge of war and of human nature, and with ſuch inimitable eloquence, as never were re-united in the work of any one man but that of Xenophon the Athenian. The retreat was principally conducted by Xenophon himſelf; which has enabled him to adorn his narrative with ſuch an affecting variety of incidents and characters, as will always ſerve to prove that the force of truth and nature is far ſuperior to the powers of the moſt fertile fancy. For particulars of this very intereſting expedition of the Greeks into Babylonia, ſee the article ATTICA, vol. ii. p. 527–530.

Trebizond, one of the ancient Greek colonies, was the firſt friendly city at which the Grecians arrived, after ſpending more than a twelvemonth in almoſt continual travelling and war. The numerous inhabitants of this once flouriſhing ſea-port, now decayed into the neglected harbour of Platana, received them with open arms, generouſly ſupplied their neceſſities, and treated them with all the endearing hoſpitality of kinſmen, who commiſerated their ſufferings and admired their virtue. The Grecians, on their part, diſplayed a very becoming ſenſe of the evils which they had eſcaped, and of their actual ſecurity. In the fervour of religious gratitude, they paid the ſolemn vows and ſacrifices which they had promiſed to Jupiter the Preſerver, and the other gods and heroes, whoſe bountiful protection had hitherto conducted them through ſo many known and ſo many concealed dangers. It might be expected, that the army, having reached the country of their friends and kinſmen, ſhould have been diſpoſed peaceably to enjoy the fruits of their paſt labours and dangers. But it is more eaſy for men to repel the aſſaults of external violence, than to elude the effects of their own ungovernable paſſions. The Greeks were involved in real danger, in proportion as they attained apparent ſecurity. During the long courſe of their laborious journey, the terror of unknown barbarians hanging over them, maintained their diſcipline and their union. But the air of a Grecian colony at once diſſolved both. They, who in remote regions of the Eaſt had acted with one ſoul, and regarded each other as brethren, again felt the unhappy influence of their provincial diſtinctions. The army was divided by ſeparate intereſts, as well as by partial attachments. Thoſe who had acquired wealth, deſired to return home to enjoy it. Thoſe who were deſtitute of fortune, longed to plunder friends and foes, Greeks and barbarians. The commanders deſpiſed and deceived the troops; the troops clamoured againſt, and inſulted, the commanders. Both were really in the wrong; and both ſuſpected and accuſed each other of imaginary crimes, of which none were guilty.

Xenophon, who, with wonderful addreſs, has juſtified himſelf from every reproach that can reflect either on his underſtanding or his heart, does not deny an imputation to which he was expoſed by diſcovering (ſomewhat, perhaps, unſeaſonbly) the extenſive views of a philoſopher. When he ſurveyed the ſouthern ſhores of the Euxine, covered with tall and majeſtic foreſt-trees, admirably adapted to ſhip-building; when he conſidered the convenience of the harbours, and the productions of the neighbouring territory, conſiſting in flax, iron, and every commodity neceſſary in raiſing a naval power, he was ambitious of eſtabliſhing a new ſettlement, which the numbers, the valour, and the activity, of his followers, muſt ſoon render ſuperior to the other Grecian colonies on the Euxine, or perhaps in any part of Aſia. But this noble deſign, which might have proved ſo uſeful and honourable to the army, was blaſted by the jealouſy of his enemies. Xenophon was reproached with forming projects equally romantic and dangerous; and accuſed of an intention to keep the ſoldiers from home, that they might continue dependent on himſelf, and that he might increaſe his own fame and fortune at the riſk of the public ſafety.

The mutinous and diſtracted ſpirit of the troops rendered all their future meaſures weak and wavering. The terror which they inſpired, and their wants, which it was neceſſary to ſupply, made them very unwelcome gueſts at Cotyora, Sinopè, and Heraclea, at which places they continued ſeveral months, under pretence of waiting for tranſports, but meanwhile plundering the neighbouring country, laying the cities under contribution, and threatening them with burdens that exceeded their faculties. Meanwhile Cheiriſophus had procured ſome veſſels from Anaxibius, the Spartan admiral, but not ſufficiently numerous to tranſport ſo great an army. The ſoldiers thus diſappointed of their hopes, and diſcontented with their commanders, raſhly undertook, in ſeparate bodies, the dangerous journey through Bithynia, a country extending two hundred miles from Heraclea to Byzantium, and totally inhabited by the Thynians, a Thracian tribe, the moſt cruel and inhoſpitable of the human race. In this expedition they loſt above a thouſand men; and the deſtruction muſt have been much greater, had not the generous activity of Xenophon ſeaſonably led his own diviſion to the aſſiſtance of thoſe who had deſerted his ſtandard. Cheiriſophus was ſoon afterwards killed by a violent medicine; and the ſole command devolved on Xenophon; not by appointment, but by the voluntary ſubmiſſion of the troops to his ſuperior mind. He at length taught them to defeat the irregular fury of the Thynians; and, after taking many ſlaves, and much booty, conducted them in ſafety to Chryſopolis, now known by the name of Scutari, and conſidered as the Aſiatic ſuburb of Conſtantinople.

The neighbourhood of Greece ſeemed infectious to the temper of the troops. At Byzantium their mutinous ſpirits were again thrown into fermentation. Cleander, the governor of that city, who had come down to meet them, narrowly eſcaped death during the fury of a military ſedition. Their behaviour rendered them the objects of terror to all the inhabitants of thoſe parts. The Lacedæmonians even dreaded the aſſiſtance of ſuch dangerous allies, though their own countrymen; and Pharnabazus, alarmed for the ſafety of his province, practiſed with Anaxibius, who commanded in the Helleſpont, to allure them, by fair promiſes, into Europe. Gained by the bribes of the Perſian, not only Anaxibius, but his ſucceſſor Ariſtarchus, made propoſals of advantage to the army, which he had not any intention to fulfil. The troops, enraged at this diſappointment, would have attacked and plundered Byzantium, had they not been reſtrained by the wiſdom and authority of Xenophon, who, ſtruggling like a ſkilful pilot againſt the violence of a tempeſt, prevented the execution of a meaſure which muſt have covered them with eternal infamy.

The ſeaſonable remonſtrances of Xenophon ſaved Byzantium; but it is probable that neither the weight of argument, nor the power of eloquence, would have long reſtrained the diſcontented troops from attempting other enterpriſes of a ſimilar nature, if an opportunity had not preſented itſelf of employing their activity in the ſervice of Seuthes, a bold and ſucceſsful adventurer of Lower Thrace. Mæſades, the father of Seuthes, reigned over the Melandeptans, the Thynians, and the Thranipſans, who inhabited the European ſhores of the Propontis and Euxine ſea. The licentious turbulence of his ſubjects had driven him from his dominions. He took refuge with Medocus, king of the Odryſians, the moſt powerful tribe in Upper Thrace, with whoſe family his own had long been connected by the ſacred ties of hoſpitality. Medocus kindly received, and generouſly

XENOPHON.

London, Published as the Act directs, Jan.ry 10th 1807, by J. Wilkes

nerouſly entertained, the father; and, after his deceaſe, continued the ſame protection and bounty to his ſon, Seuthes. But the independent ſpirit of the young prince diſdained, as he himſelf expreſſes it, "to live like a dog at another man's table." He deſired horſes and ſoldiers from Medocus, that he might acquire ſubſiſtence for himſelf. His requeſt was granted; his incurſions were ſucceſsful; the terror of his name filled all the maritime parts of Thrace; and there was reaſon to believe that, if he could join the Grecian forces to his own, he might eaſily regain poſſeſſion of his hereditary dominions. For this purpoſe he ſent to Xenophon Medoſades, a Thracian, who, underſtanding the Greek language, uſually ſerved him as ambaſſador. The terms of the treaty were ſoon agreed on. Seuthes promiſed each ſoldier a cyzicene, (about eighteen ſhillings ſterling,) the captains two cyzicenes, and the generals four, of monthly pay. The money, it was obſerved, would be clear gain, as they might ſubſiſt by plundering the country.

Having communicated their deſigns to the army, the Grecian commanders followed Medoſades to the camp of Seuthes, which was diſtant about ſix miles from the coaſt of Perinthus, a city of conſiderable note in the neighbourhood of Byzantium. They arrived after ſunſet, but found the barbarians awake and watchful. Seuthes himſelf was poſted in a ſtrong tower; horſes ready bridled ſtood at the gate; large fires blazed at a diſtance, while the camp itſelf was concealed in darkneſs. The Greeks were permitted to enter. Seuthes received them with ruſtic hoſpitality; before entering on buſineſs, challenged them to drink in large horns full of wine; then confirmed the promiſes of his ambaſſador; and ſtill farther allured Xenophon by the hopes of receiving, beſides the ſtipulated pay, lands and cattle, and an advantageous eſtabliſhment on the ſea-ſhore. Seuthes knew how far to indulge, and when to reſtrain, the joys of feſtivity. Without allowing his revels to diſturb the ſtillneſs of the night, he roſe with a martial ſhout; and addreſſing the Grecian captains, deſired them to have their men ready to march in a few hours, that the enemy, who were as yet unacquainted with the powerful reinforcement which he had received, might be taken unprepared, and conquered by ſurpriſe.

The camp was in motion at midnight; it was the middle of winter, and the ground was in many parts covered with a deep ſnow. But the Thracians, clothed in ſkins of foxes, were well prepared for ſuch nocturnal expeditions. The Greeks ſuffered much by the cold; but the rapidity of their march, animated by the proſpect of ſucceſs, made them forget their ſufferings. Wherever they arrived, the villages were attacked and plundered, the houſes were burned, many captives and cattle were taken, and the ravages of that bloody night ſufficiently repreſent the uniform ſcene of cruelty, by which, in the courſe of a few weeks, Seuthes compelled into ſubmiſſion the inhabitants of that fertile and populous ſlip of land that lies between the Euxine and Propontis. But the poſſeſſion of this territory, which formed the moſt valuable portion of his hereditary dominions, could not ſatisfy his ambition. In the ſpace of two months after his junction with the Greeks, Seuthes extended his poſſeſſions ſeveral days march from the ſea; his numerous but unſkilful enemies, fighting ſingly, were ſucceſſively ſubdued; each vanquiſhed tribe increaſed the ſtrength of his army; the Odryſians, allured by the hopes of plunder, flocked to his ſtandard, and the growing proſperity of his fortune, no longer requiring the ſupport, diſpoſed him to neglect the ſervices, of his Grecian auxiliaries. The ungrateful levity of the barbarian was encouraged by the perfidious counſels of his favourite Heraclides, who ſtrongly exhorted his maſter to defraud the Greeks of their pay, and to deliver himſelf from their troubleſome importunities, by diſmiſſing them from his ſervice. But the fears, rather than the delicacy, of Seuthes, prevented him from complying with this advice; he loſt his honour without ſaving his money; and the Grecian generals had an early opportunity to reproach his perfidy and ingratitude, being ſoon called to engage in a more honourable war, kindled by the reſentment of Artaxerxes againſt the preſumption of the Spartans, who had ſo ſtrenuouſly ſupported the unfortunate rebellion of Cyrus.

Without any formal declaration of war, which the late hoſtilities in the Eaſt ſeemed to render unneceſſary, Tiſſaphernes, by order of the Perſian king, attacked the Æolian cities; and Pharnabazus readily, entering into his views, zealouſly concurred with all his meaſures. The Lacedæmonian garriſon, ſupported by the townſmen, defended themſelves with their uſual courage, earneſtly ſoliciting, however, a reinforcement from home, which might enable them to ſurmount ſuch an unexpected danger. On this occaſion, the Spartan ſenate were not wanting to the aſſiſtance of their garriſons, or to the hopes of their Æolian allies. They immediately levied a body of five thouſand Peloponneſian troops, and demanded a conſiderable ſupply from the Athenians. The latter ſent them three hundred horſemen, who having ſerved under the thirty tyrants, were cheerfully ſacrificed to this dangerous duty by the partiſans of the new democracy. The command of the joint forces was entruſted to the Spartan Thimbron, who had orders, as ſoon as he arrived in Æolis, to take into pay the Greeks who had returned from the expedition of Cyrus, and who were then employed in the diſhonourable ſervice of an ungrateful barbarian. The mean and perfidious behaviour of Seuthes, who, in his new character of prince, ſtill retained his original manners of a Thracian robber, rendered the propoſal of joining Thrimbron extremely agreeable to Xenophon, who conducted to the Lacedæmonian ſtandard ſix thouſand men, the venerable remains of an army exhauſted and ennobled by unexampled toils, and unexampled and unimitated perſeverance.

With this powerful reinforcement Thimbron opened the campaign againſt the lieutenant of Artaxerxes, at the diſtance of two years after Cyrus had marched from Epheſus to diſpute the crown of Perſia. The firſt impreſſions of the Grecian arms were attended with conſiderable ſucceſs. Thimbron took the towns of Pergamus, Teuthrania, Haliſarnia, Myrina, Cymè, and Grynium. But the walls of Lariſſa, a ſtrong city in the Troade, defied his aſſault: the vigilant garriſon baffled all his contrivances for depriving them of freſh water; and, aſſiſted by the inhabitants of the place, made a vigorous ſally, repelled the beſiegers, and burned or demoliſhed their works.

Nothing but continual action, and an uninterrupted career of victory, could reſtrain the licentious paſſions of the troops, compoſed of a motley aſſemblage from ſo many different communities. Their ſeditious ſpirit rendered them formidable to each other, and to the Greeks of Aſia. Their rapacity ſpared not the territories of the Lacedæmonian allies, who loudly complained to the ſenate, aſcribing the violence of the troops to the weakneſs of the general. In conſequence of this repreſentation, Thimbron was recalled and diſgraced, and the command, for which he ſeemed ſo ill qualified, was beſtowed on Dercyllidas, a man who, to the talents of an able general, added the reputation of being the beſt engineer of his times. By a judicious direction of the machines of war which he invented, or improved, Dercyllidas overcame the obſtinacy of Lariſſa; and, in the ſpace of eight days, reduced eight other cities in the province of Pharnabazus. The rapidity of his conqueſts recommended him to the Spartan ſenate, and his moderate uſe of victory endeared him to the Aſiatic colonies. He leſſened their taxes, encouraged their induſtry, heard their complaints with candour, and decided their

differences with the moſt impartial juſtice. Diſdaining the cruel example of his predeceſſors, he impoſed not any arbitrary exactions on the peaceful citizens and huſbandmen; and, leſt the maintenance of his troops ſhould prove burdenſome to the allies and ſubjects of Sparta, he fixed his winter-quarters in Bithynia, where the valour of Xenophon and his followers had lately ſpread the terror of the Grecian name.

Early in the ſpring, commiſſioners were ſent from Sparta, to inſpect the affairs of Aſia, and to re-appoint, for another year, the authority of Dercyllidas, provided their obſervations and inquiries confirmed the very favourable accounts that had been given of his adminiſtration. Dercyllidas had ſcarcely reſumed the command, when the combined forces of Pharnabazus and Tiſſaphernes appeared in the neighbourhood of Epheſus. The general collected his whole ſtrength in order to give them battle; the European ſoldiers diſplayed a noble ardour for action; but the inhabitants of the Aſiatic coaſt, who had flocked to his ſtandard, were intimidated by the ſight of an enemy whoſe numbers far exceeded their own. This panic might have proved fatal, had not the troops of Tiſſaphernes felt the ſame terror which they themſelves inſpired. They recollected the bravery of the ten thouſand who accompanied Cyrus; they perceived that the forces with whom they now had to contend exceeded that number; but they did not reflect that the army of Dercyllidas was ſwelled by the degenerate Greeks of Æolis and Ionia, whoſe minds had been enfeebled and degraded by a long ſeries of oppreſſion. The cowardice of the Perſians engaged Tiſſaphernes, much againſt the inclination of Pharnabazus, to propoſe a conference; the cowardice of the Ionians engaged Dercyllidas to accept the propoſal. Hoſtilities were thus ſuſpended; mutual hoſtages were given; overtures of peace were made; and meſſengers were diſpatched for inſtructions to the Spartan council, and to the court of Perſia.

The deſign of Tiſſaphernes, however, was only to gain time by amuſing the enemy. The moſt ſolemn engagements had long loſt their power over his perfidious mind. He treacherouſly watched an opportunity to renew the war, waiting with impatience for reinforcements from the Eaſt, and eſpecially for the equipment of a fleet, which Artaxerxes was preparing in the ports of Phœnicia. Theſe ſecret preparations were communicated to Sparta by the diligence of Herodas. The Spartan ſenate were alarmed with the danger, indignant at the treachery of Tiſſaphernes, and diſpleaſed with the too eaſy credulity of their general. But the death of Agis had given them, in the perſon of their firſt magiſtrate, a commander who equalled Dercyllidas in merit, and who far ſurpaſſed him in renown.

The memorable expedition againſt the Eleans was the laſt exploit of the long and warlike reign of Agis. On his death-bed he acknowledged for his ſon Leotychides, whoſe legitimacy the levity or the guilt of his mother Timea had expoſed to juſt ſuſpicion. But this late avowal of a ſucceſſor, whom he had ſo long diſowned, did not ſatisfy the partiſans of Ageſilaus, who was the brother of Agis on the ſide of his father Archidamus, but younger by many years, being born of a different mother, and, except Leotychides, the neareſt heir to the throne. Under a diminutive and ignoble form, Ageſilaus concealed a vigorous and fervid mind, a manly elevation of character, a generous and noble ſoul. Theſe high qualities, adorned by the milder virtues of modeſty, candour, and condeſcenſion, eaſily attracted the notice, and merited the eſteem, of the firſt ranks in Sparta; and of none more than Lyſander, who, as his own perſonal hopes of grandeur were blaſted, confined his ambition to the aggrandiſement of his friend. That eloquence and addreſs, which would have been ineffectual if employed for himſelf, ſucceeded in behalf of another; and by the influence and intrigues of Lyſander, Ageſilaus was declared ſucceſſor to the vacant throne; and thus became commander in chief of the Greek forces in Aſia.

In the interval of theſe ſucceſſive honours, he approved his attentive vigilance in the ſervice of the republic, of which the ſafety, and even the exiſtence, was endangered by a daring and bloody conſpiracy. A youth named Cinadon, diſtinguiſhed above his companions by extraordinary ſtrength and agility, was not leſs conſpicuous for undaunted courage and ambition. Deſcended of an obſcure family, Cinadon felt and regretted the mortifying partiality of the government under which he lived. His pride was deeply wounded with the reflection, that whatever abilities his youth might promiſe, and his manhood mature, the unfortunate circumſtances of his birth muſt for ever exclude him from the principal dignities of the ſtate, which circulated among a few Spartan families, without the poſſibility of being extended beyond that very limited ſphere. The warmth of his character, and the impetuoſity of his paſſions, prompted him to ſeek revenge: nor was his headlong ferocity alarmed by the means, however atrocious, that muſt lead to this favourite end. He communicated the horrid deſign to men of his own and of an inferior condition, exaggerating their cruel oppreſſion under a ſtern ariſtocracy, which he contraſted with the mild equality of the neighbouring communities; aſſerting, that even the ſubjects of a monarchy enjoyed greater equality and liberty than the members of the Spartan republic, ſince the former all equally participated in thoſe preferments and honours, to which not only the ſlaves, the Helots, and freedmen, but the whole body of the Lacedæmonian people, were forbidden to aſpire: nor did he forget to encourage them all with the certain proſpect of ſucceſs, by contraſting their own ſtrength and numbers with the weakneſs of an enemy, who might be taken unarmed, and cut off by ſurpriſe.

The time for action approached, and the author of the conſpiracy commanded his aſſociates to be ready at a certain call. Ageſilaus, meanwhile, performed the accuſtomed vows and ſacrifices for the ſafety of the republic; ſoon after which one of the conſpirators denounced Cinadon to the magiſtrates, as guilty of a treaſonable deſign, of which he had promiſed to become an accomplice. He told them, that Cinadon having conducted him to the great ſquare of the city, which being deſtined for the public aſſembly, was the uſual place of rendezvous, deſired him to count the number of Spartans whom he ſaw in that ſpacious reſort. That he counted the king, the ephori, the ſenators, and about forty others, and then aſked Cinadon, for what purpoſe he had required him to take that trouble? Becauſe, replied the conſpirator, I reckon the Spartans to be enemies, and all the reſt, whoſe great numbers you behold in the market-place, to be friends. Nor does this proportion apply to Sparta only; in the farms and villages adjacent to the city, we ſhall in each houſe and family have one enemy, the maſter, but all the ſervants will be our friends. Cinadon then acquainted him with the object and cauſe of the conſpiracy, which had been formed by men of probity and fortitude, and which was ſoon to be communicated to the ſlaves, peaſants, and the whole body of Lacedæmonian people, whoſe animoſity againſt the Spartans was too violent to be concealed. That the greateſt part of the conſpirators, being trained for war, had arms in their hands; that the ſhops of the armourers, the tools of thoſe artificers who wrought in metal, wood, and ſtone, and even the inſtruments of agriculture, might furniſh ſuch weapons to the reſt. This alarming intelligence rouſed the activity of the Spartan magiſtrates. It would have been imprudent to ſeize Cinadon in the capital, as they were unacquainted with the number of his aſſociates. On pretence of the public ſervice, they contrived to ſend him to Aulon (for in ſimilar expeditions they had often employed

employed his enterprising valour), that he might seize, in that licentious city, and bring within the reach of justice, several daring violators of the Spartan laws. The senate prepared waggons for conveying the prisoners, and furnished every thing necessary for the journey. A body of chosen horsemen was appointed to accompany Cinadon, who set out without suspecting that this long train of preparation was destined against himself. But no sooner had he reached a proper distance from the city, than he was seized as a traitor, and compelled, by the terror of immediate death, to discover his accomplices. Their names were sent to the senate, who instantly secured their persons. Cinadon, Tisamenes, a priest, and the other leaders of the conspiracy, were scourged through the city, gored with instruments of torture, and finally put to death.

The alarm occasioned by this rash enterprise of Cinadon had scarcely subsided, when intelligence arrived of the formidable preparations of Artaxerxes; against whom the persuasive influence of Lysander encouraged them to employ the heroic abilities of their young prince, Agesilaus. In the spring of the year 396 before Christ, he left Sparta, with three thousand Lacedæmonian freedmen, and a body of foreign troops, amounting to six thousand, chiefly collected from the confederate cities of Peloponnesus. Since the irregular and supine conduct of Agis, in his expedition against Argos, the Spartan kings were usually attended in the field by a council of ten senators, whose concurrence was held necessary in all public measures. Agesilaus demanded a council, not of ten, but of thirty, Spartans: a refined stroke of policy, which strongly indicates that artful dexterity with which, during a long administration, he uniformly promoted the views of his interest and ambition. By augmenting the number of the council, he diminished its importance. Each member, possessing less weight and influence, felt himself less concerned in the honour of the body; and the whole were more easily swayed and governed by the king. Lysander alone, whose name in Asia was illustrious or terrible, rivalled for a while the power of Agesilaus. But the colleagues of Lysander were the first to dispute his pretensions, and to controul his authority. Agesilaus availed himself of their envy, and listened to the dictates of selfishness, in humbling the arrogance of a man who had been the chief author of his own greatness. After a disgraceful rupture, which ended in an affected reconciliation, Lysander was sent by Agesilaus and his council to command the Lacedæmonian squadron in the Hellespont, an inactive and subordinate service, in which he could not expect an opportunity of performing any thing worthy of his ancient fame. He returned, therefore, in a few months to Sparta, covered with disgrace, and vowing implacable revenge against the cruel ingratitude of his friend, which he felt more deeply than the injustice of all his enemies together.

Agesilaus fixed his head-quarters at Ephesus; and thither Tissaphernes sent an embassy, demanding the reason of such mighty preparations. Agesilaus replied, "That the Greeks in Asia might enjoy the same liberty with their brethren in Europe." The messengers of Tissaphernes had orders to declare, that the great king was inclined to acknowledge the ancient freedom and independence of the Grecian colonies; that the report of his hostile intentions against either them or the mother-country was totally void of foundation; and that, in consequence of the recent transactions between Tissaphernes and Dercyllidas, ambassadors might shortly be expected from Susa, empowered to ratify a firm and lasting peace between Artaxerxes and the Greeks. Until this desirable work should be completed, Tissaphernes earnestly desired a continuation of the truce, which, on his side, he was ready to seal by whatever formalities Agesilaus thought proper to require. The Spartan king frankly avowed his suspicions of treachery; yet, unwilling to embroil his country in an unnecessary war, he dispatched Dercyllidas, with two members of the Spartan council, to renew his late engagements with Tissaphernes. The perfidious satrap now deceived for the last time. No sooner had he received the long-expected auxiliaries from the East, than he commanded Agesilaus to leave Ephesus, and to evacuate the coast of Asia; if he delayed to comply, the weight of the Persian arms would enforce obedience. The prudent Spartan, while his friends were alarmed with this unexpected declaration, assumed an unusual gaiety of countenance, observing, that he rejoiced to commence the war under such favourable auspices, since the treachery of Tissaphernes must render the gods his enemies.

Meanwhile he prepared to encounter the insidious arts of the satrap with equal address. It was industriously given out, that he intended to march into the province of Caria, the favourite residence of Tissaphernes, which was adorned by his voluptuous parks and palaces, and strengthened by a fortress, the repository of his treasures. The intervening cities were ordered to mend the roads, to furnish a market, and to prepare every thing necessary to facilitate the march of the Grecian army. Tissaphernes, not doubting that Caria was the intended scene of war, encamped with his numerous cavalry in the plains of the Meander, in readiness to intercept the passage of the enemy. But Agesilaus, having posted a sufficient garrison in Ephesus, left that city, and turning to the north, advanced by rapid marches into Phrygia, the rich plunder of which rewarded the active diligence of his soldiers. The selfish satrap was unwilling to relieve the province of Pharnabazus, by weakening the defence of his own; and accordingly remained inactive, still suspecting an invasion of the Greeks from Ephesus and the neighbouring seaports. During the greatest part of the summer Agesilaus ravaged Phrygia; the barbarians were totally defeated in several rencounters; and the victorious Greeks returned, loaded with spoil, to winter in Ephesus.

In the Phrygian expedition, Agesilaus shared, and surpassed, the toils of the meanest soldier, from whom he refused to be distinguished by his dress, his food, or his comforts by day or night. The inactive season of the year was most diligently and usefully employed. Ephesus and the neighbouring towns glowed with the ardour of military preparation. The Phrygian wealth was employed to urge the hand of industry. Shields, spears, swords, and helmets, filled every magazine; and the inhabitants of the country were allured by great rewards to form their best horses to the discipline of the field. The expectation of Xenophon, who beheld these interesting scenes at Ephesus, was fully gratified by the success of the ensuing campaign. Agreeably to the annual revolution of offices in the Lacedæmonian republic, a commission of thirty Spartans was sent early in the spring to supply the place of Lysander and his colleagues. Among the members of this new council Agesilaus distributed the various departments of military command. The superior abilities of Herippidas were entrusted with the veteran army which had served under Cyrus. Xenocles was appointed to conduct the cavalry. Mygdo commanded the Asiatic levies; Scythes, the Lacedæmonian freedmen; for himself, as his peculiar care, the general reserved the faithful and warlike body of Peloponnesian allies, chosen from the flower and vigour of many flourishing republics.

Agesilaus now declared, that he would be no longer satisfied with ravaging the extremities, but was determined to attack the centre, of the Persian power. He therefore marched towards the royal city of Sardis, and ravaged the adjoining territory without opposition. After several slight skirmishes, he defeated the Persians in a general engagement on the banks of the Pactolus, surrounded and took their camp, in which, beside other

riches, he found seventy talents of silver. Tissaphernes, after the battle, fortified himself, with a considerable body of troops, in the strong city of Sardis, where he continued, displaying the inglorious pride of pomp and luxury, while the provinces of Artaxerxes fell a prey to the hostile invader. The time of his punishment, however, was arrived. Tithraustes was sent from court to take off the head of the perfidious Tissaphernes, who, being allured to a conference, met with a just fate; although the author of his death was perhaps the only man in Persia with whom Tissaphernes had any claim of merit.

Tithraustes, who had come from Babylon escorted by a powerful body of cavalry, assumed the government of Lower Asia, and the conduct of the war. He immediately sent an embassy to Agesilaus, to declare, "That Tissaphernes, author of those troubles which embroiled Greece and Persia, had suffered a just death; and that the great king, who had been too long deceived by his artifices, was now ready to acknowledge the independence of the Grecian colonies, on condition that Agesilaus withdrew his troops from Asia." The Spartan king replied, "That the alternative of war or peace depended not on himself, but on the resolution of the assembly and senate; nor could he remove his forces from the east without the express command of his republic." The artful satrap, perceiving that it was impossible to interrupt, determined to divert, the course of hostilities. None knew better than Tithraustes the use of money as an instrument of negociation. He condescended to purchase from Agesilaus, by a very large sum, the tranquillity of Lydia; and, as it seemed a matter of indifference to the Spartan king whichever part of the Persian dominions felt the weight of his arms, he evacuated that province, and again entered Phrygia. There Agesilaus attacked, conquered, and pursued, Pharnabazus; who, flying from post to post, was successively driven from every part of his extensive province. The fame of the Grecian victories struck terror into the neighbouring countries. Corylas, the tyrant of Paphlagonia, who disdained the friendship of the great king, sent humbly to request that the native valour of his numerous and invincible cavalry might be associated with the Spartan arms. The inferior satraps, and especially their oppressed subjects, courted the protection of Agesilaus, expecting that the dominion of Greece would be lighter than the yoke of Persia, of which they had long felt and deplored the severity. The commotion became general in Lesser Asia; and, as Egypt had already rebelled, Agesilaus, at the head of about twenty thousand Greeks, and innumerable barbarian allies, might be led to entertain a rational expectation of being able to shake the throne of Artaxerxes; especially as the experience of his friend Xenophon, who was still the companion of his arms, must have powerfully encouraged him to that grand enterprise.

But an undertaking of which the success, however splendid, could not probably have been followed by any solid advantages, was blasted by intelligence equally unexpected and distressful. Tithraustes, who knew the power of gold over the Grecian councils, determined, with the approbation of the king his master, to give full play to this main-spring of politics. The instrument of his negociations was Timocrates of Rhodes, a man of an intriguing spirit, who carried with him no less a sum than fifty talents, (above nine thousand pounds sterling,) which he distributed, with lavish promises of future bounty, to Cyclon of Argos, to Timolaus and Polyanthes of Corinth, to Androclides, Ismenias, and Galaxadorus, of Thebes; names for the most part obscure in the annals of war, but important in the history of domestic faction. The tyranny of Sparta was the perpetual theme of these venal hirelings, not only in their respective communities, but in every quarter of Greece. Strong as these invectives may appear, they did not exceed the truth. Since the subversion of the Athenian power, the imperious government of Sparta had rendered her almost alike odious to her old and to her new confederates. Argos had long been the enemy, and Thebes aspired to become the rival, of Sparta. Above all, the Athenians, animated by the patriotism of Thrasybulus, their deliverer from the Spartan yoke, longed to employ the first moments of returning vigour to redeem their glory and renown.

Yet, notwithstanding the concurring causes which hastened a rupture, such was the terror of the Spartan name, increased by the recent glory of Agesilaus, that none of her numerous enemies had courage openly to take arms, and to avow their just animosity. After various but secret conferences, held in the principal cities, it was determined to wound that republic through her allies, the Phocians, who were distinguished, amidst the general discontent, by their unshaken attachment and fidelity. The Locri Ozolæ, a fierce and insolent people, who lived in the neighbourhood of Phocis, were easily persuaded to levy contributions from a district on their eastern frontier, to which they had not the smallest claim, and of which the dominion had been long a matter of dispute between the Phocians and Thebans. Both these states seem to have been injured, and exactly in the same degree, by this aggression; but the Phocians, who were the enemies of the Locri, took arms to revenge, while the Thebans, who were their friends, prepared to abet, their injustice. They expected that the Spartans would quickly interfere in a quarrel that affected their Phocian allies; a measure which tended precisely to that issue which policy required, since the Thebans would be compelled to arm in their own defence, and must appear to all the neutral states of Greece, and even to their Lacedæmonian enemies, to be undesignedly dragged into the war. Thus the pride of Sparta conspired with the most sanguine hopes of Thebes and her allies. Instead of condescending to remonstrate, or ordering the Thebans to evacuate the territory of Phocis, the Spartans flew to arms, and marched directly to invade Bœotia. On the first rumour of hostilities, the activity of Lysander had been employed to assemble their northern confederates. He penetrated into the Theban territory, gained Lebadea by force, Orchomenus by treachery; and prepared to assault the walls of Haliartus, which, next to Thebes, was the strongest of the Bœotian cities. The difficulty of this enterprise made him dispatch a messenger to hasten the arrival of Pausanias, who had led forth six thousand Peloponnesians, to co-operate with this experienced commander. The unfortunate messenger was taken by the Thebans, with the letter, in which Lysander had signified his purpose, and appointed the time of rendezvous with Pausanias, that they might surprise Haliartus with their combined forces.

Just as this intelligence was brought to Thebes, there arrived in that city a powerful reinforcement of Athenian troops, who, though their own capital was unwalled and defenceless, had been persuaded by Thrasybulus to brave the resentment of Sparta. To these generous auxiliaries the Thebans committed their city, while the warlike youth, and almost all those of a military age, assembled in complete armour, set out in the dead of night, and performing a journey of fifteen miles with silence and celerity, reached, while it was yet dark, the gates of Haliartus. Their unexpected arrival brought salvation to their friends; they sent a strong detachment to lie in ambush without the walls; the rest, reinforced by the townsmen, formed themselves in battle array, and stood to their arms behind the gates. Lysander arrived in the morning; but Pausanias, who had not received his message, still continued in the neighbourhood of Plataea. The soldiers, flushed by recent victory, disdained to wait for their allies, but requested Lysander to lead them against the place. He approached

approached the town, and boldly began the attack, perceiving the walls and battlements to be unguarded. But before any breach was made, the different gates at once flew open, while the Thebans and Haliartians rushed forth with irresistible fury. Lysander, with a priest who attended him, was slain on the first onset. His men began to rally, when the Thebans, posted in ambush without the city, occasioned a new terror. The enemy every where gave way; above a thousand fell in the field of battle, the rest were put to flight, and pursued with great slaughter.

The first intelligence of this defeat brought Pausanias to the scene of action, that he might examine the full extent of the calamity. It would have been fruitless to attempt the siege of Haliartus; but it was necessary to carry off the bodies of the slain. Pausanias held a council of war, and it was unanimously resolved to send a Spartan herald to Haliartus, requesting leave to bury the dead. The demand was granted, on condition that the Peloponnesian army should immediately evacuate Bœotia. Pausanias complied, and returned to Sparta. His want of success, rather than his demerit, subjected him to trial and condemnation. He escaped capital punishment by flying to Tegea, where he soon afterwards died.

The victory at Haliartus, which exasperated the Spartans, confirmed the courage of their enemies, and hastened the defection of their allies. The league was openly ratified and avowed by the republics of Thebes, Argos, Athens, and Corinth. The spirit of revolt seized Eubœa, pervaded the provinces of Acarnania, Leucas, Ambracia, the rich cities of Chalcis, and the warlike principalities of Thessaly. The whole fabric of the Spartan power, raised and cemented by a war of twenty-seven years, began to totter; and Agesilaus was recalled from his Asiatic victories, to sustain the fallen ruins of his country. He received the unwelcome tidings of his recal, at the important crisis of his fortune. He had completed his preparations for marching into Upper Asia, and his heart beat with the ardour of promised conquest and glory. Having assembled the confederates, he communicated the orders of the republic, with which he expressed his resolution immediately to comply. The generous troops, having associated their own honour with the renown of the general, testified their grief and their reluctance by tears and entreaties. But Agesilaus remained firm in his purpose to obey the command of Sparta, to which he was summoned by the danger of his country. The greater part of the army, and particularly the new levies of Ionians and Æolians, who had passed their apprenticeship in arms under his fortunate standard, declared that they would never abandon their beloved general. Agesilaus encouraged this disposition, which was extremely favourable to his views; and lest it might be nothing but a sally of temporary enthusiasm, artfully secured its permanence, by proposing the distribution of valuable rewards, in the Thracian Chersonesus, to such officers as brought the best companies of foot or cavalry for the service of his intended expedition. He was able to perform his promises with a generous munificence; since, after defraying the necessary expences of the war, he carried from Asia above a thousand talents, or a hundred and ninety-three thousand pounds sterling.

When the whole forces were assembled in the Chersonesus, they amounted to about ten thousand men. Their nearest route into Greece lay through the same countries that had been traversed near a century before by Xerxes; but the activity of Agesilaus accomplished in a month what, to eastern effeminacy, had been the journey of a year. Agesilaus descended without resistance into the plains of Thessaly, where his progress was stopped for a moment by the numerous cavalry of that country, whose petty princes had acceded to the alliance formed against the ambition of Sparta. By a judicious disposition of his forces, and by evolutions equally skilful and rapid, he speedily surmounted this obstacle. To the charge of the Thessalian cavalry he opposed the weight of his heavy-armed men, by whom the enemy were routed and put to flight. Then with his own horsemen he pursued them with great slaughter, took many prisoners, and erected a trophy of his victory between the mountains Prantes and Narthacium, which form the western boundary of the extensive plain of Coronæa.

Instead of continuing his journey through the hostile country of Locris, he marched through the friendly territories of Doris and Phocis, that he might turn the shock of the war against the rebellious Thebans. He found them in arms with their powerful allies, rather provoked than discouraged by a bloody but undecisive battle, which, soon after the disaster at Haliartus, had been fought against the Lacedæmonians at Epiecia, a small town on the common frontier of Corinth and Sicyon. The confederate army was still about twenty thousand strong; the forces of Agesilaus fully equalled that number, as he had received some considerable reinforcements. The hostile battalions approached; those of Agesilaus marching, in good order, from the banks of the Cephissus, while the Thebans impetuously descended from the mountains of Helicon. Before they arrived at the scene of action, in the Bœotian plain of Coronæa, a city thirty miles distant from Thebes, the superstition of both armies was alarmed by an eclipse of the sun; but Agesilaus was alarmed, far more justly, by most unexpected intelligence from the East.

Since the Lacedæmonian fleet had been entrusted to Pisander, the Persian and Phœnician squadrons had been committed to a far more able commander. After the decisive engagement at Ægos-Potamos, which was followed by the taking of Athens, and the conclusion of the Peloponnesian war, Conon, the Athenian admiral, escaped with a few gallies into the harbour of Salamis, the capital of the isle of Cyprus. That city, and a considerable part of the island, was then subject to Evagoras, a man whom the voice of panegyric represents as governing, with consummate wisdom, a kingdom which he had acquired by heroic valour. This prince boasted a descent from Teucer, who, returning from the siege of Troy eight hundred years before the reign of Evagoras, had founded the first Grecian colony on the Cyprian shore. During that long space of time, Salamis had undergone various revolutions. Evagoras was born and educated under the reign of an usurper, who fell by the dagger of an assassin, who in his turn assumed the crown. Evagoras fled to Cilicia, obtained the protection of the satrap of that province, returned to Salamis with a handful of men, surprised and dethroned the new tyrant, to whom he was not bound by any tie of allegiance. From the moment that he began to reign, he discovered a partial fondness for Athens, in whose language, arts, and institutions, his youth had been liberally instructed; and which afterwards formed the study and delight of his manhood, the amusement and consolation of his declining age. But unfortunately for the sensibility and gratitude of Evagoras towards a country to which he owed his education and his happiness, he lived at a period when, before the situation of his principality enabled him to afford any effectual assistance to Athens, he beheld that proud republic deprived of the splendour and dominion which she had enjoyed above seventy years. He lamented her misfortunes with a filial tenderness, and received with the kindest hospitality her afflicted citizens. The virtuous and enterprising Conon deserved his affection and esteem, and soon acquired the unlimited confidence of a mind congenial to his own. They acted with the happiest concert for the security and aggrandisement of the little kingdom, alluring new inhabitants from Greece, increasing their arts and industry, extending navigation and

and commerce; and, in a ſhort time, Salamis was able to fit out a conſiderable naval power, and to ſubdue and incorporate with her own ſubjects ſeveral of the neighbouring communities. The great king, who had long been conſidered as lord paramount of Cyprus, interfered not in the domeſtic concerns of the iſland, provided he received from thence his ſmall cuſtomary tribute. The flouriſhing ſtate of Evagoras's affairs might enable him to pay, and to exceed, the ſtipulated ſum; though it is probable that he early meditated, what he afterwards attempted to accompliſh, the deliverance of his country from bondage.

But a deſign which actually engaged him more deeply, and to which he was ſtrongly incited by the ardent ſolicitations of Conon, was the reſtoration of Athens to that ſtate of glory from which ſhe had ſo miſerably fallen. Conon had been already recommended to the great king by Evagoras; and the recommendation had been enforced by Pharnabazus, who knew and admired his merit. The experienced ſkill of the illuſtrious Athenian, and of his countrymen Hieronymus and Nicodemus, had aſſiſted in equipping the barbarian ſquadrons in the Cilician and Phœnician harbours. But the abilities of Pharax the Spartan admiral, and the negligence of the Perſian commanders, hitherto rendered uſeleſs a fleet of near three hundred ſail, which was ill manned, and worſe ſupplied. The activity of Conon undertook to remedy theſe evils. He left Cilicia, in order to procure an interview with the monarch of the Eaſt. Conon repreſented to the trembling monarch, ſtill agitated by the terror of Ageſilaus's victories, the neceſſity of oppoſing the Spartans vigorouſly by ſea. Their fleet alone had acquired and maintained the command of the Aſiatic coaſt. A ſingle defeat at ſea would excite their allies to revolt, and drive their armies from Aſia. But to obtain this advantage, the great king muſt employ an admiral worthy to command, and men willing to obey. In looking for the firſt, the valour of Pharnabazus could not eſcape his notice. The ſecond might be obtained by money. And ſhould Artaxerxes entruſt him with the requiſite ſum, he pledged his life that he would ſoon collect ſuch a number of ſailors as would enable him to defeat the fleet of Sparta, and compel that republic to abandon her eaſtern conqueſts. The propoſal pleaſed Artaxerxes, the money was raiſed, and Conon returned to Cilicia to accompliſh the undertaking.

From various ſea-ports of Aſia, but chiefly from the powerful iſlands of Rhodes and Cyprus, he ſoon collected a naval force exceeding his moſt ſanguine hopes. With their combined ſtrength, Conon and Pharnabazus ſailed weſtward in queſt of the hoſtile fleet, perſuaded that the raſh confidence of the Spartan admiral would not decline battle with a ſuperior enemy. As the united armament doubled the northern point of Rhodes, they perceived the Lacedæmonian ſquadron, amounting to near an hundred gallies, in the capacious bay which is formed between the projections of the Dorian ſhore, and the ſmall iſlands called Sporades, from the careleſs irregularity with which they ſeem to have been ſcattered by the hand of nature. The unexpected approach of ſuch a formidable fleet did not ſhake the ſullen obſtinacy of Piſander. He commanded his men to prepare for battle. They bore up againſt the enemy, but on a nearer ſurvey were alarmed and terrified with the great diſproportion of numbers. Piſander advanced in the admiral galley, and died fighting bravely in defence of the Spartan honour, vainly endeavouring to maintain by the vigour of his arm what had been betrayed by the weakneſs of his counſels. The victors purſued; and after deſtroying great numbers of the enemy, took and carried into port fifty galleys.

It was the intelligence of this victory that alarmed and afflicted the patriotic breaſt of Ageſilaus. He aſſembled the troops, honeſtly confeſſed the death of Piſander, but artfully declared that, though the admiral was ſlain, his fleet was victorious. This ſtratagem was attended with a very ſalutary effect; for in a ſkirmiſh between the advanced guards, immediately preceding the battle, the Lacedæmonian troops, animated by their imagined victory in the eaſt, defeated and repelled the enemy. Meanwhile the main bodies of either army advanced into the plain of Coronæa, at firſt in awful ſilence; but having approached within a furlong of each other, the Thebans raiſed an univerſal ſhout, and ran furiouſly to the charge. Their impetuoſity bore down every thing before them; but the troops immediately commanded by Ageſilaus repelled the left wing of the enemy, chiefly conſiſting of Argives and Athenians. Already thoſe who ſurrounded his perſon ſaluted him as conqueror, and adorned him with the crown of victory; when it was told, that the Thebans had broke and totally routed the Orchomenians, and were advancing to ſeize the baggage. Ageſilaus, by a rapid evolution, prepared to intercept them, in order to fruſtrate this deſign. The Thebans perceived this movement, wheeled about, and marched in an oppoſite direction, that they might join and rally their allies, who fled towards the mountains of Helicon. In the rencounter which followed, Xenophon is diſpoſed to admire rather the valour than the prudence of the Spartan king. Inſtead of allowing the Thebans to paſs, that he might attack their rear and flanks, he boldly oppoſed their progreſs, and aſſailed their front. The ſhock was terrible; their ſhields, meeting, claſhed; they fought, flew, and were ſlain. No voice was heard, yet none was ſilent; the field reſounded with the noiſe of rage and battle; and this was the moſt deſperate and bloody action of any in that age. At length the firmneſs of the Thebans effected their long-attempted paſſage to Helicon; but could not encourage their allies to renew the engagement.

Ageſilaus had received ſeveral wounds, yet did he not ſhrink from the battle in the moment of victory. When informed that about fourſcore of the enemy had taken refuge in the neighbouring temple of Minerva, he religiouſly reſpected the right of ſanctuary, ordered his ſoldiers to abſtain from hurting them, and even appointed a body of horſe to conduct them to a place of ſecurity. The next day was employed by the victors in erecting a trophy on the ſcene of this important action; while the enemy acknowledged their defeat, by requeſting the bodies of the ſlain. Notwithſtanding his fatigue and wounds, Ageſilaus travelled to Phocis, that he might dedicate the tenth of his ſpoil in the temple of Delphian Apollo. Having returned towards the Peloponneſus, he diſbanded his eaſtern troops, moſt of whom were deſirous to reviſit their reſpective cities; his Peloponneſian and Lacedæmonian forces inclined alſo to return home, that they might reap the fruits of harveſt; and Ageſilaus, probably to avoid a journey painful to his wounds, ſailed to Sparta, to join in the celebration of the Hyacinthian feſtival.

The ſea-fight of Cnidus, and the battle of Coronæa, were the moſt important and deciſive actions in the Bœotian or Corinthian war, which laſted eight years; namely, from the year 394, to the year 387, before Chriſt; and it is worthy of obſervation, that the partial actions, which happened on either element, generally followed the bias of thoſe important victories. Succeſs for the moſt part attended the ſailors of Athens, and the ſoldiers of Sparta; though the naval exploits of Teleutias, the kinſman of Ageſilaus, who ſurpriſed the Piræus with twelve galleys, took many merchantmen, deſtroyed ſeveral ſhips of war, and ſcoured the coaſt of Attica, formed an exception extremely honourable to that commander; and the military advantages of Iphicrates the Athenian, though unimportant in their conſequences, announced thoſe great talents for war, which afterwards rendered him ſo illuſtrious. But, in general, Ageſilaus

and the Spartans maintained their ſuperiority in the field; while Conon, Thraſybulus, and Chabrias, proved ſucceſsful againſt Thimbron, Anaxibius, and the other naval commanders of the enemy.

In the actual ſtate of Greece, the reſpective ſucceſſes of the contending powers were not accompanied by proportional advantages. The Lacedæmonians derived not any permanent benefit from their victory at Coronæa, while their defeat at Cnidus deprived them in one day of the fruit of many laborious campaigns, ſince, with the aſſiſtance of a ſuperior naval force, and with the command of the Perſian treaſury, Conon found little difficulty in detaching for ever from their dominion the whole weſtern coaſt of Leſſer Aſia. The importance of the ſervices performed by Pharnabazus and Conon, excited the warmeſt gratitude in the breaſt of Artaxerxes. The merit of the ſatrap was acknowledged by his obtaining in marriage the daughter of the great king; while the patriotic Conon neither deſired nor received any perſonal reward. He inflamed the reſentment which both Pharnabazus and his maſter had conceived againſt Sparta, and encouraged them, early in the ſpring, to ſend their victorious armament towards Greece, to retaliate the ravages which had been committed in the eaſt by the arms of Ageſilaus. But he inſtructed them, that if they would render their vengeance complete, and humble the Spartan pride, they muſt enable him to rebuild the walls and harbours of Athens; a meaſure by which they would inflict the deepeſt wound on the power, as well as on the pride, of their ambitious enemy. The propoſal was heard with approbation; the expence was liberally ſupplied; the Perſian fleet ſet ſail, reduced the Cyclades and Cythera, ravaged the coaſt of Laconia, and, after performing in detached ſquadrons whatever ſeemed moſt uſeful for the Perſian ſervice, aſſembled in the long-deſerted harbours of the Phalerus, Munichia, and Piræus. There, the important taſk of reſtoring the ancient ornaments and defence of the city of Athens, was carried on and accompliſhed with extraordinary diligence. The work was completed before the return of ſpring; and the mortifying intelligence, when brought to Sparta, affected the magiſtrates of that republic with the deepeſt anxiety; an anxiety which induced them to ſtoop to the moſt humiliating terms, in order to obtain an accommodation with Artaxerxes.

Among the miniſters employed by Sparta to forward this negociation, was Antalcidas, a man whoſe prior hiſtory is little known; but who appears to have ſerved under the ſtandard of Cyrus in the Eaſt. Antalcidas was bold and ſubtle, a maſter in all the arts of diſſimulation, and well qualified to execute an inſidious commiſſion at a corrupt court. His ſucceſs was almoſt enſured by the imprudent management of Conon. After rebuilding the walls and harbours of Athens, he requeſted Pharnabazus that he might be allowed to employ a ſquadron of Perſian ſhips, in conjunction with his own, to infeſt the territories of Sparta and her allies. The ſatrap readily granted this demand. But Conon, unmindful of the common enemy, thought only of promoting the ambition of his republic. He ſailed to the Cyclades, to Chios, to Leſbos, and even to the coaſt of Eolis and Ionia, diſplayed the ſtrength of his fleet, deſcribed the flouriſhing ſtate of Athens, and endeavoured to compel the Aſiatics and iſlanders to acknowledge the authority of their ancient metropolis or ſovereign, who, having riſen more ſplendid from her ruins, required only the attachment of her former allies and ſubjects, to reſume her wonted power and hereditary renown.

This abſurd or ambitious conduct furniſhed powerful weapons to the dexterity of Antalcidas, who repreſented Conon as guilty of the moſt unexampled audacity, aggravated by the ſin of ingratitude, in attempting to alienate the king's dominions, even by the aſſiſtance of the king's forces, to which both his country and himſelf owed ſo many ſignal benefits. Availing himſelf of the favourable impreſſions which reſulted from this remark, Antalcidas declared that he had been commanded to offer ſuch terms of peace, as were more ſuitable to the dignity and the intereſt of the great king. "The Spartans, he ſaid, reſigned all pretenſions to the Greek cities in Aſia, which they acknowledged to be dependencies of the Perſian empire. Why ſhould Artaxerxes, then, continue to laviſh his treaſure in vain? ſince the Spartans not only ceded to him the immediate object of diſpute, but earneſtly deſired to promote the future proſperity of his dominions, by ſettling the affairs of Greece as beſt anſwered his convenience. For this purpoſe they were ready to declare all the cities and iſlands, ſmall and great, totally independent of each other; in conſequence of which there would not be any republic ſufficiently powerful thenceforth to diſturb the tranquillity of Perſia." Theſe terms were tranſmitted to the court of Suſa, that they might be approved and ratified by Artaxerxes. The ſubtlety and condeſcenſion of Antalcidas was rewarded by a conſiderable ſum of money; while the patriotiſm of Conon was puniſhed by immediate death or, by an ignominious confinement. His fate is variouſly related; but his actions juſtly rank him with the firſt of Grecian names; and the fame of an illuſtrious father was ſupported and rivalled by that of his ſon Timotheus.

It might have been expected that a plan of accommodation ſo advantageous for Perſia, would have been readily accepted by Artaxerxes. But the negociation languiſhed for ſeveral years, partly on account of the temporary diſgrace of Teribazus, who was ſucceeded by Struthas; a man who, moved by ſome unknown motive, warmly eſpouſed the intereſt of the Athenians; and partly by the powerful ſolicitations and remonſtrances of the Bœotian and Argive ambaſſadors, who accuſed the ſincerity, and unveiled the latent ambition, of Sparta. Meanwhile the war went on with unremitting activity. The Lacedæmonians and their allies ſallied from their ſtrong garriſons in Sicyon and the Lechæum, to deſtroy the harveſts and the villages of their Peloponneſian enemies. The Bœotians and Argives retaliated theſe injuries by ſeveral hoſtile incurſions into the territories of Sparta; while the Athenians, as if they had again attained the command of the ſea, built the whole vigour of their republic upon an element long propitious to their anceſtors.

The recent ſplendour of Conon had for a time eclipſed the renown of Thraſybulus, whoſe extraordinary abilities had twice reſcued his country from the yoke of tyrants. But after the death or captivity of the former, the Athenian fleet, amounting to forty ſail, was entruſted to Thraſybulus; who, having ſcoured the Ægean ſea, ſailed to the Helleſpont, and compelled the inhabitants of Byzantium, and ſeveral other Thracian cities, to aboliſh their ariſtocratic government, and accept the alliance of Athens. His activity was next directed againſt the iſle of Leſbos, in which the Lacedæmonian intereſt was ſtill ſupported by a conſiderable body of troops. Having landed his men, he joined battle with the enemy in the neighbourhood of Methymna, and obtained a complete victory, after killing with his own hand Therimachus, the Spartan general. The principal cities of the iſland now acknowledged the Athenian power, and exerted every nerve to reinforce their fleet. Encouraged by this ſucceſs, Thraſybulus ſailed towards Rhodes, in order to aſſiſt the democratic faction, which uniformly contended for the intereſt of Athens. But before proceeding to that iſland, he determined to multiply the reſources of the fleet. For this purpoſe he raiſed conſiderable ſupplies from the maritime towns of Aſia, and at length entered the mouth of the Eurymedon, and levied a heavy contribution on Aſpendus, the capital of Pamphylia. But here his good fortune failed him. The patient timidity of the barbarians had for a

ong time endured the public depredation; but even their ſervility could not brook the private rapacity of the ſailors and troops. They attacked the Grecian camp in the night, and ſurpriſed the tent of Thraſybulus, who thus fell a ſacrifice to a very unjuſtifiable paſſion, which greatly debaſed the dignity of his otherwiſe illuſtrious character. This unjuſt treatment of Aſpendus would never perhaps have reached the ears of Artaxerxes, had it not been communicated through the vigilance of Antalcidas, who let ſlip no opportunity to rouſe the jealouſy of the great king againſt the Athenians. The ſevere exactions from Pamphylia, a province which acknowledged his authority, afforded a powerful argument with the Perſian monarch to concur with the wiſhes of the Spartans, at the very moment when his fluctuating irreſolution was completely decided by the Athenians themſelves, whoſe imprudence at once crowned the triumph of Antalcidas.

The ſignal victories of Conon and Thraſybulus, and the riſing fortune of Athens, encouraged Evagoras king of Salamis to execute his long-meditated deſign of revolting from Perſia. Egypt was actually in rebellion; Artaxerxes had undertaken a war againſt the Carduchians, who were by no means a contemptible enemy. Theſe were favourable circumſtances to Evagoras; although the Perſian fleet, which, after performing the ſervice for which it had been equipped, had continued to lie inactive in the Phœnician and Silician harbours, was ready to be employed in any new enterpriſe. The ſkilful and experienced bravery of the king of Salamis, ſeconded by the youthful ardour of his ſon Protagoras, obtained an eaſy victory over the firſt ſquadrons that were ſent to invade his iſland. But there was reaſon to dread the arrival of a far ſuperior force. In this danger, Evagoras requeſted, and obtained, the aſſiſtance of the Athenians. This extraordinary meaſure of a people, in preferring their gratitude to their intereſt; a gratitude which they might have foreſeen to be uſeleſs to him they meant to oblige, and pernicious to the moſt important intereſts of their republic; finally determined Artaxerxes to eſpouſe the cauſe of the Spartans; and to dictate the terms of a general peace, as propoſed by Antalcidas: "That the Greek cities in Aſia, with the iſland of Cyprus, and the peninſula of Clazomenè, ſhould be ſubject to Perſia; Athens ſhould be allowed to retain her immemorial juriſdiction in the iſles of Lemnos, Imbros, and Scyros; but all the other republics, ſmall and great, ſhould enjoy the independent government of their own hereditary laws. Whatever people rejected theſe conditions, ſo evidently calculated for preſerving the public tranquillity, muſt expect the utmoſt indignation of the great king, who, in conjunction with the republic of Sparta, would make war on their perverſe and dangerous obſtinacy, by ſea and land." Teribazus and Antalcidas returned from the eaſt, charged with theſe definitive reſolutions of Artaxerxes, which were confirmed by the unalterable ſanction of the royal ſignet, in the year before Chriſt 387.

There was reaſon to apprehend that Thebes, Athens, and Argos, would reject the terms of a peace ſo pernicious to their particular and immediate intereſts, and equally diſhonourable to the whole Grecian name. The remembrance of the glorious confederacy for defending the Aſiatic colonies againſt the oppreſſion of barbarians, could not, indeed, much influence the degenerate councils of thoſe republics; but the Thebans muſt reſign, with reluctance, their real or pretended authority over the cities of Bœotia; the Argives muſt unwillingly withdraw their garriſon from Corinth, and leave that important capital in the power of the Lacedæmonian faction; and the Athenians muſt abandon, with regret, the fruits of their recent victories, and the hopes of recovering their ancient grandeur. The oppoſition of theſe ſtates had been foreſeen by Antalcidas, who took the moſt effectual meaſures to render it impotent. By the aſſiſtance of Perſian money he equipped a fleet of eighty ſail, from the mercenary ſea-ports of Greece and Aſia, from the intermediate iſles, and even from the coaſts of Italy and Sicily. This armament was independent of the ſquadrons with which Teribazus prepared to attack the iſle of Cyprus, if the preſumption of Evagoras, unaſſiſted and alone, ſhould ſtill dare to provoke his hoſtility. The ſatrap alſo had collected a very conſiderable army, which was ready to co-operate with Ageſilaus, and to march, at the firſt ſummons, againſt any city or republic that might reject the peace of Antalcidas. Theſe vigorous preparations, intimidating the weakneſs of the confederates, compelled them into a reluctant compliance with the terms of the treaty. The Thebans made the ſtrongeſt and moſt obſtinate reſiſtance; but their pretenſions were finally ſilenced by the threats of the Spartan king, the inveterate enemy of their republic. The Bœotian cities were acknowledged to be independent, and admitted as parties in the peace. The Argives retired from Corinth, which, being deſerted by the leaders of the democratical faction, became the ally of Sparta. The military and naval operations ceaſed, tranquillity was reſtored, and the armies and fleets were, on both ſides, diſbanded and diſſolved.

But amidſt this univerſal ſubmiſſion to the court of Perſia, the article reſpecting Cyprus was nobly rejected by Evagoras, who aſſerted the independence of his native iſland; and, with a magnanimity that formed a ſtriking contraſt with the degenerate ſoftneſs of his Grecian allies, ſet the power of Artaxerxes at defiance. Evagoras truſted to the reſources of his own vigorous mind, to the ſuperior ſkill of his ſeamen, and to the aſſiſtance of Acoris king of Egypt. But the numerous ſquadrons of Teribazus prevailed over all his hopes. He was diſcomfited in a naval engagement; his territories were invaded and ravaged; he was driven into his capital, Salamis; and even Salamis was threatened with a ſiege. His reſiſtance had already exceeded what his ſtrength warranted, or what his dignity required; yet his enemies were unwilling to drive him to deſpair. He reſigned his numerous and recent conqueſts in Cyprus, but retained poſſeſſion of the ancient principality of Teucer, which his fortunate arms had recovered from an uſurper; and he ſubmitted, in the year before Chriſt 385, to imitate the example of other princes, and acknowledge himſelf the tributary of the king of Perſia.

Nearly all writers, both ancient and modern, have concurred in deſcribing the peace of Antalcidas as highly diſgraceful and injurious to the intereſts of Lacedæmon. Mr. Mitford, however, in his recent Hiſtory of Greece, has controverted this opinion. He ſays, "that king Ageſilaus highly approved the treaty of Antalcidas; and it would be difficult for thoſe who have declaimed moſt vehemently againſt it, to ſhew how peace could have been given to Greece in any other manner. The abandoning of the Aſian Greeks to ſubjection under Perſia, is indeed a ſpecious ground of reproach, ſince it was unqueſtionably a ſurrender of the proudeſt and faireſt claim of glory that Lacedæmon perhaps ever acquired. But this ſeems not juſtly imputed as a peculiar crime or diſhonour to Antalcidas; for, by conſidering the intereſt of Lacedæmon as diſtinct from the common intereſt of Greece, Antalcidas certainly ſerved his country very ably. Simple and conciſe as the terms of the peace are, not only they appear directly calculated to promote the intereſt of Lacedæmon, but they anſwered all the principal purpoſes of the Lacedæmonians completely. To break the growing power of Thebes by emancipating the Bœotian towns, and to divide Corinth from Argos, had been the great object of the war, and were the immediate effects of the peace; for the more ready and quiet production of which Athens was bribed with the permiſſion, contrary to the general ſpirit of the treaty, to retain the dominion

dominion of its three iſlands. Accordingly it is obſerved by Xenophon, that the Lacedæmonians eſtabliſhed their credit and influence in Greece much more completely, and put their commonwealth altogether in a much more ſplendid ſituation, by the peace which had its name from Antalcidas, than by that which had concluded the Peloponneſian war; ſo much alſo was Ageſilaus perſuaded that the intereſt of Lacedæmon was well conſidered in the treaty, that when an orator, reviling the peace of Antalcidas, ſaid, that Lacedæmon was gone over to the Perſian intereſt, 'Rather, he anſwered, Perſia to the Lacedæmonian;' and ſo in truth it ſeems to have been."

From the PEACE of ANTALCIDAS, to the TERMINATION of the THIRD SOCIAL WAR.

The peace of Antalcidas forms an important epoch in the Grecian hiſtory. The valuable colonies in Aſia, the cauſe, the object, and the ſcene, of ſo many memorable wars, were now to be abandoned to the power of a barbarian maſter. The king of Perſia diſmembered the diſtant dependencies, and controuled the domeſtic arrangements, of a people who had given the law to his anceſtors. Their ancient confederacies were diſſolved; and Greece felt the languor of peace without enjoying the benefits of ſecurity. But if the whole Grecian name was diſhonoured by accepting this ignominious treaty, what peculiar infamy muſt attach to the magiſtrates of Sparta, by whom it was propoſed and promoted? That intereſt and ambition, and not a generous deſire to promote the public tranquillity, had produced this perfidious treaty, could not long be kept a ſecret. Thebes and Argos were required to comply with the terms of the peace; but no mention was made of withdrawing the Lacedæmonian garriſons from the ſtrong holds which they occupied; and leſt this injuſtice might occaſion general diſcontent, the Athenians were allowed the ſame privilege. Meanwhile the Spartan emiſſaries negociated and intrigued in all the ſubordinate cities, encouraging the ariſtocratical factions, and fomenting the animoſities of the citizens againſt each other, and againſt their reſpective capitals. The jealouſies and complaints, which had been principally occaſioned by theſe cabals, were uſually referred to the Spartan ſenate; whoſe affected moderation, under pretence of defending the cauſe of the weak and the injured, always decided the conteſt in the way moſt favourable for themſelves. But the warlike diſciples of Lycurgus could not remain ſatisfied with theſe juridical uſurpations. They determined to take arms, which they hoped to employ with ſuch artful dexterity as might prevent any dangerous alarm, beginning with ſuch cities as had not entered into the late confederacy againſt them, gradually extending their hoſtilities to the more powerful members of that confederacy; and thus conquering ſucceſſively thoſe, whoſe entire and collective ſtrength it would have been vain to aſſail.

The firſt victim of this ambitious policy was the flouriſhing republic of Mantinæa, whoſe territory was ſituate almoſt in the centre of Arcadia, in the Peloponneſus. The origin of Mantinæa was the ſame with that of Tegea, Stymphalis, Heræa, Orchomenos, and other neighbouring cities, which had grown into populouſneſs and power from the ſcattered villages of ſhepherds inhabiting the valleys and mountains of Arcadia. The exuberant fertility and picturesque ſcenery of this delightful region ſeemed peculiarly adapted to inſpire and to gratify the love of rural happineſs; and to afford, in all their elegance and dignity, thoſe ſublime and ſacred joys of the country, which the genius of the ancient poets felt and deſcribed with ſo much ſenſibility. It was only in the year immediately following the treaty of Antalcidas, that Lacedæmonian ambaſſadors were ſent to Mantinæa, to expreſs the reſentment of their republic againſt a people, who, pretending to live in friendſhip with them, had in the late war repeatedly furniſhed with corn their avowed enemies the Argives. They added, that, on other occaſions, the Mantinæans had diſcovered a ſecret hatred to Sparta, rejoicing in her misfortunes, and envying her proſperity; and that it was time to anticipate this dangerous animoſity; for which purpoſe the Spartans commanded them to demoliſh their walls, to abandon their city, and return to thoſe peaceful villages in which their anceſtors had lived and flouriſhed. The Mantinæans received this propoſal with the indignation it merited; the ambaſſadors retired in diſguſt; the Spartans declared war; ſummoned the aſſiſtance of their confederates; and a powerful army, commanded by king Ageſipolis, invaded Arcadia, in the year before Chriſt 386.

But the moſt deſtructive ravages could not bend the ſtubborn heroiſm of the Mantinæans. The ſtrength and loftineſs of their walls ſeemed to bid defiance to aſſault; yet Ageſipolis prepared for a vigorous ſiege; and this tedious ſervice exhauſted the patience of the beſiegers, without ſhaking the firmneſs of the beſieged. The Spartans were afraid to detain longer in the field their reluctant confederates; but Ageſipolis propoſed a new meaſure, which was attended with ſucceſs. The river Ophis, formed by the collected torrents from mount Anchiſius, a river broad and rapid, which flowed through the plain, was, notwithſtanding the laborious undertaking, turned againſt the walls of Mantinæa, whereby they were ſapped to the foundation, and began to totter. The activity of the inhabitants propped them with wood, but without any permanent advantage; ſo that, deſpairing of being able to elude the enemy, they ſent to capitulate, requeſting that they might be permitted to keep poſſeſſion of their city, on condition that they demoliſhed their fortifications, and followed, in peace and war, the fortune of Sparta. But Ageſipolis refuſed to grant them any other terms than thoſe which had been originally propoſed by the republic. He inſiſted, therefore, that the Mantinæans ſhould deſtroy their houſes in the city; ſeparate into four diſtinct communities; and return to thoſe villages which their anceſtors had inhabited; and they were forced into a compliance with this humiliating demand.

Meanwhile ambaſſadors arrived from Acanthus and Apollonia, two cities of the Chalcidice, requeſting the Lacedæmonian aſſiſtance againſt the ambitious and overbearing citizens of Olynthus. Cleigenes, the Acanthian, ſpoke in the name of his colleagues: "We apprehend, O Lacedæmonians and allies! that amidſt the multiplied objects of your care and correction, you have overlooked a great and growing diſorder which threatens, like a peſtilence, to infect and pervade Greece. The ambition of the Olynthians has increaſed with their power. By the voluntary ſubmiſſion of the ſmaller cities in their neighbourhood, they have been enabled to ſubdue the more powerful. Emboldened by this acceſſion of ſtrength, they have wreſted from the king of Macedon his moſt valuable provinces. They actually poſſeſs Pella, the greateſt city in that kingdom; and the unfortunate Amyntas is on the point of abandoning the remainder of his dominions, which he is unable to defend. The preſent emergency, therefore, calls aloud for the activity and valour of your republic. By yielding a ſeaſonable aſſiſtance to Acanthus and Apollonia, you will ſave from oppreſſion two peaceful communities, and check the ambition of an uſurping tyrant." The Lacedæmonians, with an affected impartiality, deſired the opinion of their allies, before declaring their own. The confederates with one conſent, but eſpecially thoſe who wiſhed to ingratiate themſelves with Sparta, determined to undertake the expedition againſt Olynthus. The Spartans commended the facility of their reſolution, and it was reſolved immediately to furniſh ten thouſand effective men; and a liſt was prepared, containing the reſpective contingents to be ſupplied by the

ſeveral cities, which ſhould be ready to take the field within a limited time.

The ambaſſadors then roſe up, and Cleigenes, again ſpeaking for the reſt, declared that theſe were indeed noble and generous reſolutions; but, unfortunately, could not be executed with ſuch promptitude as ſuited the urgency of the preſent criſis. The dangerous ſituation of Acanthus and Apollonia demanded inſtant aid. He propoſed, therefore, that thoſe troops which were ready ſhould immediately take the field. The Lacedæmonians acknowledged the expediency of the advice; and commanded Eudamidas, with two thouſand men, to proceed without delay to Macedon, while his brother Phœbidas collected a powerful reinforcement, in order to follow him. But theſe auxiliaries were retarded until the ſeaſon for action had been nearly ſpent. Yet Eudamidas, with his little band, performed very eſſential ſervice. He ſtrengthened the garriſons of ſuch places as were moſt expoſed to aſſaults from the enemy; the appearance of a Spartan army encouraged the ſpirit of revolt among the allies and ſubjects of Olynthus; and ſoon after his march into the Chalcidice, Eudamidas received the voluntary ſurrender of Potidæa, a city of great importance in the iſthmus of Pallene. Such was the firſt campaign of a war which laſted four years, and was carried on under four ſucceſſive generals. Eudamidas, too much elated by his firſt ſucceſs, ravaged the Olynthian territory, and unguardedly approached the city; when he was intercepted, conquered, and ſlain, and his army diſperſed or loſt.

Teleutias, the brother of Ageſilaus, next aſſumed the conduct of this diſtant expedition with a body of ten thouſand men. He was aſſiſted by Amyntas king of Macedon, and ſtill more effectually by Derdas, the brother of that prince, and the governor of Elymea, the moſt weſtern province of Macedon, which abounded in cavalry. By the united efforts of theſe generals, the Olynthians, who had been defeated in various rencounters, were ſhut up within their walls, and prevented from cultivating their territory. Teleutias at length marched with his whole forces to aſſault the place. His ſurpriſe and indignation were excited by the boldneſs of the Olynthian horſe, who ventured to paſs the river Amnias in ſight of ſuch a ſuperior army; and he ordered the targeteers, who were commanded by Tlemonidas, to repel their inſolence. The cavalry made an artful retreat acroſs the Amnias, and were fiercely purſued by the Lacedæmonians. When a conſiderable part of the latter had likewiſe paſſed the river, the Olynthians ſuddenly faced about and charged them. Tlemonidas, with above an hundred of his companions, fell in the action. The Spartan general beheld with rage the ſucceſsful bravery of the enemy. Graſping his ſhield and lance, he commanded the cavalry, and the remainder of the targeteers, to purſue without intermiſſion; and, at the head of his heavy-armed men, advanced with leſs order than celerity. The Olynthians attempted not to ſtop their progreſs, till they arrived under the battlements. At that moment the townſmen mounted their ramparts, and aſſailed the enemy with a ſhower of darts and arrows, and every kind of miſſile weapon. The flower of the Olynthian troops, who had been purpoſely drawn up behind the gates, then ſallied forth with irreſiſtible violence; Teleutias, attempting to rally his men, was ſlain in the firſt onſet; the Spartans who attended him gave ground; the whole army was defeated, and purſued with great ſlaughter towards Acanthus, Apollonia, Spartolus, and Potidæa.

This diſaſter, however, did not cool the ardour of the Spartans. In the year 381 before Chriſt, which was the third of the war, they ſent Ageſipolis, with a powerful reinforcement, into Macedonia. The arrival of this prince early in the ſpring, revived the hopes of the vanquiſhed, and confirmed the attachment of the Lacedæmonian allies. He invaded and ravaged ſuch parts of the Olynthian territory as had been ſpared in former incurſions, and took by ſtorm the ſtrong city of Torona. But in the midſt of theſe ſucceſſes he was ſeized with a violent illneſs, and died on the ſeventh day of the diſeaſe. His brother Cleombrotus ſucceeded to the Spartan throne; and Polybiades, a general of experience and capacity, was inveſted with the command in Macedon.

Polybiades, after the example of his predeceſſors, conducted a powerful reinforcement againſt Olynthus, which was completely ſurrounded by land, while a ſquadron of Lacedæmonian gallies blocked up the neighbouring harbour of Mecyberna. The events of the ſiege were ſuch, that the Olynthians were exceedingly diſtreſſed by famine before their obſtinacy could permit them to capitulate. They formally relinquiſhed all claim to the dominion of the Chalcidice; they ceded the Macedonian cities to their ancient ſovereign; and engaged, by ſolemn oaths, to obey, in peace and war, their Spartan confederates and maſters. In conſequence of this humiliating treaty, Polybiades led off his victorious army, and Amyntas re-eſtabliſhed his court at Pella, which became thenceforth the capital of Macedon.

Such was the concluſion of the Olynthian war, which breathed the ſame ſpirit with the peace of Antalcidas, and proved the degenerate ambition of the Spartans to be wholly actuated by the view of extending their own dominion in Greece. This ſelfiſh policy merited the indignation of the whole Grecian name, who were at length excited againſt Sparta by a very unlooked-for event. When Eudamidas undertook the expedition againſt Olynthus, it was intended that his brother Phœbidas ſhould follow him at the head of eight thouſand men. This powerful reinforcement marched from Peloponneſus, and, in their journey northwards, encamped in the neighbourhood of Thebes, which was then divided by the inveterate hoſtility of contending factions. Iſmenias headed the democratical party; Leontiades ſupported the intereſt of Sparta and of ariſtocracy. It is not certain that Phœbidas had any orders to interfere in this diſſenſion, when he was accoſted by Leontiades, "who exhorted him to ſeize the opportunity, which fortune had thrown in his way, of performing a ſignal ſervice to his country." He then explained to the Lacedæmonian the diſtracted ſtate of Thebes, and the facility with which he might become maſter of the citadel; ſo that, while his brother Eudamidas was carrying on the war againſt Olynthus, he himſelf would acquire poſſeſſion of a much greater city. The mode of executing their plan was ſoon ſettled. To elude ſuſpicion, Phœbidas made the uſual preparations for continuing his journey, when he was ſuddenly recalled by his aſſociate. It was the month of July, when the Theban matrons celebrated the feſtival of Ceres, and prayed that bountiful divinity to preſerve the hope of a favourable harveſt. The appropriated ſcene of their female worſhip was the Cadmæa, or citadel, of which the gates had been purpoſely thrown open, and which was totally defenceleſs, as the males were univerſally excluded from this ceremony. Every circumſtance conſpired to facilitate the deſign of Leontiades, who conducted the Lacedæmonians to the fortreſs, without finding the ſmalleſt oppoſition. He immediately deſcended to the ſenate, which was then ſitting in the market-place; declared that the Lacedæmonians had acted by his advice, and without any purpoſe of hoſtility; ſeized Iſmenias as a diſturber of the public peace, and ordered the other leaders of the republican faction to be taken into cuſtody. Many were caught and impriſoned, and about four hundred eſcaped to Athens.

During five years the Spartans maintained, in the Cadmæa, a garriſon of fifteen hundred men; during which time moſt of the citizens ſuffered ſimilar calamities to thoſe which afflicted Athens under the thirty tyrants. The ſeverity of the government at length drove the Thebans to deſpair; and both the perſecuted exiles abroad, and the oppreſſed ſubjects at home, prepared to embrace

embrace any meaſures which promiſed them a faint hope of relief. Among the Theban fugitives who had taken refuge in Athens, was Pelopidas, the ſon of Hippocles, a youth whoſe diſtinguiſhed generoſity and courage had marked him out as gifted by Providence for the defender of his country. He had often conferred with his fellow-ſufferers at Athens about the means of returning to Thebes, and reſtoring the democracy; and while they ſecretly deliberated on this important object, Mello, one of the exiles, introduced Phyllidas, whoſe enterpriſing activity and ſingular boldneſs qualified him for the moſt arduous undertaking.

In Athens, the time and the means were adjuſted for executing the conſpiracy. A body of Theban exiles aſſembled in the Thriaſian plain, on the frontier of Attica, where twelve of the moſt enterpriſing voluntarily offered to enter the capital, and to co-operate with Phyllidas, ſecretary to the council, in the deſtruction of the magiſtrates. The diſtance between Thebes and Athens was about thirty-five miles. The conſpirators had thirteen miles to march through a hoſtile territory. They diſguiſed themſelves in the garb of peaſants, arrived at the city towards evening, and paſſed the gates without ſuſpicion. During that night, and the ſucceeding day, the houſe of Charon, a wealthy and reſpectable citizen, the friend of Phyllidas, and a determined enemy of the ariſtocracy, afforded them a ſecure refuge, till the fatal moment of action arrived. The important evening approached, when the artful ſecretary had prepared a ſumptuous entertainment in the treaſury. Here the inſidious and ill-fated Archias, with the Spartan magiſtrates, revelling in debauch, were ſoon overcome with wine and folly. At a given ſignal the conſpirators drew their daggers, and effected their purpoſe. Charon and Mello were the principal actors in this bloody ſcene, which was entirely directed by Phyllidas. But a more difficult taſk remained. Leontiades, with other abettors of the tyranny, ſtill lived, to avenge the murder of their aſſociates. The conſpirators, encouraged by their firſt ſucceſs, and conducted by Phyllidas, gained admiſſion into their houſes ſucceſſively, by means of the unſuſpected ſecretary. On the appearance of diſorder and tumult, Leontiades ſeized his ſword, and boldly prepared for his defence; but Pelopidas inſtantly aſſailed and killed the principal author of the Theban ſlavery. His aſſociates periſhed without reſiſtance; men whoſe names may be conſigned to juſt oblivion, ſince they were diſtinguiſhed by nothing memorable but their cruel and oppreſſive tyranny.

The meaſures of the conſpirators were equally vigorous and prudent. Before alarming the city, they proceeded to the different priſons, which were crowded with the unfortunate victims of arbitrary power. Every door was open to Phyllidas. The captives, tranſported with joy and gratitude, increaſed the ſtrength of their deliverers. They broke open the arſenals, and provided themſelves with arms. The ſtreets of Thebes now reſounded with alarm and terror. During a moment of awful ſilence, a herald proclaimed, with a clear and loud voice, the death of the tyrants, and ſummoned to arms the friends of liberty and the republic. Among others who obeyed the welcome invitation was Epaminondas, the ſon of Polymnis, a youth of the moſt illuſtrious merit; who united the wiſdom of the ſage, and the magnanimity of the hero, with the practice of every mild and gentle virtue; in birth, valour, and patriotiſm, not inferior to Pelopidas, with whom he had contracted an early friendſhip. Encompaſſed by an invincible band, Pelopidas and his aſſociates proceeded to the market-place; ſummoned a general aſſembly of the people; explained the neceſſity, the object, and the extent, of the conſpiracy; and, with the univerſal approbation of their fellow-citizens, reſtored the democratic form of government.

Exploits of valour and intrepidity may be diſcovered in the hiſtory of every nation. But the revolution of Thebes diſplayed not leſs wiſdom of deſign, than gallantry in execution. Amidſt the tumult of action, and ardour of victory, the conſpirators poſſeſſed ſufficient coolneſs and foreſight to reflect that the Cadmæa, or citadel, which was held by a Lacedæmonian garriſon of fifteen hundred men, would be reinforced, on the firſt intelligence, by the activity of Sparta. To anticipate this event, they diſpatched a meſſenger to Athens, to communicate the news of a revolution which could not fail to be highly agreeable to that ſtate, and to ſolicit the immediate aſſiſtance of the Athenians. This meſſage was attended with the moſt ſalutary effects. The diſcernment of the Athenians eagerly ſeized the favourable opportunity of weakening Sparta, which, if once neglected, might never return. Several thouſand men were ordered to march, who reached Thebes the day after Pelopidas had re-eſtabliſhed the democracy. The events of the ſiege are variouſly related. According to the moſt probable account, the garriſon made but a feeble reſiſtance, being intimidated by the impetuous alacrity and increaſing numbers of the aſſailants, who already amounted to fourteen thouſand men, and received continual acceſſions of ſtrength from the neighbouring cities of Bœotia. In a few days the Lacedæmonians deſired to capitulate, on condition of being allowed to depart in ſafety with their arms. Their propoſal was readily accepted; but they made no terms for thoſe unfortunate Thebans, whoſe attachment to the Spartan intereſt ſtrongly ſolicited their protection. The greater part of them periſhed by the cruel reſentment of their countrymen; and only a remnant remained, which was ſaved by the humane interpoſition of the Athenians.

The emancipation of Thebes gave a deep wound to the tyranny of Sparta; and occaſioned the Bœotian war, which commencing in the year before Chriſt 378, laſted with little interruption during ſeven years, and ended with the battle of Leuctra, which produced a total revolution in the affairs of Greece. In the heart of a ſevere winter, Cleombrotus, with a well-appointed army, commenced the war by entering Bœotia. His preſence confirmed the obedience of Theſpiæ, Platæa, and other inferior communities. He defeated ſome ſtraggling parties of the Thebans, repelled their incurſions, ravaged their territory, burned their villages, but attempted not to make any impreſſion on the ſtrength of their city. After a campaign of two months, he returned home, leaving a numerous garriſon in Theſpiæ, commanded by Sphodrias, a general of great enterpriſe, but little prudence.

Meanwhile the Athenians, alarmed by a nearer view of danger, diſavowed the aſſiſtance which they had given to Thebes; and baniſhed, or put to death, the adviſers of that meaſure, in order to renew their alliance with Sparta. The Thebans felt the full importance of this defection, and left nothing untried to prevent its fatal tendency; a deſign in which they ſucceeded by a very ſingular ſtratagem. The light and raſh character of Sphodrias was well known to the Theban chiefs, who employed ſecret emiſſaries to perſuade him, by arguments moſt flattering to his paſſions, to attack by ſurpriſe the harbour of Athens. The diſtance between Thebes and Theſpiæ, which was not more than twenty miles, furniſhed an eaſy opportunity for carrying on theſe ſecret practices; but the diſtance, which exceeded forty miles, between Thebes and Athens, rendered the enterpriſe of Sphodrias abortive. He marched from Theſpiæ with the flower of his army, early in the morning, expecting to reach the Piræus before the dawn of the ſucceeding day. But the report flew to Athens, and the citizens, with their uſual alacrity, ſeized their arms, and prepared for a vigorous defence. The mad deſign, and the ſtill greater madneſs of Sphodrias, in ravaging the country on his retreat, provoked the fury of the Athenians. They immediately ſeized the perſons of ſuch

ſuch Lacedæmonians as reſided in their city. They ſent an embaſſy to Sparta, complaining, in the moſt indignant terms, of the inſult of Sphodrias. The Spartans diſavowed his conduct. He was recalled and tried, but ſaved from death by the authority of Ageſilaus.

The next year, B. C. 376, Ageſilaus repeatedly invaded Bœotia, without performing any thing worthy of his former renown. His army amounted to eighteen thouſand foot, and fifteen hundred horſe. The enemy were aſſiſted by a conſiderable body of mercenaries, commanded by Chabrias the Athenian, who finally repelled the Spartan king from Thebes. He returned home to be cured of his wounds; where he ſuffered the mortifying reproaches of his adverſary Antalcidas, "for teaching the Thebans to conquer." But the generals who ſucceeded them had no better ſucceſs. Phœbidas, the original author of the war, who had been appointed governor of Theſpiæ, was defeated and ſlain, with the greateſt part of the garriſon of that place. Pelopidas, with his own hand, killed the Spartan commander in the action at Tanagra; and in the pitched battle of Tegyra, the Lacedæmonians, though ſuperior in number, were broken and put to flight.

While the war was thus carried on by land, the Athenians put to ſea, and gained the moſt diſtinguiſhed advantages on their favourite element. The Lacedæmonian fleet, of ſixty ſail, commanded by Pollis, was totally defeated near the iſle of Naxos, by the bravery of Chabrias, who performed alternately the duties of admiral and general. But the principal ſcene of action was the Ionian ſea, where Timotheus and Iphicrates every where prevailed over thoſe who oppoſed them. The fleet of Sparta was almoſt annihilated by the victors, who repeatedly ravaged the coaſts of Laconia, and laid under heavy contributions the iſlands of Corcyra, Zacinthus, Leucadia, and Cephalenia. Even the iſland of Chios, and the city of Byzantium, deſerted their connection with the declining fortune of Sparta, and once more accepted the alliance of the Athenians. Theſe hoſtile operations, which weakened, without ſubduing the ſpirit of, the vanquiſhed, were interrupted by the ſolicitations of the king of Perſia, who wiſhed to promote the domeſtic tranquillity of Greece, that he might enjoy the aſſiſtance of its arms in cruſhing a new rebellion in Egypt. His emiſſaries met with equal ſucceſs in Athens and Sparta, which were alike weary of the war, the former having little more to hope, and the latter having every thing to fear, from its continuance. Many of the inferior ſtates, being implicitly governed by the reſolves of theſe powerful republics, readily imitated their example. And ſo precarious and unſettled was the condition of them all, that above twenty thouſand men abandoned their homes and families, and followed the ſtandard of the Perſians. The merit of Iphicrates juſtly entitled him to the command of his countrymen, which was unanimouſly conferred on him. But the expedition produced nothing worthy of ſuch a general, who in a few months returned to Athens, diſguſted with the pride and timidity of the Perſian commanders. Meanwhile the Thebans, who had diſregarded the invitation of Artaxerxes, profited of the diverſion made by the Egyptian war, to reduce ſeveral cities of Bœotia. The walls of Theſpiæ were raſed to the ground; Platæa met with the ſame fate; and its inhabitants, after ſuffering the cruelleſt indignities, were driven to ſolicit the protection of the Athenian aſſembly, who kindly received them into the boſom of their republic, and expreſſed the utmoſt indignation againſt their inſolent oppreſſors.

This affecting tranſaction threatened to deprive the Thebans of an ally to whom they were in a great meaſure indebted for their proſperity. Their ſubſequent conduct tended ſtill farther to widen the breach. They marched troops into Phocis, with an intention to reduce that country. They heard with equal diſdain, the remonſtrances of their friends, and the threats of their enemies. Their lofty ſpirit totally alienated the Athenians, who ſeemed diſpoſed to conclude a laſting peace with Sparta, on the principles of the treaty of Antalcidas, that their reſpective garriſons ſhould be withdrawn from foreign parts, and the communities, ſmall as well as great, be permitted to enjoy the independent government of their own laws. The intereſt of the king of Perſia, who ſtill needed the aſſiſtance of Greece to carry on the Egyptian war, induced him to employ his good offices for promoting this ſpecious purpoſe; and a convention of all the ſtates was ſummoned to Sparta, whither the Thebans deigned indeed to ſend a repreſentative; but one whoſe firmneſs and magnanimity were well fitted to ſuſtain and elevate the aſpiring pretenſions of his republic. This repreſentative was Epaminondas, to whoſe abilities and eloquence the Thebans committed the defence of their moſt important intereſts in the general congreſs of the Grecian ſtates. The Athenians ſent Antocles and Calliſtratus. Ageſilaus himſelf appeared on the part of Sparta. Matters were eaſily adjuſted between thoſe leading republics, who felt equal reſentment at the fate of Theſpiæ and Platæa. They lamented their mutual jealouſy, and unfortunate ambition, which had occaſioned ſo many bloody and deſtructive wars; and commemorated the ſhort but glorious intervals of moderation and concord, which had tended ſo evidently to their own and the public felicity. Inſtructed by fatal experience, it was time for them to lay down their arms, and to allow that tranquillity to themſelves and to their neighbours, which was neceſſary to heal the wounds of their common country. The peace could not be uſeful or permanent, unleſs it were eſtabliſhed on the principles of equality and freedom, to which all the Grecian communities were alike entitled by the treaty of Antalcidas. It was propoſed, therefore, to renew that ſalutary contract, which was accepted by the unanimous conſent of Athens, of Sparta, and of their reſpective confederates.

Epaminondas then ſtood up, offering to ſign the treaty in the name of the Bœotians. "The Athenians," he took notice, "had ſigned for all the inhabitants of Attica; the Spartans had ſigned not only for the cities of Laconia, but for their numerous allies in all the provinces of the Peloponneſus. Thebes was entitled to the ſame prerogatives over her dependent cities, which had anciently acknowledged the power of her kings, and had recently ſubmitted to the arms of her citizens." Ageſilaus, inſtead of anſwering directly a demand which could neither be granted with honour, nor denied with juſtice, aſked in his turn, Whether it was the intention of the Thebans to admit, in terms of the treaty, the independence of Bœotia?—Epaminondas demanded, Whether it was the intention of Sparta to admit the independence of Laconia? "Shall the Bœotians," ſaid the king, with emotion, "be free?"—"Whenever," replied Epaminondas, with firmneſs, "you reſtore freedom to the Lacedæmonians, the Meſſenians, and the oppreſſed communities of Peloponneſus, whom, under the name of allies, you retain in an involuntary and rigorous ſervitude." Theſe juſt remonſtrances of Epaminondas made a deep impreſſion on the deputies. Ageſilaus, alarmed at its effect, anſwered him in a ſtrain very different from that deſpotic brevity which the Spartans uſually affected. His ſpeech was long and eloquent. The deputies were awed into ſubmiſſion, leſs perhaps by the force of his eloquence, than by the terror of the Spartan armies ready to take the field. But the words of Epaminondas ſunk deep into their hearts. They communicated, at their return, the powerful impreſſion to their conſtituents; and its influence was viſible in the field of Leuctra, and in the events which followed that memorable engagement.

In the interval of ſeveral months, between the congreſs at Sparta and the invaſion of Bœotia, Ageſilaus and his ſon Archidamus collected the domeſtic ſtrength

of their republic, and ſummoned the tardy aid of their confederates. Sickneſs prevented the Spartan king from taking the field in perſon; but his advice prevailed with the ephori and ſenate, to command his colleague Cleombrotus to march without delay againſt the Thebans, with aſſurances of being ſpeedily joined by a powerful reinforcement. The rendezvous was appointed in the plain of Leuctra, ſituate on the Bœotian frontier, almoſt at the equal diſtance of ten miles from the ſea and from Platæa. The Spartans and their confederates joined forces in this neighbourhood; and their army amounted to twenty-four thouſand foot, and ſixteen hundred horſe. The Theban infantry did not amount to more than half that number. Their cavalry, however, nearly equalled thoſe of the Spartans, and far excelled them in diſcipline and in valour. Epaminondas exhorted them to march, and repel the invaders, if they would prevent the defection of Bœotia, and avoid the dangers and diſgrace of a ſiege. They readily obeyed, and proceeded to the neighbouring mountains, on which having encamped, they obtained a commanding view of their enemy's forces in the plain. Before conducting them to battle, Epaminondas diſplayed his invincible courage and confidence of victory, by permitting all thoſe to retire, who either diſapproved his cauſe, or were averſe to ſhare his danger; a permiſſion which the Theſpians firſt thought proper to embrace. The unwarlike crowd of attendants, whoſe ſervices were uſeleſs in time of action, gradually ſeized the ſame opportunity to leave the camp. The ſwelling multitude appeared as a ſecond army to the Spartans, who ſent a powerful detachment to oppoſe them. The fear of being cut off by the enemy threw them back on the Thebans, whoſe hopes were enlivened by the unexpected return of ſuch a conſiderable reinforcement. Thus encouraged, they determined unanimouſly to ſtand by their heroic chief, and either to defend their country, or to periſh in the attempt; and the ardour of the troops equalling the ſkill of the general, the union of ſuch advantages rendered them invincible.

Cleombrotus had diſpoſed his forces in the form of a creſcent, according to a favourite practice of the Spartans. His cavalry were poſted in ſquadrons along the front of the right wing, where he commanded in perſon. The allies compoſed the left wing, conducted by Archidamus. The Theban general, perceiving this diſpoſition, and ſenſible that the iſſue of the battle would eventually depend on the domeſtic troops of Sparta, determined to charge vigorouſly with his left, in order to ſeize or deſtroy the perſon of Cleombrotus; thinking that ſhould this plan ſucceed, the Spartans muſt be diſcouraged and repelled; and that even the attempt muſt occaſion diſorder in their ranks, as the braveſt would haſten, from every quarter, to defend the perſon of their king. Having reſolved, therefore, to commit the fortune of the day to the bravery of the left diviſion of his forces, he ſtrengthened it with the choiceſt of his heavy-armed men, whom he drew up fifty deep. The cavalry were placed in the van, to oppoſe the Spartan horſe. Pelopidas, with the Sacred Band, flanked the whole on the left; and deeming no particular ſtation too dangerous for their proweſs, they were prepared to appear in every tumult of the field, whither they might be called by an opportunity of ſucceſs, or by the proſpect of diſtinguiſhed danger. The principal inconvenience to which the Thebans were expoſed, was that of being ſurrounded by the wide-extended arms of the Spartan creſcent. This danger the general foreſaw; and in order to prevent it, he ſpread out his right wing, of which the files had only ſix men in depth, and the ranks proceeding in an oblique line, diverged the farther from the enemy, in proportion as they extended in length.

The action began with the cavalry, which, on the Spartan ſide, conſiſted chiefly of ſuch horſes as were kept for pleaſure by the richer citizens in time of peace; and which, proving an unequal match for the diſcipline of the Thebans, were ſpeedily broken, and thrown back on the infantry. Their repulſe occaſioned conſiderable diſorder in the Lacedæmonian ranks, which was greatly heightened by the impetuous charge of the Sacred Band. Epaminondas availed himſelf of this momentary confuſion, to perform one of thoſe rapid evolutions which commonly decide the fate of battles. He formed his ſtrongeſt but leaſt numerous diviſion into a compact wedge, with a ſharp point, and with ſpreading flanks; expecting that the Lacedæmonians, as ſoon as they had recovered their ranks, would attack the weaker and more extended part of his right wing. The event anſwered his expectation. While the Lacedæmonians advanced upon his right wing, where they found little reſiſtance, he ruſhed forward with his left; and darting like the beak of a galley on the flank of the enemy, bore down every thing before him, until he arrived at the poſt occupied by Cleombrotus. The urgency of the moment recalled to their ancient tactics the degenerate ſons of Lycurgus. The braveſt warriors flew from every quarter to the aſſiſtance of their prince, covered him with their ſhields, and defended him with their ſwords and lances. Their impetuous valour reſiſted the intrepid progreſs of the Thebans, till the Spartan horſemen, who attended the perſon of Cleombrotus, were totally cut off, and the king himſelf, pierced with many wounds, fell on the breathleſs boſoms of his generous defenders. The fall of the chief gave new rage to the battle. Anger, reſentment, and deſpair, by turns agitated the Spartans. But they could not obtain any further advantage. Epaminondas was careful to fortify his ranks, and to maintain his order of battle; and the firmneſs and rapidity of his regular aſſault gained a complete and deciſive victory over the deſperate reſiſtance of the Spartan troops. The allies had hitherto remained inactive, unwilling raſhly to engage in a battle, the motives of which they had never heartily approved. The defeat of the Lacedæmonians, and the death of Cleombrotus, decided their wavering mind. They determined with one accord to decline the engagement; their retreat was effected with the loſs of about two thouſand men; and the Thebans remained complete maſters of the field.

When the intelligence was diffuſed over Greece, that the Thebans, with the loſs of only three hundred men, had raiſed an immortal trophy over the ſtrength and renown of Sparta, the importance of this event became every where conſpicuous. The deſire, and hope, of a revolution in public affairs, filled the Peloponneſus with agitation and tumult. Eleans, Arcadians, and Argives, every people who had been influenced or intimidated by Spartan power, openly aſpired at independence. But amidſt this general defection, the Athenians exhibited an illuſtrious example of political moderation. Immediately after the battle of Leuctra, a Theban herald, adorned with the emblems of peace and victory, had been diſpatched to Athens, in order to relate the particulars of the engagement, and to invite the Athenians to an offenſive alliance againſt a republic, which had ever proved the moſt dangerous as well as the moſt inveterate enemy of their country. But the aſſembly of Athens, governed by the generoſity of Timotheus and Iphicrates, determined only to humble their rivals, not to deſtroy them. In this view they prepared to derive every poſſible advantage from the diſtreſs of Sparta, as well as to curtail its power. Convinced that the inhabitants of Peloponneſus would no longer be inclined to follow her ſtandard, and ſhare her adverſity, they ſeized the opportunity of delivering them for ever from her yoke; and, leſt any other people might attain the rank which the Spartans once held, and raiſe their own importance on the ruins of public freedom, ambaſſadors were ſent ſucceſſively to the ſeveral cities, requiring their reſpective compliance with the treaty of Antalcidas. Againſt ſuch as rejected this overture, war was denounced

denounced in the name of Athens and her allies; which was declaring to all Greece, that the battle of Leuctra had put the balance of power into her hands, and that ſhe had determined to check the ambition of every republic whoſe views were too aſpiring.

Diſappointed of the aſſiſtance of Athens, the Thebans courted an alliance with Theſſaly, then under the government of Jaſon of Pheræ, a man whoſe abilities and diſcernment were united with indefatigable labour and invincible courage. His family was deſcended from the ancient kings of the heroic ages, and formed the wealthieſt houſe in Pheræ. Taking a decided part with the Thebans, he adjuſted with equity and preciſion the proportion of taxes, and the contingent of troops, to be raiſed by the ſeveral cities in his dominions. The new levies, added to his ſtanding army of mercenaries, amounted to eight thouſand horſe, twenty thouſand heavy-armed foot, and ſuch a body of targeteers as no other ſtate could match. But numbers formed the leaſt advantageous diſtinction of the army of Jaſon. Every day he exerciſed his troops in perſon; diſpenſed rewards and puniſhments; caſhiered the ſlothful and effeminate; while he honoured and careſſed the brave and diligent. By this judicious plan the ſoldiers of Jaſon became alike attached to their duty, and to the perſon of their general, whoſe ſtandard they were ready to follow to any part of the world.

He began his military career by ſubduing the Dryopes, the Dolopians, and the other warlike tribes, inhabiting the mountains of Oeta and Pindus, which form the ſouthern frontier of Theſſaly. Then turning northwards, he ſtruck terror into Macedonia, and compelled Amyntas to become his ally. Thus fortified on both ſides, he retaliated the inroads of the Phocians, who had formerly inſulted the weakneſs of his country; and by conquering the ſmall and uncultivated diſtrict of Epirus, which then formed a barbarous principality under Alcetas, an anceſtor of the renowned Pyrrhus, he extended the dominion of Theſſaly from the Ægean to the Ionian ſea, and encompaſſed, as with a belt, the utmoſt breadth of the Grecian republics. He next engaged in a war with the Phocians, of which, whatever might be the pretence, the real object was to obtain the ſuperintendence of the Delphic oracle, and the adminiſtration of the ſacred treaſure. To avoid marching through a hoſtile territory, he ordered his galleys to be equipped, as if he had intended to proceed by ſea to the coaſt of Bœotia. His naval preparations amuſed the attention of the Phocians, while Jaſon entered their country with a body of two thouſand light horſe, and advanced with ſuch rapidity, that he was every where the firſt meſſenger of his own arrival.

By this unuſual celerity, he joined, without encountering any obſtacle, the army of the Thebans, who were encamped in the neighbourhood of Leuctra, at no great diſtance from the enemy. Inſtead of an auxiliary, Jaſon thought it at firſt more ſuitable to his intereſt to act the part of a mediator. He exhorted the Thebans to reſt ſatisfied with the advantages which they had already obtained, without driving their adverſaries to deſpair; that the recent hiſtory of their own republic and of Sparta, ſhould teach them to remember the viciſſitudes of fortune. The Lacedæmonians, on the other hand, he reminded of the difference between a victorious and a vanquiſhed army. That the preſent criſis ſeemed totally adverſe to the re-eſtabliſhment of their greatneſs; that they ſhould yield to the fatality of circumſtances, and watch a more favourable opportunity to reſtore the tarniſhed luſtre of their arms. His arguments prevailed; hoſtilities were ſuſpended; the terms of a peace were propoſed and accepted: but it is remarkable, that the Spartans and their allies had ſo little confidence in this ſudden negociation, that they decamped the night following, and continued to march homeward, with the diligence of diſtruſt and fear, until they got entirely beyond reach of the Thebans. Jaſon had not, probably, more confidence in a treaty haſtily concluded between enemies, whoſe reſentments were irritated and inflamed by ſo many mutual injuries offered and retorted. Nothing could have been more contrary to his views than a ſincere and laſting peace between theſe powerful republics; but as this was not to be apprehended, he wiſhed to obtain the reputation of appeaſing the diſſenſions of Greece; a circumſtance of great importance to the accompliſhment of his own deſigns.

In his return home, he demoliſhed the walls of Heraclea, a town ſituate near the ſtraits of Thermopylæ; not fearing, ſays his hiſtorian, that any of the Greek ſtates ſhould invade his dominions from that ſide, but unwilling to leave a place of ſuch ſtrength on his frontier, which, if ſeized by a powerful neighbour, might obſtruct his paſſage into Greece. Thither he determined to return at the celebration of the Pythian games, at which he meant to claim the right of preſiding, as an honour due both to his piety and to his power. But, amidſt theſe lofty projects, Jaſon, while reviewing the Pheræan cavalry, was ſtabbed by ſeven youths, who approached him on pretence of demanding juſtice againſt each other. Two of the aſſaſſins were diſpatched by his guards. Five mounted fleet horſes, which had been prepared for their uſe, and eſcaped to the Grecian republics, in which they were honoured as the ſaviours of their country from the ambitious deſigns of a tyrant. The projects and the empire of Jaſon periſhed with himſelf, and Theſſaly relapſed into its former ſtate of diviſion and weakneſs.

But this event ſtopped not the progreſs of the war. In the year before Chriſt 369, the renowned Thebans took the field, having carefully pondered their own ſtrength, and collected into one body the flower and vigour of their numerous allies. They were accompanied by the warlike youths of the towns and villages of Bœotia, by the Acarnanians, Phocians, Locrians, and Eubœans, and by a promiſcuous crowd of fugitives, who were attracted to their camp by the allurement of plunder. They had no ſooner arrived on the frontier of Arcadia, than they were joined by the inhabitants of that country, as well as by the Elians and Argives. This united ſtrength exceeded any numbers, that either before or afterwards ever aſſembled in Greece under one ſtandard, amounting to fifty, ſome ſay to ſeventy, thouſand men. The Thebans, and the reſt of the Bœotians, were commanded by Epaminondas and Pelopidas, to whom the generous admiration of their colleagues had voluntarily reſigned their authority. Appriſed of the march of ſuch a formidable army, conducted by generals of ſuch unqueſtionable merit, Ageſilaus prepared to evacuate Arcadia, a meaſure which he effected, before his ſoldiers beheld the fires kindled in the hoſtile camp, and thus avoided the diſgrace of retiring before the enemy. The Thebans in the mean time ſummoned a council of war, wherein it was determined to march without farther delay into the Lacedæmonian territories, to lay waſte the country, and, if poſſible, to take poſſeſſion of the capital.

That this reſolution might be executed with the greater celerity, the army was thrown into four diviſions, deſtined, by ſeparate roads, to break into the devoted province, to join forces again at Sellaſia, and thence to march in one body to Sparta. The Bœotians, Elians, and Argives, penetrated, without oppoſition, by the particular routes which had been aſſigned them. But when the Arcadians, who formed the fourth diviſion of the army, attempted to traverſe the diſtrict of Sciritis, the brave Iſchilas, who guarded that important paſs, determined to repel them, or to periſh. The example of Leonidas at Thermopylæ kindled a generous enthuſiaſm in the breaſt of this gallant Spartan. The number of the Arcadian levies ſo far exceeded his own, that inevitable death was the reſult of his courage.

Yet

Yet he exhorted all thoſe to decline the danger, who were not ambitious to ſhare in it. He even *commanded* the youth to leave his camp before the engagement, deeming their lives too precious to be expoſed in ſo deſperate an enterpriſe. He, with the veteran ſoldiers who followed him, choſe the preſent opportunity to meet a glorious death in defence of their country. But their lives were ſold dearly. The action was long doubtful; the loſs of the Arcadians great; nor did the battle ceaſe till the laſt of the Spartans had periſhed.

The confederates having ſoon after aſſembled at Sellaſia, the place of rendezvous, marched forward to Sparta, burning and deſtroying all before them. During five hundred years Laconia had not experienced a ſimilar calamity. The guards who defended the city were thrown into conſternation. The women were terrified by the ſmoke and tumult raiſed by the invaders; a ſpectacle, concerning which it had been their uſual boaſt, that they alone of all the Grecian females, had never beheld the theatre of war. Alarmed by the danger which threatened them, and which they were ſenſible of their own inability to repel, the Spartans embraced the expedient of giving arms to their peaſants and ſlaves, whom they commonly treated with ſuch an exceſs of cruelty. Not leſs than ſix thouſand of theſe unhappy men were engaged, by threats or promiſes, to undertake the defence of the proud tyrants whom they deteſted. Their formidable numbers increaſed the general panic, which had ſeized the magiſtrates and citizens, and which did not finally ceaſe until the arrival of a powerful body of men from Corinth, Phlius, Epidaurus, and Pallenè; cities which, though they had ever oppoſed the *deſpotiſm*, were unwilling to permit the *deſtruction*, of Sparta.

This ſeaſonable reinforcement not only removed the conſternation of the Spartans, but elevated their minds from the depth of deſpondency to the hope of ſucceſs. The kings and magiſtrates could ſcarcely reſtrain their impetuoſity from ruſhing into the field; and this martial enthuſiaſm, guided by the conſummate prudence of Ageſilaus, enabled them to repel the firſt aſſaults of the enemy, and convince them that the deſtruction of the Spartan government was no ſuch eaſy taſk. The conduct of Ageſilaus, during this critical emergency, has been highly extolled by all writers, and never beyond its merit. By a well-contrived ambuſh in the temple of the Tyndaridæ, he defeated the deſigns of the aſſailants: by very uncommon preſence of mind, he quelled a dangerous inſurrection; and while, by force or ſtratagem, he overcame the united efforts of domeſtic and foreign enemies, he negociated a moſt important treaty of alliance with the Athenians, who, in a crouded aſſembly, determined almoſt unanimouſly to take the field. Iphicrates was named general; twelve thouſand men were ordered to repair to his ſtandard; the troops took a ſhort repaſt; and ſuch was their ardour to meet the enemy, that many of them marched forth without waiting the orders of their commander. Epaminondas, meanwhile, committed dreadful devaſtation in Laconia. His repulſe from the capital exaſperated his vengeance againſt the country. He deſolated the fertile banks of the Eurotas, abounding in all the conveniencies of life known to the auſtere manners of Sparta. He aſſaulted Helos and Gythium; and, traverſing the whole province, deſtroyed the villages and inhabitants by fire and ſword. Even theſe terrible ravages did not ſatisfy his reſentment; he determined that the invaſion of Laconia ſhould not be a temporary evil, which the labour of a few years might repair; and for this purpoſe employed an expedient, which, even after he might evacuate their country, muſt leave the Lacedæmonians expoſed to the rage of an implacable enemy.

We have had occaſion to relate the various fortunes of the Meſſenians. About three centuries before the period now under review, their city had been demoliſhed by the Spartans; their territory had been ſeized, and divided among that people; the ancient inhabitants had been reduced into ſervitude, and compelled to cultivate their paternal fields for the benefit of cruel maſters; or diſperſed in miſerable baniſhment over Greece, Italy, and Sicily. After two centuries of humiliation and calamity, the humanity, or perhaps the policy, of Athens, took compaſſion on this unfortunate race, and ſettled them in the territory of Naupactus, and the neighbouring iſland of Cephalenia. The Meſſenians diſplayed their gratitude by important ſervices during the Peloponneſian war; but their moſt vigorous exertions could not then retard the declining fortune of Athens. The event of that war rendered Sparta the arbiter of Greece; and the Meſſenians were the firſt objects of her memorable tyranny, being univerſally enſlaved, baniſhed, or put to death. It is probable that the ſcattered remains of this miſerable community would flock from every quarter to the ſtandard of Epaminondas, rejoicing in an opportunity to retaliate the unrelenting perſecution of a people who now ſuffered themſelves the ſame calamities which they had ſo often inflicted on others. But the general voice of hiſtory aſcribes to Epaminondas the merit of aſſembling the Meſſenians. It is certain that he rebuilt their city, and put them in poſſeſſion of their territory; an act of generous compaſſion which inflicted a moſt unexpected puniſhment on the Spartans, who beheld the aſhes of a nation, which they had twice endeavoured to extinguiſh, now revive and flouriſh, never to be again ſubjected to their controul.

Epaminondas had accompliſhed this extraordinary enterpriſe, when he received intelligence of the motions of the Athenian army commanded by Iphicrates. That illuſtrious general had allowed the ardour of his troops to evaporate, by purſuing a conduct which it is impoſſible, at this diſtance of time, to explain, but which the military hiſtorian condemns, as highly unworthy of his former renown. His ſoldiers loudly demanded to meet the enemy, or even to aſſault the walls of Argos, the ſtrongeſt and moſt populous city in Peloponneſus, and not inferior to Thebes in animoſity againſt their common foe. Iphicrates, however, embraced none of thoſe meaſures, but led his army towards Arcadia; expecting, perhaps, what actually happened, that the news of his arrival there would deliver Laconia from the hoſtile invader. It cannot however be imagined, that Epaminondas feared the iſſue of an engagement with the Athenians. But he was juſtly alarmed with the intereſt which that people had taken in the affairs of Sparta. The indignation and reſentment which they, the rivals and enemies of the injured, diſcovered on this occaſion, taught him what ſentiments his conduct muſt excite in more impartial ſtates, ſhould he perſiſt in his plan to deſtroy Sparta; or, as the orator Leptines expreſſed it, "pluck out an eye of Greece." Many concurring cauſes tended alſo to accelerate his departure. The Arcadians were called home to defend their houſes and families. The Elians and Argives were anxious to ſecure their booty by an expeditious retreat. Even the Thebans were weary of an expedition which had conſumed ſeveral winter months, a ſeaſon in which they were not accuſtomed to keep the field.

Early in the enſuing ſpring, the Lacedæmonians, with the allies who ſtill adhered to their cauſe, diſpatched an embaſſy to Athens, in order to ſtrengthen the bands of amity with that republic. In the conference held for that purpoſe, it appeared that the Spartans were either very deeply affected by the recent obligations conferred on them, or that they very earneſtly deſired the continuance of ſimilar favours. They acknowledged that the experience, the bravery, the naval victories and fortune, of Athens, juſtly entitled her to the ſovereignty of the Grecian ſeas; and when this conceſſion, which had been long and diſdainfully withheld,

could not ſatisfy the more haughty members of the aſſembly, they condeſcended to propoſe, that in all ſuch military expeditions as were undertaken by the joint forces of both republics, the command ſhould be equal and alternate; ſo that an army of Lacedæmonians, a thing hitherto unexampled, would be commanded during half the campaign by Athenian generals. Patrocles the Phliaſian, whoſe eloquence and addreſs had been diſtinguiſhed in the former negociation, was not leſs active in the preſent; and an alliance of the moſt intimate kind was concluded between the two republics. The Spartan negociations, ſo fortunate in Athens, were alſo ſucceſsful with Dionyſius tyrant of Sicily, and Artaxerxes king of Perſia. The former, himſelf a Dorian, naturally lamented the humiliation and diſtreſs of a people, who, during ſeven hundred years, had formed the principal ornament and defence of the Dorian race; while the latter purſued his uſual ſyſtem of aſſiſting the weaker party, in order to balance the contending powers, and to perpetuate the hoſtilities of Greece.

While the Lacedæmonians gained ſtrength by theſe important alliances, their enemies took the field. The Arcadians began the campaign by entering the territory of Pallenè, which ſtill remained faithful to Sparta. The country was laid waſte, the villages burned, the city taken by ſtorm, and the garriſon, conſiſting of three hundred men, partly Lacedæmonians, put to the ſword. Soon after this ſucceſs, the Arcadians were joined by the Elians and Argives. Epaminondas likewiſe marched ſouthward at the head of the Thebans, their foot amounting to ſeven thouſand, and their cavalry to five hundred. Before he reached the Iſthmus, the Lacedæmonians had been reinforced by a body of two thouſand Sicilian troops, agreeably to their treaty with Dionyſius; and the Athenians had taken the field under the command of Chabrias, the moſt popular of their generals. It was the object of the Spartan and Athenian commanders, to prevent the junction of Epaminondas with his ſouthern allies. For this purpoſe they ſtrongly guarded the Iſthmus; an expedient which had not been put in practice ſince the expedition of Xerxes. The Thebans, however, reſolutely broke through, took Sicyon, and aſſaulted Corinth. But Chabrias, who at this time held the alternate command, repulſed them with ſuch loſs, that Epaminondas judged it proper to retire homeward; on which account he was ſhamefully diſgraced by his countrymen.

In the beginning of the year before Chriſt 367, the Spartan army again took the field. They received a freſh ſupply of troops from Dionyſius, and both troops and money from Artaxerxes. But the Theban troops commenced the campaign before them, and were actively employed in Theſſaly and Macedon; ſo that every circumſtance conſpired to ſtimulate Ageſilaus and the Lacedæmonians. But the infirmities incident to old age made him decline the command, which was intruſted to his ſon Archidamus; his colleague Ageſipolis not poſſeſſing the requiſite abilities either for war or government. The rapid ſucceſs of Archidamus ſoon juſtified the prudent choice of the magiſtrates and people. He expelled the hoſtile garriſons from the cities of Laconia, ſtormed Caryæ, and put the rebellious inhabitants to the ſword. From thence he haſtened to Arcadia, laid waſte the ſouthern frontier of that province, and prepared to attack the populous city of Parrhaſia, when the united ſtrength of the Arcadians, commanded by Lycomedes, and reinforced by the Argives, approached to its relief. As ſoon as Archidamus beheld the enemy prepared to engage, he commanded the Spartans to form, and addreſſed them as follows: "Fellow-citizens and friends! if we are ſtill brave, we may look forward with confidence; we may yet retrieve our affairs, and deliver down our republic to poſterity as we received it from our anceſtors. Let us ſtrive, then, by one noble effort, to recover our hereditary renown; and let us ceaſe being the reproach of our friends, our parents, our families, and our country." Animated by the heroiſm of their leader, they were tranſported with an enthuſiaſm of valour, and impetuouſly ruſhed againſt their opponents, in full confidence of victory. The enemy were diſmayed at their mien and aſpect as they advanced to the attack. The few who waited their approach were totally deſtroyed; many thouſands periſhed in the purſuit; it is ſaid by hiſtorians, that the Spartans loſt not a man. Archidamus erected a trophy, and diſpatched a meſſenger to Sparta. The people were aſſembled, when he communicated his extraordinary intelligence. The aged Ageſilaus ſhed tears of joy. The ephori and ſenators ſympathiſed with the emotions of their king. The patriotic weakneſs was communicated from breaſt to breaſt; the contagion ſpread; the ſterneſt members of this numerous aſſembly diſſolved in ſoftneſs, and melted in ſenſibility.

The Spartans were prevented from reaping the full fruits of their victory, by a conſiderable reinforcement which the Arcadians ſoon afterwards received from Thebes. By the aſſiſtance of theſe troops, the Menalians and Parrhaſians, who, from their ſituation on the ſouthern frontier of Arcadia, were moſt expoſed to the incurſions of the enemy, found means to execute a deſign ſaid to have been ſuggeſted by Epaminondas. They abandoned twenty ſtraggling and defenceleſs villages; and, chooſing an advantageous ſituation in the centre of their territory, erected a fortreſs, which they ſurrounded with a ſtrong wall. The benefit of ſecurity attracted new inhabitants; the walls were extended; the place acquired the name of Megalopolis, the laſt city built by the Greeks while they preſerved the dignity of independent government.

Epaminondas, who had for ſome time ſerved as a volunteer in the Theban ranks, was, in the beginning of the year before Chriſt 366, again reſtored to the chief command, and intruſted with a powerful army, with which, for the third time, he invaded the Peloponneſus. The Elians and Arcadians, though hoſtile to each other, were alike diſpoſed for rebellion againſt Thebes; but inſtead of marching into their territories, a meaſure which might have engaged them to ſettle their private differences, and to unite againſt Thebes, Epaminondas endeavoured to quaſh their diſaffection, by the rapid conqueſt of Achaia, which, ſtretching along the Corinthian gulph, ſkirted the northern frontiers of Elis and Arcadia. From the nature of their government, the Achæans uſually enjoyed more tranquillity than their neighbours. Towards the eaſt, and the Iſthmus of Corinth, the cities of Sicyon and Phlius had long been regarded as ſeparate republics, unconnected with the general body of the Achæan nation. Ægium enjoyed the prerogative of conſtituting the uſual place of convention for the ſtates of Achaia; but Dymè, Tirtæa, and Pallenè, ſcarcely yielded to Ægium in populouſneſs and power, and ſeem, with ſeveral places of inferior note, to have formed ſo many ſeparate and independent communities, all alike ſubject to the ſame ſyſtem of Achæan laws. Immediately before the Theban invaſion, the ariſtocracy had acquired an undue weight in the conſtitution of Achaia, ſo that the principal nobles and magiſtrates were no ſooner informed of the approach of an enemy, than they flocked from all quarters of the province to meet Epaminondas, ſoliciting his favour and friendſhip, little anxious about the independence of their country, provided they might preſerve their perſonal privileges and private fortunes. The people, perceiving themſelves betrayed by thoſe who ought to have been their protectors, abandoned all thoughts of reſiſtance. Epaminondas accepted the ſubmiſſion of the magiſtrates, and received pledges of their engagement, that Achaia ſhould thenceforth adhere to the intereſt of Thebes, and follow the ſtandard of that republic.

This

This conqueſt, though effected without ſtriking a blow, was deſtructive and ſanguinary in its conſequences. Epaminondas, for reaſons not ſufficiently explained, returned with his army to Thebes; but before he arrived there, various complaints againſt his conduct had been made in the Theban aſſembly. The Arcadians and Argives complained that a people, who knew by their own recent experience the inconveniences of ariſtocracy, ſhould have confirmed that ſevere form of government in a dependent province. The democratic faction in Achaia ſecretly ſent emiſſaries to ſecond the complaint. The enemies of Epaminondas ſeized the favourable opportunity of accuſing and calumniating that illuſtrious commander, and the capricious multitude were perſuaded to condemn his proceedings, and to ſend commiſſioners into Achaia, who, with the aſſiſtance of the populace, as well as of a conſiderable body of mercenaries, diſſolved the ariſtocracy, baniſhed or put to death the nobles, and inſtituted a democratic form of government. The foreign troops had ſcarcely left that country, when the exiles, who were extremely numerous and powerful, returned with common conſent, and, after a bloody and deſperate ſtruggle, recovered their ancient influence in their reſpective cities. The leaders of the populace were now, in their turn, put to death or expelled; the ariſtocracy was re-eſtabliſhed; and the magiſtrates, knowing that it was dangerous to depend on the unſteady politics of Thebes, craved the protection of Sparta, which was readily granted them. The Achæans approved their gratitude by ravaging the northern, while the Lacedæmonians infeſted the ſouthern, frontier of Arcadia; and that unhappy province ſeverely felt and regretted the fatality of its ſituation between two implacable enemies.

Meanwhile, the war languiſhed on both ſides, till the hoſtile confederacies were on the point of being diſſolved. The Athenians and Arcadians, equally diſguſted with their reſpective allies, concluded a treaty of peace and mutual defence, by the intervention of Lycomedes the Mantinæan, who was ſlain in his return from Athens by a party of Arcadian exiles. This negociation gave general alarm; the Arcadians, who had entered into a treaty with Athens, were the allies of Thebes; and the united ſtrength of theſe three republics was at that time ſufficient to ſubdue and enſlave the reſt of Greece. The terror was increaſed when it appeared that the Athenians had little inclination to evacuate ſeveral places in the Corinthian territory which they had undertaken to defend againſt the Arcadians and Thebans. By ſeaſonable vigilance the Corinthians anticipated a deſign, too unjuſt to be publicly avowed; they cautiouſly diſſembled their fears; graciouſly thanked Chares, who had arrived with an Athenian fleet on pretence of offering them his ſervice, but took care not to admit him within their harbours; and by extreme kindneſs and condeſcenſion, accompanied with warm profeſſions of gratitude for the protection hitherto afforded them, they got rid of the foreign garriſons, without coming to an open rupture with the Athenians. But the narrow eſcape which they had made, and the dread of being expoſed in future to any ſimilar danger, made them extremely ſolicitous to promote a general peace on the terms propoſed by the Thebans, which were, that Sparta ſhould declare and admit the future independence of the fertile country of Meſſenia. Motives of the ſame kind influenced the cities of Achaia, and the little republic of Phlius, which, together with Corinth, were the only allies that remained faithful to Sparta. A ſimilarity of intereſts occaſioned a cloſe communication of views and meaſures among all thoſe communities; who agreed, by common conſent, to diſpatch an embaſſy to Sparta, requeſting that ſhe would accept theſe conditions of peace; or if ſhe thought it inconſiſtent to cede her pretenſions to Meſſenè, that ſhe would allow her faithful allies to enter into a ſeparate negociation with the Theban republic.

The reaſonableneſs of this requeſt muſt have been apparent to the Spartans, when they reflected on the uſeful ſervices of the allies, and conſidered how much they had already ſuffered in their cauſe. The Phliaſians, in particular, had, during five years, given ſuch illuſtrious proofs of their unſhaken adherence to Sparta, as ſtand unrivalled in the hiſtory of national fidelity. Situated in the midſt of enemies, they had continually, ſince the battle of Leuctra, ſuffered the invaſions and aſſaults of the Thebans, Arcadians, and Argives. Their territory was totally waſted; their city cloſely beſieged; their citadel more than once ſurpriſed and taken; their wealth, public and private, was exhauſted; and they ſubſiſted precariouſly on proviſions brought from Corinth, for the payment of which they had pledged their beaſts of burden and inſtruments of agriculture. Yet, under the preſſure of theſe multiplied calamities, they had preſerved their fidelity inviolate; they had diſdained to accept the peace which the Thebans offered them on condition of their forſaking Sparta; even, at laſt, they were determined to negociate with Thebes for neutrality alone; nor had they ſolicited permiſſion to embrace this meaſure, until Corinth, the only ſource of their ſubſiſtence, ſeemed ready to forſake them.

The ſtrength of ſuch arguments, urged by the eloquence of Patrocles the Phliaſian, might have ſoftened, if any thing could have ſoftened, the inflexible temper of the Spartan ſenate, and diſpoſed that aſſembly to prefer the intereſt of their allies, and their own immediate ſafety, to the doubtful proſpect of recovering Meſſenè. But the ſpeech of Archidamus, full of animation and contempt for the foes of Sparta, decided their perſeverance in the war. "The Phliaſians, the inhabitants of Corinth and Achaia, may, without exciting ſurpriſe, expreſs an anxiety for peace; ſafety, not glory, being their aim. But the Spartans have a character to ſuſtain, which it would be diſhonourable to relinquiſh. They expect not barely to exiſt, but to enjoy glory and renown, the true ſweeteners of exiſtence; and, if that be impoſſible, they muſt periſh! Yet is not their ſituation deſperate: a nation can never be reduced to any condition of diſtreſs, in which a warlike genius, and a well-regulated government, may not afford relief. But in military experience and abilities, we are ſtill unrivalled; and ſuch a ſyſtem of policy as we enjoy, no other people can boaſt. We enjoy, beſides, temperate and laborious habits, the contempt of pleaſure and wealth, an ardour for martial glory, and an ambition for honeſt fame. Theſe are powerful auxiliaries, when protected by the immortal gods, whoſe oracles anciently approved our juſt conqueſt of Meſſenè. Nor, though the Corinthians and Achæans forſake us, ſhall we be deſtitute of allies. The Athenians, ever jealous of Thebes, their moſt formidable neighbour, will again take arms in our cauſe. Dionyſius, the tyrant of Sicily, gives us hope of farther aſſiſtance; the king of Egypt, and many princes of Aſia, declared enemies of Artaxerxes, are all naturally our friends. We poſſeſs, beſides, though not the perſons and actual ſervice, the hearts and affections at leaſt, of whatever is moſt eminent in Greece. But had we nothing of this kind to boaſt, and were the one half of Greece not more diſpoſed to injure us, than the other to abet their injuſtice, I have ſtill one alternative to propoſe, harſh indeed and ſevere, but becoming thoſe ſentiments which have ever animated the Spartans. Proſperity, that conceals the infamy of cowardice, robs fortitude of half its glory. It is adverſity alone that can diſplay the full luſtre of a firm and manly character. I propoſe, therefore, that rather than cede a territory, which your anceſtors acquired by the blood and labour of twenty campaigns, you ſhould remove from Sparta your wives, children, and parents, who will be received

with

with kindneſs in Italy, Sicily, Cyrenè, and many parts of Aſia. Thoſe who are fit to bear arms muſt alſo leave the city, and carry nothing from thence that may not eaſily be tranſported. They muſt, then, fix on ſome poſt well fortified by nature, and which art may render ſecure againſt every hoſtile aſſault. This, henceforth, muſt be their city and country; and from this, as a centre, they muſt on all ſides infeſt the enemy, until either the Thebans remit their arrogance, or the laſt drop of the Spartan blood periſh."

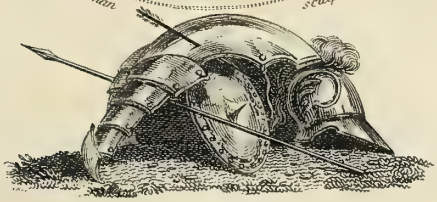
The ſpeech of Archidamus expreſſed the general ſenſe of his country. The allies were diſmiſſed with permiſſion to act as beſt ſuited their convenience, but with aſſurance that Sparta would never liſten to any terms of accommodation while deprived of Meſſenè. With this anſwer the ambaſſadors returned to their reſpective cities. Soon afterwards they were diſpatched to Thebes, where, having propoſed their demands, they were offered admiſſion into the Theban confederacy. They anſwered, that this was not peace, but only a change of the war; and at length, after various propoſitions and reaſoning, they obtained the much-deſired neutrality.

The Spartans, thus deſerted on every ſide, would probably have been the victims of their pride and obſtinacy, if circumſtances unforeſeen had not prevented the Thebans and Arcadians from carrying on the war with their uſual ſucceſs. Projects of glory and ambition had diſarmed the reſentment of Epaminondas. That active and enterpriſing leader, who thought that nothing was done while any thing was neglected, had ſet himſelf to render Thebes miſtreſs of the ſea. The attention and labour of the republic were directed to this new object; preparations were made at Aulis with ſilence and celerity; and when the deſign ſeemed ripe for execution, Epaminondas ſailed to Rhodes, Chios, and Byzantium, to concert meaſures with thoſe maritime ſtates, which had already begun to ſhake off the yoke of the Athenians. But the vigilance of the latter, who had ſent out a ſtrong fleet under Laches, a commander of reputation and ability, prevented the dangerous conſequences of this defection; and the Theban arms were, at the ſame time, ſummoned to a ſervice which more immediately concerned their intereſt and honour.

Alexander, the tyrant of Pheræ, in the year before Chriſt 364, having entered into an alliance with Athens, he was thus enabled to attack the principal cities of Theſſaly, and to lay waſte the whole territory. The oppreſſed Theſſalians had recourſe to Thebes, whoſe powerful protection they had ſo happily experienced on former occaſions, and whoſe ſtandard they had uniformly followed, with an alacrity which afforded a ſufficient pledge of their gratitude. The Thebans decreed to aſſiſt them with ten thouſand men, and the command was entruſted to Pelopidas, the perſonal enemy of Alexander, who inſtantly marched into Theſſaly; and, being joined by the allies near the town of Pharſalus, they encamped at the foot of the mountains of Cynoſcephalæ. The tyrant Alexander approached with an army of twenty thouſand men, boldly offering battle. Nor did Pelopidas decline the engagement, though his troops were, in number, inferior to the enemy. The action began with the cavalry, and was favourable to the Thebans; but the mercenaries of Alexander, having gained the advantage of the ground, preſſed with vigour the Theban and Theſſalian infantry. In this emergency, Pelopidas rode up, and, encouraging the retiring troops with his voice and action, gave them ſuch freſh ſpirits, that Alexander did not doubt their having received a conſiderable reinforcement. The mercenaries were preſſed in their turn, and thrown into diſorder. Pelopidas, darting his eye through their broken ranks, eſpied Alexander in the right wing, rallying his men, and preparing to advance with his uſual intrepidity. At this ſight the Theban, accompanied by a few horſemen, impetuouſly ruſhed forward, calling aloud to his adverſary, and challenging him to ſingle combat. Alexander, overcome with fear, retired behind his guards, who received, firſt with a ſhower of javelins, and then with their ſpears, the little band of Pelopidas; who, after a dreadful carnage, fell a victim to his own ungovernable fury. Meanwhile, his troops advancing to the relief of their general, the guards of the tyrant were repelled; the Thebans, with their allies, proved victorious in every part of the battle; the enemy were diſperſed in flight, and purſued with the loſs of three thouſand men. But the death of Pelopidas threw a gloom over the victory. He was lamented by the Thebans and Theſſalians with heartfelt ſorrow. Accompanied by an innumerable crowd of mourners, his body was carried in proceſſion to Thebes. The Theſſalians, in whoſe ſervice he had fallen, requeſted the honour of ſupplying the expences of his funeral, which was celebrated with every circumſtance of ſolemn magnificence. The Thebans appointed Malcitas and Diogeiton to the command in Theſſaly; and the tyrant Alexander was again defeated, and ſtripped of all his poſſeſſions except Pheræ; while the neighbouring cities entered into a cloſe alliance with Thebes.

While operations, deſtructive or fruitleſs, employed the activity of Thebes, her allies in Arcadia were occupied with a deſign extremely unpardonable. To pave the way for the total conqueſt of the Peloponneſus, in which they had already obtained an aſcendant, they began by wreſting ſeveral places from the Elians, the leaſt warlike, and moſt wealthy, of their neighbours. The Elians, worſted in every encounter, craved the aſſiſtance of Sparta, which, being reinforced by the Achæans, (notwithſtanding the neutrality ſo recently ſtipulated,) made ſeveral vigorous but unſucceſsful efforts for the defence of the Elian territory. The Arcadians ſtill puſhed their conqueſts in that country, gaining one town after another, until at length Olympia itſelf fell into their hands. As poſſeſſors of this ſacred city, and by virtue of a pretended right derived from the inhabitants of Piſa, an ancient but decayed place in the neighbourhood of Olympia, the Arcadians prepared to celebrate the hundred and fourth Olympiad, the era of which was at hand. At the approach of this auguſt ſolemnity, the concourſe, as uſual, was great from every part of Greece; hoſtilities were ſuſpended; and all parties united in common amuſements, and common ceremonies of religion.

The prayers and ſacrifices were performed, and the military games had begun, when the ſpectators were alarmed by the ſudden claſhing of armour, and the fight of a real battle. The Elians had marched forth with their whole forces, and ſurpriſed the Arcadians, who, with two thouſand Argives, and a body of Athenian cavalry amounting to four hundred, guarded the ſacred groves and temples of Olympia. The vigour of their unexpected aſſault ſucceſſively repelled theſe intruders, who fled in diſorder through the ſtreets, and were purſued by the Elians with an inſpired valour, "ſince," ſays Xenophon, "Heaven alone can do, in one day, what no other power can accompliſh but in great length of time; make cowards courageous." The Arcadians, however, recovering from their conſternation, began to rally. The aſſailants were reſiſted with obſtinacy; but did not retire, till having loſt Stratolas their commander, with other brave men, they retreated in good order, after giving a conſpicuous proof of their courage and intrepidity to thoſe who had long deſpiſed their unwarlike character. The Arcadians renewed the guard with double vigilance; fortified the avenues that led to the Stadium and Hippodrome; and having taken theſe neceſſary precautions againſt a ſecond ſurpriſe, proceeded with the remaining ceremonies of the feſtival, which, though brought to an undiſturbed concluſion, was never acknowledged in the records of the Elians. And after celebrating the Olympic games, the Arcadians, in full aſſembly,



EPAMINONDAS.

London. Published as the Act directs

aſſembly, reflecting on the ſacrilegious violence that had been offered by their troops to the ſacred ſhrine of Olympia, determined to reſtore that city, as well as the direction of the games, to thoſe who had, from time immemorial, enjoyed both, and to conclude a peace with the Elians, who ſolicited it with much earneſtneſs, as a meaſure highly conducive to the general intereſt of the Peloponneſus.

After theſe tranſactions, Epaminondas took the field with the Bœotians, Eubœans, and a ſtrong body of Theſſalians; and upon his arrival in the Peloponneſus, he expected to be joined by the Argives, the Meſſenians, and ſeveral communities of Arcadia, particularly the inhabitants of Tegea and Megalopolis. With theſe hopes, he proceeded ſouthward to Nemea, where he encamped for ſeveral days, with an intention to intercept the Athenians, whoſe neareſt route into Peloponneſus lay through the diſtrict of Nemea. But this ſcheme was defeated by the prudence of the Athenians, who, inſtead of marching through the Iſthmus, ſailed to the coaſt of Laconia, and proceeded from thence to join their confederates at Mantinæa. When appriſed of this deſign, Epaminondas moved his camp, and marched forward to Tegea, which being ſtrongly fortified, and enjoying a lofty and central ſituation, was judiciouſly choſen as the place of rendezvous for his Peloponneſian confederates. The ſtrength of the enemy at Mantinæa was continually increaſing. Ageſilaus had already conducted the Lacedæmonians to the frontier of Arcadia. If they likewiſe ſhould join, the combined forces would prove ſuperior to the army of Epaminondas, which amounted to thirty thouſand in number, and of which the cavalry alone exceeded three thouſand. Conſidering theſe circumſtances, he determined on an enterpriſe, which, if crowned with ſucceſs, would render the preſent hitherto fruitleſs expedition not unworthy of his former fame.

Having decamped with his whole army in the night, he performed a haſty march of thirty miles, in order to ſurpriſe Sparta; and had not the extraordinary ſwiftneſs of a Cretan deſerter appriſed Ageſilaus of the danger, that city would have been taken unprepared, and totally incapable of defence. The bulk of the Lacedæmonian army had proceeded too far on the road to Mantinæa, to anticipate the deſign of the enemy; but the aged king, with his ſon Archidamus, returned, with a ſmall but valiant band, to the defence of Sparta. The engagement which followed, as related by Xenophon, appears one of the moſt extraordinary that hiſtory records. Epaminondas had employed every precaution which his ſagacity could ſuggeſt; he did not approach Sparta by thoſe narrow roads, where a ſuperiority of numbers would afford him ſmall advantage; he did not draw up his forces in the plain, in which, while entering the town, they might have been annoyed with miſſile weapons; nor did he allow an opportunity of ſurpriſing him by ſtratagem or ambuſcade, in the management of which the Spartans were at all times ſo dexterous. Seizing an eminence which commanded the town, he determined to deſcend into it with every advantage on his own ſide, and without the ſeeming poſſibility of being expoſed to any inconvenience. But the iſſue of ſo well-concerted an enterpriſe, the hiſtorian heſitates whether to refer to a particular providence of the gods, or to aſcribe to the invincible courage of men actuated by deſpair. Archidamus, with ſcarcely an hundred men, oppoſed the progreſs of the enemy, cut down the firſt ranks, and advanced to aſſault the remainder. Then, ſays Xenophon, "thoſe Thebans who had ſo often conquered, who were far ſuperior in number, and who poſſeſſed the advantage of the ground, ſhamefully gave way. The Spartans purſued them with impetuoſity, but were ſoon repelled with loſs; for the divinity, whoſe aſſiſtance had produced this extraordinary victory, ſeems alſo to have preſcribed the limits beyond which it was not to extend."

Epaminondas, foiled in an attempt which promiſed ſuch a fair proſpect of ſucceſs, did not ſink under his diſappointment. As he had reaſon to believe that the whole forces at Mantinæa would be withdrawn from that place to the defence of Sparta, he immediately founded a retreat, returned to Tegea with the utmoſt expedition, and allowing his infantry time for reſt and refreſhment, ordered the horſe to advance forward to Mantinæa, (which was diſtant only twelve miles,) and to maintain their ground until his arrival with the reſt of the army. He expected to find the Mantinæans totally unprepared for ſuch a viſit; and as it was then autumn, he doubted not that moſt of the townſmen would be employed in the country, in reaping and bringing in the corn. His plan was wiſe, and well executed. The ſituation of the Mantinæans correſponded to his hopes. But it ſeemed as if fortune had delighted to baffle all his enterpriſes. Before the Theban forces arrived at Mantinæa, a numerous ſquadron of Athenian cavalry entered that place, commanded by Hegelochus, who then firſt learned the departure of the allies to protect the Lacedæmonian capital. He had ſcarcely received this intelligence, when the Thebans appeared, and, advancing with great rapidity, prepared to effect the purpoſe of their expedition. The Athenians had not time to refreſh themſelves; they were inferior in number; they knew the bravery of the Theban and Theſſalian cavalry, with whom they muſt contend; yet, regardleſs of every conſideration but the ſafety of their allies, they ruſhed into the field, ſtopped the progreſs of the aſſailants, and, after a fierce and bloody engagement, which diſplayed great courage on both ſides, obtained an acknowledged victory. The enemy craved the bodies of their dead; the victors erected a trophy of their uſeful valour, which had ſaved Mantinæa from falling a prey to the invaders.

The repeated misfortunes, which would have broken the ſpirit of an ordinary commander, now determined Epaminondas to bring on a general engagement. The confederates had re-aſſembled at Mantinæa, ſtrengthened by conſiderable reinforcements. Freſh ſuccours had likewiſe arrived to the Thebans. Never had ſuch numerous armies taken the field during the perpetual wars in which thoſe unhappy republics were engaged. Epaminondas, after ranging his men in battalions, led them on towards Mantinæa. The enemy, appriſed of his march, drew up their forces before the walls; the Lacedæmonians and Arcadians in the right wing, the Athenians in the left, the Achæans and Elians in the centre. Meanwhile Epaminondas, marching ſlowly along, extended his circuit as if he wiſhed to decline the engagement. This opinion, too lightly conceived, proved fatal to the enemy. They abandoned their arms and their ranks, diſperſed in their tents, and loſt not only that external arrangement, but that inward preparation, that martial ardour of mind, which ought to animate ſoldiers at the near proſpect of an engagement. Epaminondas ſeized the deciſive moment of attack. Facing to the right, he converted the column of march into an order of battle. His troops were thus diſpoſed inſtantaneouſly in the ſame order in which he meant to fight. At the head of his left wing, which conſiſted of the flower of the Bœotians, and which, as at the battle of Leuctra, he formed into a firm wedge with ſpreading flanks, he advanced againſt the Spartans and Mantinæans; and truſting the event of the battle to the rapid impulſe of this unexpected onſet, he commanded the centre and right wing, in which he placed leſs confidence, to proceed with a ſlow pace, that they might not come up and grapple with the oppoſing diviſions of the enemy, until the victory of his left wing had taught them to conquer. This judicious deſign was crowned with ſucceſs. The enemy, perceiving the dreadful ſhock to which they were expoſed, flew to their arms, and ſuddenly reſumed their ranks; but theſe operations were

performed with the trepidation of ſurpriſe and haſte, rather than with the ardour of hope and courage; and the whole army had the appearance of men prepared rather to ſuffer, than to inflict, any thing terrible or deciſive. The Spartans and Mantinæans, however, drawn up in firm order, ſternly waited the firſt onſet of the aſſailants. The battle was fierce and cruel; and after their ſpears were broken, both parties had recourſe to their ſwords. The wedge of Epaminondas at length forced the Spartan line, and this advantage encouraged his centre and right wing to attack and repel the correſponding diviſions of the enemy. The Theban and Theſſalian cavalry were equally ſucceſsful. In the intervals of their ranks Epaminondas had placed a body of light infantry, whoſe miſſile weapons greatly annoyed the enemy's horſe, who were drawn up two deep. He had likewiſe taken the precaution to occupy a riſing ground on his right with a conſiderable detachment, which might take the Athenians in flank and rear, ſhould they advance from their poſt. Theſe prudent diſpoſitions produced a victory, which Epaminondas did not live to improve. In the heat of the battle he received a mortal wound, and was carried to an eminence, which was afterwards called the Watch-tower, probably that he might the better obſerve the ſubſequent operations of the field. But with the departure of their leader was withdrawn the ſpirit which animated the Theban army. Having impetuouſly broke through the hoſtile ranks, they knew not how to profit by this advantage. The enemy rallied in different parts of the field, and prevailed in ſeveral partial encounters. All was confuſion and terror. The light infantry, which had been poſted amidſt the Theban and Theſſalian horſe, being left behind in the purſuit, were received and cut to pieces by the Athenian cavalry, commanded by Hegelochus. Elated with this ſucceſs, the Athenians turned their arms againſt the detachment placed on the heights, conſiſting chiefly of Eubœans, whom they routed and put to flight, after a terrible ſlaughter. With ſuch alternations of victory and defeat ended this memorable engagement. Both armies, as conquerors, erected a trophy; both craved their dead, as conquered; and this battle, which, being certainly the greateſt, was expected to prove the moſt deciſive, ever fought among the Greeks, produced no other conſequence than that general langnor and debility long remarkable in the ſubſequent operations of thoſe hoſtile republics.

When the tumult of the action ceaſed, the moſt diſtinguiſhed Thebans aſſembled round their dying general. His body had been pierced with a javelin; and the ſurgeons declared, that it was impoſſible for him to ſurvive the extraction of the weapon. He aſked whether his ſhield was ſafe; which being preſented to him, he viewed it with a languid ſmile of melancholy joy. He then demanded, whether the Thebans had obtained the victory. Being anſwered in the affirmative, (for the Lacedæmonians indeed had firſt ſent to demand the bodies of their ſlain,) he declared himſelf ready to quit life without regret, ſince he left his country triumphant. The ſpectators lamented, among other objects of ſorrow, that he ſhould die without children, who might inherit the glory of his name, and the fame of his virtues. "You miſtake," ſaid he, with a cheerful preſence of mind; "I leave two fair daughters, the battles of Leuctra and Mantinæa, who will tranſmit my renown to the lateſt ages." So ſaying, he ordered the weapon to be extracted, and immediately expired. The awful ſolemnity of his death correſponded with the dignified ſplendour of an active and uſeful life. He is uſually deſcribed as a perfect character; nor does the truth of hiſtory oblige us to detract any thing from this deſcription. He was buried in the field of battle, where his monument ſtill exiſted, after four centuries, in the time of Pauſanias, with an inſcription in elegiac verſe, enumerating his exploits. Adrian, then maſter of the Roman world, added a ſecond column, with a new inſcription, in honour of a character, whom that celebrated emperor had genius to admire, but wanted firmneſs to imitate.

Soon after the battle of Mantinæa, in the year before Chriſt 362, a general peace was propoſed under the mediation of Artaxerxes, who wanted Grecian auxiliaries to check the inſurrections in Egypt and Leſſer Aſia, which diſturbed the two laſt years of his reign. The only condition annexed to this treaty was, that each republic ſhould retain its reſpective poſſeſſions. The Spartans determined to reject every accommodation until they had recovered Meſſenia; and as Artaxerxes had uniformly oppoſed this demand, they tranſported forces into Egypt, to foment the defection of that province. At the head of a thouſand heavy-armed Lacedæmonians, and ten thouſand mercenaries, Ageſilaus ſupported one rebel after another, having ſucceſſively ſet on the throne Taches and Nectanebus. In this diſgraceful war he amaſſed conſiderable wealth, by means of which he probably expected to retrieve the affairs of his country. But returning home by Cyrenaica, in the year before Chriſt 361, he died on that coaſt, in the eighty-fourth year of his age, and forty-firſt of his reign. He was the greateſt, and the moſt unfortunate, of the Spartan kings. He had ſeen the higheſt grandeur of Sparta, and he beheld her fall. During the time that he governed the republic, his country ſuffered more calamities and diſgrace than in ſeven centuries preceding his reign. His ambition and his obſtinacy, doubtleſs, contributed to her diſaſters; yet ſo natural were the principles from which he acted, ſo probable his hopes of ſucceſs, and ſo firm and manly his ſtruggles for victory, that a contemporary writer, who could ſee through the cloud of fortune, ventured to beſtow on Ageſilaus a panegyric, which exalts him beyond the renown of his moſt illuſtrious predeceſſors.

With the battle of Mantinæa ended the bloody ſtruggle for dominion, which had long exhauſted Thebes and Sparta. No Theban aroſe to emulate the magnanimity of Epaminondas; nor did Archidamus, who ſucceeded to the Spartan throne, juſtify the high opinion conceived of his early wiſdom and valour. Weakened by their wounds, and worn down by exertions which exhauſted their ſtrength, thoſe republics ſunk into a ſtate of ſupineneſs, which encouraged the pretenſions of neighbours who had long waited for ſuch an event. While this unuſual deſpondency ſtrengthened the fœderal union, and tended to reſtore the primitive equality, of the Grecian ſtates, various circumſtances concurred to revive the aſpiring ambition of Athens. During the Bœotian war, the Athenians had acted as auxiliaries only; without making ſuch efforts as enfeebled their ſtrength, their arms had acquired freſh luſtre. Their powerful rivals were humbled; experience had taught them the danger of attempting to ſubdue, and the impoſſibility of keeping in ſubjection, the territories of their warlike neighbours: but the numerous iſlands of the Ægean and Ionian ſeas, the remote coaſts of Thrace and Aſia, invited the activity of their fleet, which they might now employ in foreign conqueſts, fearleſs of domeſtic envy. It appears, that ſoon after the death of Epaminondas, Eubœa again acknowledged the authority of Athens; an event facilitated by the deſtruction of the Theban partiſans belonging to that place, in the battle of Mantinæa. From the Thracian Boſphorus to Rhodes, ſeveral places along both ſhores ſubmitted to the arms of Timotheus, Chabrias, and Iphicrates; men, who having ſurvived Ageſilaus and Epaminondas, were far ſuperior in abilities to the contemporary generals of the other republics. The Cyclades and Corcyra courted the friendſhip of a people who were at once either to protect or deſtroy their navigation and commerce. Byzantium had become their ally, and there was reaſon to hope that Amphipolis would ſoon be rendered their ſubject. Such multiplied advantages revived the ancient grandeur of Athens, which

which once more commanded the ſea, with a fleet of near three hundred ſail, and employed the beſt half of her citizens and ſubjects in ſhips of war or of commerce. Yet idleneſs, and luxury, and diſſipation, ſeem to have been the only reſults which followed from this pre-eminence of the Athenian republic; and it required only a daring and profligate leader to involve them in freſh wars and extravagant ſpeculations. Such a perſonage preſented himſelf in Chares, whoſe ſoldier-like appearance and impetuous valour maſked his ambition, and rendered him the idol of the populace. Though an enterpriſing and ſucceſsful partiſan, he was unacquainted with the great duties of a general; and his defects appear the more ſtriking, when compared with the abilities of Iphicrates and Timotheus, his contemporaries, who prevailed as often by addreſs as by force, and whoſe conqueſts were ſecured to the republic by the moderation and humanity with which they had been obtained, and with which they continued to be governed.

Chares propoſed a new and moſt unjuſtifiable mode of adminiſtration: he exhorted his countrymen to ſupply the defects of their treaſury, and to acquire the materials of thoſe pleaſures which they regarded as eſſential to their happineſs, by plundering the wealth of their allies and colonies. This counſel was too faithfully obeyed; the vexations, anciently exerciſed againſt the tributary and dependent ſtates, were renewed and extended to a moſt alarming and oppreſſive degree. The weaker communities remonſtrated againſt this intolerable oppreſſion; while the iſlands of Chios, Coos, Rhodes, as well as the city of Byzantium, prepared openly to revolt, and engaged with each other to repel force by force, until they ſhould obtain peace and independence, or periſh with their liberty and property. Chares, who treated with contempt this formidable reſolution of the people, was ſent out with a powerful fleet and army to quaſh at once the hopes of the inſurgents; and thus, in the year before Chriſt 358, commenced the third Social War. He ſailed towards Chios, with an intention to ſeize the capital of that iſland, which was ſuppoſed to be the centre of the rebellion. The confederates, informed of his motions, had already drawn thither the greateſt part of their force. The city of Chios was beſieged by ſea and land. The iſlanders defended themſelves with vigour. Chares found it difficult to repulſe their ſallies. His fleet attempted to enter their harbour, but without ſucceſs; the ſhip of Chabrias alone penetrated thus far; and that able commander, whoſe valour and integrity merited a better fortune, though deſerted by the fleet, yet forſook not the ſhip intruſted to him by the republic. His companions threw away their ſhields, and ſaved themſelves by ſwimming to the Athenian ſquadron, which was within their reach. But Chabrias, fighting bravely, fell by the darts of the Chians, preferring an honourable death to a diſgraceful life.

Encouraged by theſe advantages, the inſurgents augmented their fleet, and ravaged the iſles of Lemnos and Samos. The Athenians, indignant that their power and authority ſhould have been thus foiled, fitted out, early in the next ſpring, a new armament under the command of Mneſtheus, the ſon of Iphicrates, and ſon-in-law of Timotheus, expecting that the new commander would more cordially co-operate with thoſe great men, who perhaps declined acting as principals in an expedition where Chares any longer poſſeſſed a ſhare of authority. That general had raiſed the ſiege of Chios, and now cruiſed in the Helleſpont; where, being joined by Mneſtheus, the united ſquadrons amounted to an hundred and twenty ſail. It was immediately determined to cauſe a diverſion of the enemy's forces from Samos and Lemnos, by laying ſiege to Byzantium. The deſign ſucceeded; the allies withdrew from theſe iſlands, collected their whole naval ſtrength, and prepared vigorouſly for defending the principal city in their confederacy. The hoſtile fleets approached each other, with a reſolution to join battle, when a ſudden and violent ſtorm aroſe, which rendered it impoſſible for the Athenians to bear up to the enemy, or even to keep the ſea, without being expoſed to the dangers of ſhipwreck. Chares alone confidently inſiſted on commencing the attack, while the other commanders, more cautious and experienced, perceived the diſadvantage, and declined the danger. His impetuoſity, thus over-ruled by the prudence of his colleagues, was converted into reſentment and fury; he called the ſoldiers and ſailors to witneſs their oppoſition, which he branded with every odious epithet of reproach; and, with the firſt opportunity, diſpatched meſſengers to Athens, to accuſe them of incapacity, cowardice, and neglect of duty. The accuſation was ſupported by venal orators in the pay of Chares.

Timotheus and Iphicrates were tried capitally. The former truſted to his innocence and eloquence; the latter to an expedient which had diſgracefully ſucceeded before. The targeteers, or light infantry, who had been long diſciplined and commanded by Iphicrates, ſurrounded, on the day of trial, the benches of the magiſtrates; and ſeaſonably diſplayed the points of their daggers. The magiſtrates, overawed by the inſtant danger which they had neither ſtrength to reſiſt nor virtue to elude, were compelled to an immediate deciſion; but, inſtead of the ſentence of death, they impoſed a fine on the delinquents, which no Athenian citizen in that age was in a condition to pay. This ſeverity drove into baniſhment thoſe two illuſtrious commanders. Timotheus ſailed to Chalcis in Eubœa, and afterwards to the iſle of Leſbos, both which places his valour and abilities had recovered for the republic, and which, being choſen as his reſidence in adverſity, ſufficiently evince the mildneſs of his government, and his moderation in proſperity. Iphicrates travelled into Thrace, where he lived and died in obſcurity. Thus did the ſocial war deſtroy or remove Iphicrates, Chabrias, and Timotheus, the beſt generals whom Greece could boaſt; and, the brave and honeſt Phocion excepted, the laſt venerable remains of Athenian ability and virtue.

By the removal of thoſe diſtinguiſhed commanders, Chares was left to conduct, uncontrouled, the war againſt the allies; and to diſplay the full extent of his weakneſs and incapacity. His inſatiable avarice rendered him intolerable to the friends of Athens; his voluptuouſneſs and negligence expoſed him to the contempt of the inſurgents. He indulged his officers and himſelf in a total neglect of diſcipline; the reduction of the rebels was the leaſt matter of his concern; he was attended by an effeminate crowd of dancers and harlots, whoſe extravagance exhauſted the ſcanty ſupplies raiſed by the Athenians for the ſervice of the war. In order to ſatisfy the clamorous demands of the ſoldiers, Chares, regardleſs of the treaties ſubſiſting between Athens and Perſia, let out himſelf and his forces to Artabazus, the wealthy ſatrap of Ionia, who had revolted from Artaxerxes Ochus, the moſt cruel tyrant that ever diſgraced the throne of Cyrus. The arms of the Greeks ſaved Artabazus from his implacable reſentment, and their ſervices were laviſhly rewarded by the gratitude of the ſatrap. But this ſingular tranſaction neither aſtoniſhed nor diſpleaſed the Athenians. They were now accuſtomed to allow their commanders in foreign parts to act without controul; and the creatures of Chares extolled his good management in paying the Grecian troops with Perſian money. But the diſgraceful triumph was of ſhort duration. Ochus ſent an embaſſy to remonſtrate with the Athenians on their unprovoked infraction of the peace; and threatened, that unleſs they immediately withdrew their forces from Aſia, he would aſſiſt the rebels with a fleet of three hundred ſail. This menace, in the year before Chriſt 356, obliged

the

the Athenians to recal their armament from the eaſt, and to terminate the laſt ſocial war, without obtaining any of the purpoſes for which it had been undertaken. The confederates made good the claims which their ſufferings had urged; regained complete freedom and independence; and lived twenty years exempt from ſubſidies and contingents, till they ſubmitted, with the reſt of Greece, to the ſuperior fortune and intrigues of Philip, who paved the way to the irreſiſtible ſucceſs of the Macedonian arms.

From the TERMINATION of the THIRD SOCIAL WAR, to the ASSASSINATION of PHILIP KING of MACEDON.

The peopling of Macedonia, as far back as the year before Chriſt 814, is attributed to Caranus, an Argive prince of the race of Hercules, who, eluding the dangers which proved fatal to royalty in moſt communities of Greece, conducted a ſmall colony of his adventurous countrymen, and, having conquered the warlike natives, ſettled in Edeſſa, the capital of the province then named Emathia. According to ancient mythology, the gods took care of the infancy of Macedon, and ſent, as oracles had announced, a herd of goats to conduct Caranus to his new capital of Edeſſa, which thence changed its name to Ægæ, the city of goats; a fiction unworthy of record, did it not explain the reaſon why goats were adopted as the enſigns of Macedon, and why the figures of thoſe animals are ſtill to be ſeen on the coins of Philip and his ſucceſſors. Caranus, and the princes Cœnus and Thyrimas, who immediately followed him, had occaſion to exerciſe their prudence as well as their valour. Their feeble colony of Greeks might have fallen a prey to the ferocity of the aboriginal tribes, had they not endeavoured to gain, by good offices, the ancient inhabitants of Emathia, and the neighbouring diſtricts. By this judicious ſyſtem, the followers of Caranus gradually aſſociated with the warlike tribes in their neighbourhood, whom it would have been alike impoſſible to extirpate, or to enſlave; and this generous policy, being embraced by their deſcendants, may be regarded as the primary cauſe of Macedonian greatneſs.

Perdiccas, the firſt of that name, ſo far eclipſed the fame of his three predeceſſors, that he is accounted the founder of the monarchy by Herodotus and Thucydides. Five princes are ſaid to have intervened between him and Alexander I. who filled the Macedonian throne when Xerxes invaded Greece. Alexander acted an important part in the affairs of Greece and Perſia, without neglecting the intereſt of his own kingdom, which he extended to the river Neſſus on the eaſt, and to the Axius on the weſt. His ſon, Perdiccas II. inherited the abilities of his father; and was ſucceeded by his ſon Archelaus I. who diſplayed an enlightened policy, encouraged agriculture and the arts; and was the friend of men of merit and genius, in all the various walks of literature and ſcience. A reign of ſix years was too ſhort a period for accompliſhing the important improvements which Archelaus had in view. By his death, in the year before Chriſt 405, the proſperity of Macedon was interrupted for almoſt half a century, by a ſucceſſion of ten princes or uſurpers, whoſe hiſtory forms a perpetual ſeries of crimes and calamities. The ſceptre, however, finally remained in the family of Hercules; but almoſt every prince of the blood had an ambition to reign, whereby aſſaſſination and ſedition alternately ſucceeded each other. Bardyllis, an active and daring chief, who had riſen from the condition of a private robber to the command of the Illyrian tribes, entered Macedon at the head of a numerous army, diſpoſſeſſed Amyntas II. the father of the illuſtrious Philip, and placed Argæus on the throne, who conſented to become the tributary of his benefactor. The Thracians ſupported the title of another prince named Pauſanias; but the aſſiſtance of Theſſaly and Olynthus, in the year before Chriſt 383, enabled Amyntas to reſume the government; the Olynthians refuſing, however, to ſurrender ſeveral places of importance which Amyntas had entruſted to their protection, he complained to Sparta; and that republic, as we have ſeen above, declared war againſt Olynthus, and reinſtated the Macedonian king in full poſſeſſion of his dominions.

The ſhort reign of his ſon Alexander was diſturbed by an invaſion of the Illyrians, from whom he purchaſed a precarious peace. He left two brothers, Perdiccas and Philip; both of whom being minors, Pauſanias found means to uſurp the throne, in which he was ſupported not only by the Thracians, but by a conſiderable body of Greek mercenaries, as well as by a powerful party in Macedon. At length, Iphicrates the Athenian eſtabliſhed Perdiccas on the throne; but as he was ſtill in his minority, the kingdom was governed by his natural brother Ptolemy, who in his turn openly aſpired to the crown. This uſurper was dethroned by Pelopidas and the Thebans, who again reinſtated Perdiccas in his dominions; and, in order to ſecure the dependence of Macedon on Thebes, carried into that city as hoſtages thirty Macedonian youths, and with them Philip, the younger brother of the king. Perdiccas now, elated with the protection of the Thebans, forgot the gratitude he owed to Iphicrates and the Athenians; diſputed the right of that people to Amphipolis, which had been acknowledged by the general council of Greece; and his unſeaſonable oppoſition rendered fruitleſs their endeavours to recover that important eſtabliſhment. The Athenians found an avenger in Bardyllis, to whom Perdiccas had denied the tribute that had been paid by his predeceſſors Argæus and Alexander. Bardyllis therefore maintained his claim by force of arms. The Macedonians met him in the field, and were totally defeated; Perdiccas was taken priſoner, and ſoon after died of his wounds; leaving as his ſucceſſor Amyntas, an infant ſon. The Thracians now again ſupported the cauſe of Pauſanias, whom they prepared to ſend back into Macedon at the head of a numerous army; but Argæus, the ancient competitor of king Amyntas for the throne of Macedon, renewed his pretenſions to that dignity; and eaſily perſuaded the Athenians, by the hopes of recovering Amphipolis, to exert themſelves in his favour. Impelled by this object, the Athenians launched their fleet, and ſailed towards the coaſt of Macedon, with three thouſand heavy-armed men, commanded by Mantias.

Such were the evils which oppreſſed Macedon, when the young and heroic Philip appeared, in the year before Chriſt 360, aſſerting the rights of his infant nephew againſt two candidates for the throne, and four formidable armies. The Athenian fleet had already anchored before the harbour of Methonè; Argæus, with his numerous followers, had encamped in the province of Pieria; and their united forces prepared to march northward to Edeſſa, or Ægæ, the ancient capital of Macedonia, where they expected to be joined by a powerful party, whom fear or inclination would bring to the ſtandard of the baniſhed king. The Macedonians who adhered to the intereſt of Perdiccas, or rather of his infant ſon Amyntas, were rouſed and animated by the manly exhortations of Philip. His graceful perſon, inſinuating addreſs, and winning affability, at once gained the unlimited confidence of the Macedonians, who now unanimouſly agreed to ſet aſide the ſucceſſion of Amyntas; and Philip, who had hitherto poſſeſſed only the power of regent, was inveſted with the royal title and authority. After this elevation to the ſupreme dignity, Philip had no ſooner collected ſufficient ſtrength to take the field, than he directed his whole force againſt Argæus, and defeated him in a general engagement, in which Argæus himſelf fell, with the flower of his army. The young king, having given ſuch early proofs of his abilities in negociation and war, availed himſelf of

the affection of his ſubjects to eſtabliſh, during a ſeaſon of tranquillity, a new and invincible order of warriors. From the braveſt of the Macedonian youth, he choſe a ſelect body, which he diſtinguiſhed by the name of COMPANIONS, who, being entertained at the royal table, attended the king's perſon in war and in hunting. Their intimacy with the ſovereign, which was regarded as a proof of their merit, obliged them to ſuperior diligence in all the ſevere duties of a military life. The noble youth, animated with the hope of glory, vied with each other to gain admiſſion into this diſtinguiſhed order; and while, on one hand, they ſerved as hoſtages for the allegiance of their families, they formed, on the other, an uſeful ſeminary of future generals, who, after conquering for Philip and Alexander, at length conquered for themſelves, and divided the ſpoils of the ancient world.

The military reſources which the activity of Philip had provided, his ambition did not allow to remain long unemployed. The death of Agis, king of the Pæonians, drew him into the field, to revenge the injuries which thoſe barbarians had inflicted on Macedon. Deprived of the valour of Agis, the Pæonians loſt all hopes of defence. Philip over-ran their country, impoſed a tribute on their chiefs; and reduced Pæonia to an abſolute dependence on Macedon. His arms were next directed againſt Olynthus, and other cities of the Chalcidicè, which alſo ſoon acknowledged him for their ſovereign. But the importance of Olynthus and Chalcidicè could not divert the ſagacity of Philip from Amphipolis, which he regarded as a more neceſſary, though leſs ſplendid, conqueſt. The poſſeſſion of Amphipolis, which would connect Macedon with the ſea, and ſecure to that kingdom many commercial advantages, opened a road to the woods and mines of mount Pangæus, the former of which was ſo eſſential to the raiſing of a naval power, and the latter to the forming and keeping on-foot a ſufficient military force. Philip penetrated eaſtward thirty miles beyond Amphipolis, to the town of Crenidæ, ſituated at the foot of mount Pangæus, diſtant ten miles from the ſea. Here his attention was attracted by the gold-mines in that neighbourhood, formerly wrought by colonies from Thaſos and from Athens, but totally neglected ſince the ignorant Thracians had become maſters of Crenidæ. Philip expelled thoſe barbarians, and a Macedonian colony was planted at Crenidæ, which thenceforth aſſumed the name of Philippi.

Having effected the main purpoſe of his Thracian expedition, Philip immediately contracted an alliance with Arybbas king of Epirus, a principality which ſkirted the weſtern frontier of Theſſaly. In his excurſions from Thebes, he had early ſeen Olympias, the ſiſter of that prince, whoſe wit and ſpirit, joined to the lively graces of her perſon, had made a deep impreſſion on his heart. Their interview naturally revived his tender paſſions; and, as the kings of Epirus were lineally deſcended from Achilles, the match appeared every way ſuitable; Arybbas yielded his conſent, and the beautiful princeſs, in the year before Chriſt 357, was conducted into Macedon.

Meanwhile the tributary princes of Pæonia and Illyria prepared to rebel; the king of Thrace engaged in their deſigns, which were concerted with more caution than is uſual with barbarians; and this general conſpiracy of neighbouring ſtates might have repreſſed for a while the fortune of Macedon, if Philip had not been ſeaſonably informed of the danger by his emiſſaries in thoſe countries. Early in the enſuing ſpring he took the field with the flower of the Macedonian troops. Parmenio, the general in whom he had moſt confidence, cruſhed the rebellion in Illyria, while Philip was equally ſucceſsful in Pæonia and Thrace. He was informed of the victory of Parmenio, juſt as a ſecond meſſenger acquainted him that his horſes had gained the prize in the chariot-races at the Olympic games; a victory which he regarded as far more honourable, and which, as it proved him a legitimate ſon of Greece, he carefully commemorated by impreſſing a chariot on his coins. Almoſt at the ſame time, a third meſſenger arrived with the joyful tidings that Olympias had brought forth a prince at Pella; to whom, as born amidſt ſuch auſpicious circumſtances, the diviners announced the greateſt proſperity and glory. Such a rapid tide of good fortune did not overſet the prudence of Philip, if we may judge by the firſt authentic tranſaction which immediately followed thoſe events. This was the correſpondence with Ariſtotle the philoſopher, written with a brevity which marks the king and the man of genius. "Know that a ſon is born to us. We thank the gods, not ſo much for their gift, as for beſtowing it at a time when Ariſtotle lives. We aſſure ourſelves that you will form him a prince worthy of his father, and worthy of Macedon." Ariſtotle commenced this illuſtrious employment about thirteen years afterwards, when the expanding mind of Alexander might be ſuppoſed capable of receiving the benefit of his inſtructions.

Philip had reigned about five years, when it became the moſt arduous purpoſe of his ambition to obtain the ſovereignty of Greece. But inſtead of diſcovering theſe deſigns, he concealed his deep-laid policy with a careful aſſiduity. He was ſenſible, that by ſnatching too eagerly at the prize, he might deſtroy for ever his proſpect of obtaining it. While the Athenians were occupied by the deſtructive war with their confederates, he had, indeed, embraced the opportunity to gain poſſeſſion of ſeveral of their dependent ſettlements in Thrace and Macedon; colouring, however, theſe proceedings by the pretence of juſtice or neceſſity, and tempering even his hoſtilities by many liberal acts of kindneſs and generoſity. Succeſſive events alſo correſponded with his views. The Amphictyons, having recovered their authority, began to exerciſe an uncontrouled power over the petty ſtates of Greece. They pretended that many unwarrantable abuſes had been introduced, which it became them to remedy. The rights of religion, they ſaid, which it was their firſt duty to maintain, had been materially violated by the Phocians, who had ploughed lands conſecrated to Apollo, and conſequently withdrawn from agriculture. They therefore fulminated an angry decree againſt Phocis, commanding the ſacred lands to be laid waſte, and impoſing a heavy fine on that community.

The Phocians, thus ſingled out as the victims of oppreſſion, were deeply agitated by their danger. The commands of the Amphictyons were indeed peremptory; but that council had not on-foot any ſufficient force to render them effectual, ſhould the objects of their vengeance venture to oppoſe their authority. This meaſure, daring as it ſeemed, was ſtrongly recommended by Philomelus, whoſe eloquence and valour gave him a powerful aſcendant in Phocis. He poſſeſſed great hereditary wealth; contemned the national ſuperſtition; and being endowed with an ambitious ſpirit, he expected to riſe, amidſt the tumult of war, to an unrivalled preeminence in the republic. After repeated deliberations, in which he flattered the vanity and tempted the avarice of his countrymen, he brought the majority of the ſenate into his opinion. As the propereſt inſtrument to execute his own meaſures, Philomelus was named general: the Phocian youth flocked to his ſtandard; and his private fortune, as well as the public revenues, were conſumed in purchaſing the mercenary troops which abounded in every province of Greece. Thus reinforced, Philomelus, in the year before Chriſt 356, ventured on a meaſure not leſs ſingular than unexpected. The temple of Delphi, ſo long guarded by ſuperſtition, was not defended by any military force. Philomelus, having prepared the imagination of his followers for this bold enterpriſe, immediately conducted them towards Delphi, and entered the ſacred city in the ſtyle

of a conqueror. The Delphians, who expected no mercy from a man devoid of respect for religion, prepared themselves in silent horror for beholding the complicated guilt of sacrilege and murder. But Philomelus declared that he had come to Delphi with no hostile disposition against the inhabitants, with no sacrilegious designs against the temple. His principal motive was to emancipate the one and the other from the arbitrary controul of the Amphictyons, and to assert the ancient and unalienable prerogative of Phocis to be the patron and protector of the Delphian shrine. To the same purpose he scattered declarations through the different republics of Greece; his emissaries acquainted the Spartans that he had destroyed the brazen tablets containing the unjust decrees against Sparta and Phocis; they inflamed the resentment of the Athenians, naturally hostile to Thebes; and both those republics came to the resolution of supporting the measures of Philomelus.

The Thebans, on the other hand, who directed, and the Locrians, Thessalians, and other states, who obeyed, the decrees of the Amphictyons, determined to take the field in defence of their insulted religion. Their operations were conducted with that extreme slowness natural to confederacies. Philomelus acted with more vigour. He collected above ten thousand mercenaries, who sacrificed all scruples of religion to the hopes of dividing a rich spoil. He first proceeded to fortify the temple and city of Delphi, in which he placed a strong garrison; and, with the remainder of his forces, boldly marched forth to repel the incursions of the enemy. During two years, hostilities were carried on with various fortune against the Locrians and Thebans. Victory for the most part inclined to the Phocians; but there happened not any decisive action, nor was the war memorable on any other account but that of the excessive cruelty mutually inflicted and suffered. The Phocian prisoners were uniformly condemned to death, as wretches convicted of the most abominable sacrilege; and the resentment of their countrymen retaliated with equal severity on the unhappy captives whom the chance of war threw into their hands. As both armies expected reinforcements, they were unwilling to risk a general engagement. Entangled, however, among the woods and mountains of Phocis, the conveniency of forage attracted both towards the same point. The vanguards met unexpectedly near the town of Neone, and began to skirmish. A general and fierce action followed, in which the Phocians were repelled by superior numbers. Pathless woods, abrupt rocks and precipices, obstructed their retreat. In vain Philomelus strove with his voice and arm to rally the fugitives. He himself was carried along to the brink of a precipice, afflicted with wounds, and still more with anguish and despair. The enemy advanced upon him; it seemed impossible to escape their vengeance; the resolution of Philomelus was prompt and terrible; with a vigorous bound he sprang from the rock, thus eluding the torment of his own mind, and the resentment of his pursuers. While the Thebans and their allies admired this spectacle as a manifest indication of divine vengeance, Onomarchus, the lieutenant and brother of the Phocian general, collected and drew off the scattered remains of the vanquished army towards Delphi. The confederates determined to expel them from that sacred place, and to inflict on them a punishment similar to that to which the wrath of Apollo had driven the impious Philomelus.

Different causes had concurred to prevent Philip on the one hand, and Athens and Sparta on the other, from taking an early part in the Phocian war. The interested policy of Archidamus, who directed with absolute authority the councils of Sparta, was less anxious to support the arms of his distant confederates, than solicitous to recover the Lacedæmonian dominion in Peloponnesus. The opportunity seemed favourable for this purpose, the Thebans being deeply engaged in another contest, and the Athenians in strict alliance with Sparta. For several years the arms of Archidamus were employed against the Messenians, Arcadians, and Argives. But his design failed of success; the inferior cities of Peloponnesus, roused by the common danger, confederated for their mutual defence; and Athens, though actually the ally of Sparta, was unwilling to abandon to the tyranny of that republic her more ancient and faithful allies, the Arcadians and Messenians. Yet while the politics of the Peloponnesus formed a system apart, the sacred war shook the centre of Greece, and the affairs of Thrace began to occupy the mind of Philip and the Athenians. Cotys, who long reigned in Thrace, was dead; his sons, Kersobleptes, Berisades, and Amadocus, were all dissatisfied with the partition of his dominions. While their hostilities against each other exhibited a cruel picture of fraternal discord, the prizes for which they contended were successively carried off by Philip. The encroachments of that prince at length engaged Kersobleptes, the most powerful of the co-heirs, to cede the Thracian Chersonesus to the Athenians, who sent Chares with a numerous fleet to take possession of that peninsula. The town of Sestos alone made resistance. It was taken by storm, and treated with great severity by Chares; while Philip besieged and took the far more important city of Methonè in Pieria. In this siege he lost an eye, a loss which he is said to have borne with impatience, as the circumstances attending it were alike dishonourable to his judgment and humanity.

It appears extraordinary that the Thebans, after the defeat and death of Philomelus, should not have pursued their good fortune, without allowing the enemy time to recover strength. They probably imagined that the fatal exit of that daring chief would deter a successor; and that the Phocians would sue for peace, if not driven to despair. Such indeed was the resolution of the more respectable part of the Phocians. But the bold and needy, who composed the most numerous description of that people, were bent on continuing the war. An assembly was convened, when Onomarchus flattered their hopes, and encouraged them to persevere. His opinion prevailed; he was named general; and his conduct soon proved, that he equalled his brother in boldness and ambition, and surpassed him in activity and enterprise. With the Delphic treasure he coined such a quantity of money as perhaps had never before circulated in Greece. The Phocian army was augmented; their allies were more heartily encouraged; and even their enemies were not proof against the temptations of gold. By seasonable bribes, Onomarchus distracted the councils of Thebes, and kept their arms inactive. The neighbouring states were persuaded to observe a perfect neutrality; while the Thessalians, a people at all times noted for avarice and fraud, and of whose country the proverb said, "that it had never produced a bad horse or an honest man," openly embraced the cause of Phocis. These multiplied advantages were not suffered to languish in the hands of Onomarchus: at the head of a numerous army he poured down on Locris and Doris, ravaged the country, took Thronium by storm, laid several cities under contribution, pierced into Bœotia, and made himself master of Orchomenus. The Thebans assembled their forces to stem the torrent. Onomarchus first met with a repulse before the walls of Chæronæa, and ventured not to renew the engagement, having weakened his forces by leaving garrisons in the places which he had taken, as well as by sending a detachment of seven thousand men, under his brother Phayllus, into Thessaly.

In that country, the arms and intrigues of Philip counteracted the gold of Onomarchus: with his usual diligence he entered Thessaly, defeated Phayllus, besieged and took Pegasæ, and drove the enemy towards the

the frontier of Phocis. The fear of loſing his newly-acquired intereſt among the Theſſalians, made Onomarchus evacuate Bœotia, and advance againſt Philip. The Macedonians, though leſs numerous, did not decline the engagement. At the firſt charge the Phocians gave way, and retreated towards the neighbouring mountains. Philip ordered his men to purſue in their ranks. It was then that the Phocians really began the battle. Onomarchus foreſeeing that the Macedonians would follow in cloſe order, had poſted a detachment on the ſummit of the precipice, who were ready, on a given ſignal, to roll down fragments of rock, and ſtones of an enormous ſize, on the embattled phalanx. This was the only mode of attack for which the Macedonians were not prepared. The line of march, in which the moment before they proceeded with ſuch firmneſs and confidence, was converted into a dreadful ſcene of carnage and ruin. Before they recovered from their conſternation, the flying Phocians, who had decoyed them into this ambuſh, returned to the charge. Philip, however, rallied his men; and while Onomarchus heſitated to advance, he drew them off in good order, with a view to ſtrike with more impetuous vigour in the next rencounter. This was finally juſtified; although the Phocians firſt enjoyed a ſhort triumph. Philip having recruited his army, returned into Theſſaly; and a conſiderable portion of the Theſſalians received the king of Macedon as their deliverer. Onomarchus was thus obliged to withdraw his forces from Bœotia. At the head of twenty thouſand foot and five hundred horſe, he was met by the Macedonians, ſtill more numerous, on the coaſt of Magneſia. To remind his ſoldiers that they fought in the cauſe of Delphi and of Heaven, Philip crowned their heads with the laurel conſecrated to Apollo, and adorned his ſtandards with the attributes of that divinity. Their onſet was impetuous and fierce, and their valour, animated by enthuſiaſm, rendered them irreſiſtible, though the Phocians, conſcious of guilt, fought with the fury of deſpair. Three thouſand Theſſalian cavalry, who had ſignally contributed to the victory of Philip, rendered the purſuit bloody and deſtructive; while the Phocians, having thrown away their armour, fled towards the ſea, allured by the ſight of the Athenian fleet under Chares, which was returning from the Cherſoneſus. That commander ſeems not to have made any attempt to ſave them. Above ſix thouſand periſhed in the battle, or in the purſuit. The body of Onomarchus was found among the ſlain; Philip ordered it to be hung on a gibbet, as a mark of peculiar infamy; the reſt were thrown into the ſea, as unworthy, by their impious ſacrilege, of the rites of burial.

It might be expected that ſuch a deciſive blow ſhould have proved fatal to the Phocians. But Philip, who had conquered them in Theſſaly, durſt not purſue his advantages by invading Phocis. It was his intereſt to perpetuate diſſenſions in Greece. For that reaſon he fomented the diſcord that reigned among the ſtates of Peloponneſus; and though he had purſued the obnoxious Phocians, he was unwilling to terminate a war, which diverted the public attention from penetrating his own ambitious deſigns. He had long deluded the Olynthians by good offices and promiſes, but now began to throw off the maſk, and to ſhow that he meant to be their ruler. He actually applied to Kerſobleptes, whom he ſubtilly detached from the intereſt of Athens; and having raiſed him on the ruins of the neighbouring chieftains of Thrace, thereby obtained his confidence, and waited an occaſion to deſtroy him with ſecurity. The dominions of that prince opened the way to Byzantium, his deſigns againſt which were manifeſted by attacking the fortreſs of Heræum, which ſerved as an outwork and defence to that rich and populous city.

The Athenians had ſufficient penetration to diſcern the drift of Philip. They formed an alliance with the republic of Olynthus; they warned Kerſobleptes of his danger; they voted a numerous fleet to ſail to the defence of Byzantium, with which, though rendered independent of Athens by the ſocial war, they ſtill carried on a lucrative commerce. But theſe ſpirited exertions were not of long continuance. Philip's wound at Methonè, together with the continual labour and fatigue to which he had afterwards ſubmitted, threw him into a dangerous malady. The report of his ſickneſs was, before it reached Athens, magnified into his death. The Athenians rejoiced in ſo ſeaſonable a deliverance, and, laying aſide their naval preparations, bent their principal attention to the ſacred war. That unhappy conteſt was renewed by Phayllus, the laſt ſurviving brother of Philomelus and Onomarchus. As his cauſe became more deſperate, Phayllus availed himſelf to the utmoſt of the only reſource which was left him. Having converted into ready money the moſt precious dedications of Delphi, he doubled the pay of his mercenaries. This extraordinary encouragement brought new adventurers to his ſtandard, and ſoon rendered his army equal to that of either of his predeceſſors. The fugitive Theſſalians, aſſembled by their general Lycophron, entered into his pay. By means of the Delphic treaſure, he acquired, likewiſe, the aſſiſtance of a thouſand Lacedæmonians, two thouſand Achæans, five thouſand Athenian foot, with four hundred cavalry. Theſe powerful reinforcements, in the year before Chriſt 352, enabled the Phocians again to become moſt formidable to their enemies.

Philip, meanwhile, recovered from his indiſpoſition. The preparations of the Athenians had taught him that his deſigns could no longer be concealed. The occaſion required that he ſhould appear in favour of his allies, and in defence of the pious cauſe which he had formerly maintained with ſo much glory. While his enemies admired his piety and trembled at his valour; they would now view with religious awe his unexpected appearance at Thermopylæ, to aſſert the violated rights of the Delphian temple. Such were the hopes and motives on which Philip, at the head of a numerous army, directed his march towards thoſe celebrated ſtraits, which had been immortalized by the fame of Leonidas. But the event ſhewed, that on this occaſion he had made a falſe eſtimate of the valour and ſuperſtition of the Athenians. That people penetrated his deſigns, and determined to oppoſe them. With an alacrity and ardour, of which there was no recent example in their councils, they flew to arms, launched their fleet, ſailed to Thermopylæ, and firſt took poſſeſſion of the ſtraits. Never did Philip meet with a more ſenſible diſappointment, than in being anticipated by a people whom he had ſo often deceived. He retired with regret, leaving the Phocian war to be carried on by the Thebans and their allies. Meanwhile, the Athenians placed a guard at Thermopylæ; and, elated by the firſt inſtance of their ſucceſs againſt the Macedonian, called an aſſembly to deliberate on meaſures proper to reſtrain his ambition.

This aſſembly is rendered memorable by the firſt appearance of Demoſthenes againſt Philip, whoſe meaſures from this moment he ceaſed not to watch and to counteract. The Athenians were then involved in the ſacred war; their northern poſſeſſions were continually inſulted by Philip; yet in this ſituation of affairs, the partiſans of that prince, in order to divert the public attention from his too aſpiring deſigns, affected to extend their views to Aſia, and to be alarmed by the motions of Artaxerxes Ochus, who was preparing to reduce the rebels of Cyprus, Egypt, and Phœnicia. In every aſſembly of the people, the creatures of Philip, dwelt, with exaggerated terror, on the naval and military preparations of the great king, which they repreſented as deſtined to revenge the injuries committed by the Athenian troops, under Chares, on the coaſt of Aſia. In this popular argument joined Iſocrates the orator,

together with the ſtateſman and general Phocion, two men whoſe talents and virtues would have done honour to the moſt illuſtrious age of the republic. The unblemiſhed integrity of Iſocrates, the diſintereſted poverty of Phocion, afford ſufficient proof that neither of theſe great men were corrupted by Macedonian gold. But they both perceived that the indolence and unſteadineſs of the Athenians were incapable to contend with the unceaſing activity of Philip, and both exhorted their countrymen to cultivate the friendſhip of a prince, againſt whom they could not make war with any reaſonable proſpect of ſucceſs. Iſocrates inſiſted that a foreign war alone could heal the domeſtic diſſenſions which reigned in every quarter of Greece; and from a thorough knowledge of the inherent defects in the government of Thebes, Athens, and Sparta, he regarded Macedon as the ſtate, and Philip as the general, beſt entitled, and beſt qualified, to aſſume the command of a military expedition into Aſia, to deliver the Grecian colonies from the oppreſſion of barbarians. The ſentiments of Demoſthenes were equally different from thoſe of Iſocrates and Phocion on the one hand, and from thoſe of the hirelings of Philip on the other. In the ardour of patriotiſm he forgot the moderation of philoſophy; and while he ſternly maintained the prerogatives of his country, he would rather have ſeen Athens defeated at the head of her allies, than victorious under the ſtandard of the Macedonians, or any ſtandard but her own. With ſuch ſentiments, he was naturally a favourite of the people, and a warm partiſan of popular government; while Phocion preferred a moderate ariſtocracy; and Iſocrates was inclined to a well-regulated monarchy, as the beſt of all governments. Yet ſubſequent events juſtified the opinion of Demoſthenes. The Athenians were delivered from their ill-grounded fears of Artaxerxes Ochus, when they beheld the preparations of that monarch directed againſt his rebellious ſubjects. The encroachments of Philip became continually more formidable; and his recent attempts to ſeize the ſtraits of Thermopylæ, ſhewed the neceſſity of oppoſing him with vigilance and vigour.

The people of Athens were thus divided in ſentiment, and ſplit in party politics, when Philip in the year before Chriſt 349, began to play thoſe batteries which he had raiſed with ſuch ſkill and ſecrecy. The iſland of Eubœa, which he called the fetters of Greece, was the firſt object of his attack. After the Thebans had been conquered, the Athenians preſerved their intereſt in the iſland, where they maintained a ſmall body of troops. The different cities, however, enjoyed the independent government of their own laws; they appointed their own magiſtrates; they ſometimes made war againſt each other; and ſeparately aſſumed the prerogatives of free and ſovereign ſtates, while they all collectively acknowledged their dependence on Athens.

Such political arrangements made room for the intrigues of Philip. He fomented their civil diſcord; gained partiſans in each city; and at length, under colour of protecting his allies, landed an army in the iſland. The Athenian party exclaimed and threatened; but Plutarch, the leader of that party, was gained to the intereſts of Philip, and demanded auxiliaries from Athens only to betray them into the hands of their enemies. Demoſthenes, who alone penetrated this dark ſcheme, entreated and conjured his countrymen to put no confidence in Plutarch. The Athenians at length became more wiſe in the choice of a general. The conſummate prudence of Phocion, who, on his arrival in Eubœa, found things in a worſe ſtate than had been repreſented, riſked no chance of defeat, and loſt no opportunity of advantage. Having choſen a favourable poſt, ſurrounded on all ſides by broken ground, he deſpiſed the clamours of his men and the inſults of the enemy. The treacherous Plutarch was quickly defeated in a mock battle in which he fell back on the Athenian cavalry, who fled in diſorder to the camp of Phocion. The Eubœans and Macedonians purſued with a raſh and intemperate ardour; and, elated with victory, prepared to aſſail the camp, in which they were embarraſſed by the unequal ground, and by their own raſhneſs. Phocion then ſallying from his entrenchments with intrepid valour, increaſed the confuſion of the enemy, who were repelled with great ſlaughter towards the plain which they had at firſt occupied. The activity of Cleophanes, who commanded the Athenian cavalry, rendered the victory complete. The remains of the vanquiſhed took refuge in the fortreſs of Zeratra, in the northern corner of the iſland, which, being attacked, made a feeble reſiſtance. The garriſon ſurrendered; but Phocion reſtored all the Eubœans to liberty, and returned to Athens in triumph.

Philip's diſappointment in Eubœa ſerved only to ſtimulate his activity. The Olynthians, againſt whom he now turned his arms, were aſtoniſhed to obſerve that ſeveral of their citizens grew inſtantaneouſly rich and great, and diſplayed a degree of magnificence and grandeur hitherto unknown in their frugal republic. The unexpected invaſion of Philip revealed the myſtery; and diſcovered that a conſiderable party had grown wealthy by betraying the ſecrets of their country. In this emergency they truſted not to their domeſtic forces of ten thouſand foot and one thouſand horſe, but ſent an embaſſy to Athens, craving their aſſiſtance againſt ſo inſidious and formidable an enemy. Had the people of Athens heartily undertaken their cauſe, Philip would have been expoſed to every difficulty. But the Athenians were plunged into a ſlothful and fatal ſecurity. While they enjoyed their theatrical entertainments, and all the eaſe and luxury of a city life, they were little inclined to engage in any enterpriſe that might diſturb the tranquil courſe of their pleaſures. In this diſpoſition they were encouraged by many of their orators, who exhorted them to beware of involving themſelves in the danger of Olynthus, or of provoking the reſentment of a prince whoſe power they were unable to reſiſt. The orator Demades particularly diſtinguiſhed his zeal in the Macedonian intereſt; adviſing an abſolute and total rejection of the demands of the Olynthian ambaſſadors. But Demoſthenes aroſe, and with all the fire and enthuſiaſm of genuine rhetoric, expatiated on the extent of their ſupineneſs and folly.

"On many occaſions, O Athenians! have the gods declared their favour to this ſtate, but never more manifeſtly than in the preſent juncture. That enemies ſhould be raiſed to Philip, on the confines of his territory, can be aſcribed to nothing leſs than the bountiful interpoſition of Heaven. With every thing elſe on our ſide, let us not be wanting to ourſelves; let us not be reproached with the unſpeakable infamy of throwing away, not only thoſe cities and territories which we inherited from our anceſtors, but thoſe occaſions and alliances offered us by fortune and the gods. To inſiſt on the power and greatneſs of Philip, were to bewilder and miſlead you in open violation of your own ſenſes. He has become great through your ſupine neglect, and the perfidy of traitors whom it becomes you to puniſh. I am of opinion then, that, fearleſs of conſequences, you ought to aſſiſt Olynthus with the utmoſt celerity and vigour, and to diſpatch an embaſſy to the Theſſalians, to inflame their hoſtility. But take care, Athenians! that your ardour evaporate not into reſolutions and decrees. Be ready to pay your contributions; prepare to take the field; ſhow yourſelves in earneſt, and you will ſoon diſcover not only the hollow faith of the allies of Philip, but the internal weakneſs of Macedon itſelf."

The people of Athens, animated to their duty, on the one hand, by Demoſthenes, and ſeduced, on the other, by the hirelings of Philip, imprudently ſteered a middle courſe, which is often the moſt dangerous. Convinced that

that the preſervation of Olynthus was the beſt ſafeguard of Attica, yet unwilling to tear themſelves from their pleaſures, they determined to ſend Chares, with a fleet and two thouſand mercenaries, to the aſſiſtance of their allies. This commander, who was the idol of the diſſipated multitude, made a deſcent on the fertile coaſt of Pallenè, where, falling in with eight hundred men commanded by Audæus, called the friends of Philip, he obtained over thoſe contemptible cowards an eaſy and ludicrous victory, which ſerved only to amuſe the comic poets of the times. Having gained this paltry advantage, Chares was unwilling to try his fortune in any ſeverer conflict; but returned home, to celebrate his triumph over the vain and voluptuous Audæus. The thoughtleſs multitude, who judged of the expedition of Chares by the pomp with which he entertained them at his return, now talked of invading Macedon, and chaſtiſing the inſolence of Philip, when a ſecond embaſſy arrived from Olynthus. The inhabitants of this place had been ſhut up within their walls; they had loſt Stagyra, Miciberna, Toronè, cities of great ſtrength; yet on the firſt appearance of Philip, they were forward to receive his bribes, and open their gates; which ſhameful venality, in places ſo well provided for defence, made the king of Macedon obſerve to his generals, "that from thenceforth he ſhould conſider no fortreſs or gate impregnable, which would admit only a ſingle mule a-breaſt, laden with money." The Olynthians, in the mean time, turned their thoughts to negociation, that they might amuſe the invader till the arrival of the Athenian ſuccours. Philip penetrated their deſign, and dexterouſly turned their arts againſt themſelves; affecting to lend an ear to their propoſals, but meanwhile continuing his approaches, till, having got within forty ſtadia of their walls, he declared that of two things one was neceſſary, either *they* muſt leave Olynthus, or *he* Macedon. This explicit declaration convinced the Olynthians that their ruin was at hand. They endeavoured to retard the fatal moment by a vigorous ſally, in which their cavalry, commanded by Apollonides, particularly ſignaliſed their valour. But they were repulſed by ſuperior numbers, and obliged to take refuge in the city.

In this poſture of affairs the Olynthian ambaſſadors ſailed for Athens; and found, to their utter aſtoniſhment, the multitude ſtill enjoying the imaginary triumph of Chares. Demoſthenes, therefore, again undertook the cauſe of Olynthus. After endeavouring to repreſs the vain confidence of his countrymen in the ſuppoſed advantages of Chares, he deſcribed the real danger of their allies, which he perſuaded them to regard as their own. The criſis was now arrived; and if they neglected the preſent opportunity of fulfilling their engagements to Olynthus, they muſt ſoon expect to meet Philip in Attica. After inſiſting ſtill farther on the neceſſity of an immediate and imperious interpoſition, Demoſthenes ſaid, "I ſpeak thus, not with a view to give offence, but becauſe I think it the duty of a public ſpeaker to prefer your intereſt to your pleaſure. Such were the maxims of thoſe ancient and illuſtrious orators whom all unite to praiſe, but none venture to imitate; of the virtuous Ariſtides, of Nicias, of Pericles, and of him whoſe name I bear. But ſince miniſters have appeared who dare not addreſs the aſſembly, till they have firſt *conſulted* you about the *counſels* which they ought to give, who aſk, as it were, What ſhall I propoſe? What ſhall I adviſe? In what, Athenians! can I do you pleaſure? the ſweet draught of flattery has concealed a deadly poiſon; our ſtrength is enervated, our glory tarniſhed, the public name is diſgraced, while ſmooth-tongued magiſtrates and miniſters acquire credit and ſplendour; paſs from poverty and meanneſs to opulence and dignity; build private palaces, which inſult the edifices of the public; grow greater as their country becomes leſs, and gradually riſe on its ruins. What is the ſource of this general diſorder? It is, Athenians! that formerly the people did their duty, took the field in perſon, and thus kept magiſtrates and miniſters in awe."

The arguments of Demoſthenes prevailed; and in the year before Chriſt 348, an embaſſy under the conduct of Æſchines was ſent into Peloponneſus, to inflame the hoſtility of that country againſt Philip; and it was determined to aſſiſt the Olynthians with an army of Athenian citizens. But, before this reſolution could be carried into effect, Olynthus was no more. Its defence had long depended on the merit of one man. In the various ſkirmiſhes, as well as in the two general engagements which had happened ſince the commencement of the ſiege, Philip perceived that Apollonides, who commanded the Olynthian cavalry, diſplayed ſuch valour and abilities as might long retard the ſucceſs of his arms. His ſecret emiſſaries were ſet to work; perfidious clamours were ſown among the populace of Olynthus; Apollonides was publicly accuſed; and condemned to baniſhment on a ſuſpicion of treaſon. The command of the cavalry devolved on Laſthenes and Euthycrates, two wretches who had ſold their country to Philip. Having obtained ſome previous ſucceſſes, which had been concerted the better to maſk their deſigns, they advanced againſt a Macedonian poſt; carried it at the firſt onſet; purſued the flying garriſon; and betrayed their own troops into an ambuſh prepared by the enemy. Surrounded on all ſides, the Olynthians ſurrendered their arms; and this fatal diſaſter, encouraging the Macedonian partiſans within the walls, ſoon opened the gates of Olynthus. The conqueror entered in triumph, plundered and demoliſhed the city, and dragged the inhabitants into ſervitude. Amid the ſcenes of rejoicing and feſtivity which followed this conqueſt, Philip ſeems not to have forgotten that the next object of his policy was to detach the Athenians from the cauſe of Phocis and Kerſobleptes, who were both their allies. The bad conduct of Chares had left the ſea open to the Macedonians, who in the mean time fitted out a conſiderable naval force. Philip now attacked the Athenians on their favourite element. His fleet ravaged their tributary iſlands of Lemnos and Imbros; ſurpriſed and took a ſquadron of Athenian veſſels ſtationed on the coaſt of Eubœa; and, encouraged by theſe advantages, boldly ſailed to Attica, made a deſcent on the ſhore of Marathon, repelled the Athenian cavalry headed by Deotimus, ravaged the territory, and carried off the Salaminian galley. From thence they proceeded to the iſle of Salamis, and defeated a conſiderable detachment commanded by Charidemus. The illuſtrious trophies of Marathon and Salamis were effaced by the inſults of the Macedonians, whoſe fleet returned home in triumph, adorned with ſpoils, and elevated with military and naval glory.

Such was the ſtate of public affairs when Æſchines returned from his Peloponneſian embaſſy. He had aſſembled the great council of the Arcadians; revealed to them the dangerous views of Philip, which threatened the liberty of Greece; and, notwithſtanding the powerful oppoſition of Hieronymus, and other Macedonian partiſans, he had engaged that people to approve the zeal of Athens, and to reſolve on taking arms in the common cauſe. In relating the ſucceſs of his embaſſy, he inveighed with great ſeverity againſt thoſe mercenary traitors, who had ſold the intereſts of their country to a cruel tyrant. The Greeks had full warning of their danger. The miſerable fate of Olynthus ought ever to be before their eyes. At his return through Peloponneſus, he had beheld a ſight ſufficient to melt the moſt obdurate heart; thirty young Olynthians, of both ſexes, driven like a herd of cattle, as a preſent from Philip to ſome of the unworthy inſtruments of his ambition. The ſuſceptible and ever-varying temper of the multitude was deeply affected by theſe repreſentations of Æſchines; whilſt war and revenge echoed through the aſſembly. Ambaſſadors were diſ-

patched to confirm the hoſtile reſolutions of the Arcadians, and the Athenian youth were aſſembled in the temple of Agraulos to ſwear irreconcilable hatred againſt Philip and the Macedonians. But that conſummate politician thought nothing done while any thing was neglected; and, as he allowed not the ſlighteſt opportunity to paſs unimproved, ſo he often derived important benefits from inconſiderable cauſes.

A wealthy Athenian named Phrynon, had been robbed and confined by ſome Macedonian ſoldiers, who compelled him to purchaſe his liberty at a very conſiderable ranſom. As this violence had been committed during the fifteen days of truce that followed the Olympic games, Phrynon judiciouſly ſuppoſed that the king of Macedon, who had long been ambitious of obtaining a place in the Grecian confederacy, would not abet this act of injuſtice. He therefore requeſted his countrymen, who were about to negociate with Philip for an exchange of priſoners, to join him in commiſſion with Cteſiphon, who had already been named to that embaſſy. Having arrived in Macedon, the ambaſſadors were treated by Philip with the greateſt reſpect; their demands were moſt cordially granted; the king apologiſed to Phrynon for the ignorance or violence of his ſoldiers, which had led them to act ſo unwarrantably; and he lamented, both to Phrynon and Cteſiphon, the hoſtile nature of their miſſion, ſince he had nothing more ſincerely at heart than to cultivate the beſt underſtanding with their republic. At their return to Athens, the repreſentations of theſe ambaſſadors could not be without weight; nor could they fail of being extremely favourable to the king of Macedon. But another incident followed, which was improved with no leſs dexterity. At the ſack of Olynthus, Stratocles and Eucrates, two Athenians of diſtinction, had been ſeized and carried into Macedon; and had not been releaſed with the other priſoners. Their relations were anxious for their ſafety, and therefore applied to the Athenians, that a proper perſon might be ſent to treat for their ranſom. Ariſtodemus was employed in this commiſſion; but Philip, who well knew the hoſtile reſolutions in agitation againſt him at Athens, releaſed the priſoners without ranſom, and diſmiſſed them with the higheſt expreſſions of regard. Moved by gratitude, Stratocles and his friends appeared in the aſſembly, and exerted every nerve in praiſe of the king of Macedon. This artificial generoſity of Philip, blazoned forth in the public aſſembly, fixed the wavering irreſolution of the multitude, and the military preparations were ſuſpended. Even Demoſthenes and Æſchines yielded to the torrent; and imagining that a bad peace was better than a bad war, ſupported a decree of Philocrates for ſending a herald and ambaſſadors back to Philip, to fix the terms of accommodation with which he had ſo long amuſed them.

In the ſhort ſpace of one year, three embaſſies were ſent to Philip; the firſt to propoſe a peace, the ſecond to ratify it, the third to ſee the conditions of it obſerved; and, during that time Kerſobleptes, being ſtripped of his dominions, was reduced into captivity, and Philip having ſeized Thermopylæ, invaded Phocis, and deſtroyed the twenty-two cities of that province in leſs than twenty-two days. The Athenians, therefore, ſaw the neceſſity of immediately ratifying the peace with that prince, who had actually taken the field in Thrace, along the coaſt of which the Athenians ſtill poſſeſſed Serrium, Doriſcus, and ſeveral other tributary cities. Theſe cities were now attacked by Philip, and readily ſubmitted to his arms. Upon intelligence of the latter event, the Athenians diſpatched Euclides to inform the king of Macedon, that the places which he had taken belonged to Athens; to which he coldly replied, that he had not been ſo inſtructed by his ambaſſadors, nor was there any mention of thoſe cities in the treaty recently ſigned, but not yet ratified, between the two powers.

The diſtracted ſituation of Thebes now promiſed a ſpeedy iſſue to the Sacred War, which, for more than two years, had been feebly carried on between the Phocians on one ſide, and the Thebans and Locrians on the other, by ſuch petty incurſions and ravages, as indicated the inveterate rancour of combatants, who ſtill retained the deſire of inflicting devaſtation and death, after they had loſt the power. During the greater part of that time, the Athenians, amuſed by this negociation with Philip, afforded no aſſiſtance to their diſtreſſed allies. The treaſures of Delphi, immenſe as they were, at length began to fail. The Phocians, abandoned and exhauſted on all ſides, reflected with terror and remorſe on their paſt conduct; and, in order to make atonement for their ſacrilegious violations of the temple, inſtituted a judicial enquiry againſt Phaleucus their general, and his accomplices, in plundering the dedications to Apollo. Several were condemned to death; Phaleucus was depoſed; and the Phocians, having performed theſe ſubſtantial acts of juſtice, ſolicited with better hopes the aſſiſtance of Sparta and Athens. But the crafty Archidamus, who had long directed the Spartan councils, conſidered the diſtreſs of the Phocians as a favourable opportunity to urge the claim of his own republic to the ſuperintendence of the Delphic temple; and actually ſent ambaſſadors into Theſſaly, to confer with the king of Macedon on that ſubject. The Athenians paid more attention to the requeſt of their allies, who, as an inducement to excite their activity, offered to put them in poſſeſſion of the towns of Nicæa, Alpenus, and Thronium, which commanded the ſtraits of Thermopylæ. But this ſalutary plan, which might have retarded the fate of Greece, was defeated by Phaleucus, who commanding eight thouſand mercenaries, that acknowledged no authority but that of their general, eſtabliſhed his head-quarters at Nicæa, and deſpiſed the menaces both of Phocis and of Athens.

Mortifying as this diſappointment muſt have been, it was followed by a diſaſter in another quarter ſtill more terrible. The Phocians had fortified the city of Abæ, to defend their northern frontier againſt the depredations of the Locrians. The Thebans, reinforced by ſome auxiliaries of Macedon, marched againſt that place. The Phocians met them in the field; but were defeated with great ſlaughter, and purſued through the ſurrounding territory. A party of above five hundred took refuge in the temple of Abæan Apollo, where they remained for ſeveral days, ſleeping under the porticoes, on beds of dried herbs, ſtraw, and other combuſtible materials. An accidental fire, that began in the night, was communicated to the whole edifice, part of which was conſumed, while the unhappy Phocians were either ſtifled, or burnt to aſhes. The Thebans failed not to repreſent this calamity as a judgment of heaven, againſt the daring impiety of wretches, who had ventured to take refuge in the temple of a god whom their ſacrilege had long offended. They entreated Philip to aſſiſt them in deſtroying the remnant of that guilty race. This was the chief purpoſe of their embaſſy to that prince, whom the Athenians entreated to ſpare the nation, while the Lacedæmonians, regardleſs of the fate of Phocis, thought only of making good their ancient claim to the guardianſhip of the Delphic temple.

Philip treated the deputies of the three republics with apparent frankneſs and cordiality. He aſſured the Thebans, that his arms ſhould be employed to recover for them the towns of Orchomenus, Coronæa, and Tilphoſſeum, which had ſubmitted to the Phocians during their invaſion of Bœotia. The Phocians, he ſaid, had rendered themſelves the objects of divine diſpleaſure; and he was determined that both they and their allies

ſhould

ſhould ſuffer thoſe calamities which their crimes ſo juſtly deſerved. Thus far Philip was ſincere; for, in theſe particulars, the views of Thebes were exactly conformable to his own. But in his mind he agitated other matters, in which the intereſt of Thebes interfered with that of Macedon. To accompliſh thoſe purpoſes, without offending his allies, it was neceſſary to gain the ambaſſadors. Careſſes, flattery, and promiſes, were laviſhed in vain. Money was at length tendered with a profuſe liberality; but the Theban deputies remained uncorrupted, firmly maintaining their patriotiſm and their honour. Philon, the chief of the embaſſy, anſwered for his colleagues: "We are already perſuaded of your friendſhip for us, independent of your preſents. Reſerve your generoſity for our country, on which it will be more profitably beſtowed, ſince your favours conferred on Thebes, will ever excite the gratitude both of that republic and its miniſters."

Demoſthenes extols the dignity of this reply, as becoming rather the ambaſſadors of Athens. But theſe miniſters, though one object of their commiſſion was to ſave the Phocians, whom the Thebans wiſhed to deſtroy, diſcovered neither integrity nor ſpirit. All of them, except Demoſthenes, accepted the preſents of the king of Macedon, who found little difficulty in perſuading men, thus prepoſſeſſed in his favour, that he pitied the Phocians; that he reſpected Athens; that he deteſted the inſolence of Thebes; and that, ſhould he ever proceed to the ſtraits of Thermopylæ, his expedition would be more dangerous to that ſtate than to his enemies. At preſent, however, he obſerved, that he had private reaſons for managing the friendſhip of a people who ſet no bounds to their reſentment. From ſuch motives, he had hitherto declined ratifying the peace with Athens; but this meaſure he would no longer defer. He only entreated, that to ſave appearances with the Thebans, the name of the Phocians might be omitted in the treaty. This arduous work was at length brought to a concluſion; and for the more ſecrecy, tranſacted in a place which Demoſthenes calls a tavern, adjoining to the temple of Pollux, in the neighbourhood of Pheræ. The Athenian ambaſſadors took leave, affecting to be perſuaded of the good intentions of the king of Macedon. The ambaſſadors of Sparta alſo departed, but with far leſs ſatisfaction. They made ſuch a report to Archidamus, as convinced him that his republic had not any advantage to expect from the preponderance of the Macedonian intereſt, and the deſtruction of the Phocians; and that, ſhould the Spartans perſiſt in their claim to the ſuperintendence of the Delphic temple, they muſt aſſert it by force of arms. Archidamus therefore raiſed an army for this purpoſe, and marched towards the ſtraits. But the intrigues of Philip rendered his hoſtility as impotent as his negociations had been fruitleſs. From Theſſaly that prince had already ſent a letter to the Athenians, couched in the moſt artful terms. He expreſſed his profound reſpect for the ſtate, and his high eſteem for its ambaſſadors; declaring that he ſhould omit no opportunity of proving how earneſtly he deſired to promote the proſperity and glory of Athens. Of the conditions of the peace he was careful to make no mention; but after many declarations of his good-will, he entreated them "not to be offended at his detaining their ambaſſadors, of whoſe eloquence and abilities he wiſhed to avail himſelf in ſettling the affairs of Theſſaly."

Soon afterwards theſe ambaſſadors returned home; and having given an account of their negociation to the ſenate of Five Hundred, they next appeared before the popular aſſembly; when a motion was made, and agreed to, for thanking Philip for his equitable and friendly intentions, as well as for ratifying a perpetual peace and alliance between Athens and Macedon. In the ſame decree it was determined that the Phocians ſhould ſubmit to the Amphictyonic council, under pain of incurring the diſpleaſure of the republic. Theſe articles, together with the ſecret motives which produced them, were, by the emiſſaries of Philip, immediately communicated to the Phocian ambaſſadors then reſiding at Athens; who, tranſported with joy at the proſpect of averting the calamities which long threatened their country, loſt no time in tranſmitting the agreeable intelligence to their fellow-citizens. They concluded, with a high degree of probability, that, however Philip might deceive the Phocians, the miniſters of Athens could never be ſo bold as publicly to deceive the Athenians; and that, therefore, they could no longer entertain any doubt of the favourable diſpoſition of the king of Macedon. This belief was ſo firmly eſtabliſhed, that when Archidamus marched into Phocis at the head of an army in order to defend the temple againſt Philip, the Phocians rejected his aſſiſtance, obſerving, that they feared for Sparta much more than for themſelves; upon which the Lacedæmonians returned into Peloponneſus.

Philip was now prepared for ſtriking a deciſive blow. The Athenians were appeaſed; the Lacedæmonians had retired; the Phocians were off their guard; Theſſalians, Thebans, and Locrians, were devoted to his ſtandard. One obſtacle only remained, and that eaſy to be ſurmounted. Phaleucus, who commanded eight thouſand mercenaries, ſtill kept poſſeſſion of Nicæa. But a man who had betrayed the intereſt of his own republic, could not be very delicate in defending the cauſe of Greece. Philip entered into a negociation with him, in order to get poſſeſſion of Nicæa, without which it would have been impoſſible to paſs the ſtraits of Thermopylæ; and, while this tranſaction was going forward, he wrote letters to the Athenians, full of cordiality and affection. He by this means not only kept the Athenians from liſtening to the remonſtrances of Demoſthenes, but prevailed on them to depute that orator, together with Æſchines, and ſeveral others, whoſe advice and aſſiſtance he affected to want, in order to ſettle the arduous buſineſs in which he was engaged. Demoſthenes ſaw through the artifice, and abſolutely refuſed the commiſſion. Æſchines, on pretence of ſickneſs, ſtaid at home to counteract the meaſures of his rival. The other ambaſſadors departed, in compliance with the requeſt of Philip, and the orders of their republic, in hopes of ſeeing a treaty fulfilled, which, they had been taught to believe, would be attended with conſequences equally advantageous and honourable.

While the ambaſſadors travelled through Eubœa, in their way to join the king of Macedon, they firſt learned that Phaleucus had been perſuaded to evacuate Nicæa. He retired towards Peloponneſus, and embarked at Corinth, with a view to ſail to Italy, where he expected to form an eſtabliſhment. But the capricious temper of his followers compelled him to make a deſcent on the coaſt of Elis. After this they re-embarked, and ſailed to Crete, where their invaſion proved fatal to their general. Having returned to the Peloponneſus, they were defeated by the Elians and Arcadians. The greater part of thoſe who ſurvived the battle fell into the hands of the enemy, by whom they were ſhot with arrows, or precipitated from rocks. A feeble remnant eſcaped to their ſhips, but periſhed ſoon afterwards in an inſurrection which they had excited in the iſle of Sicily. Philip, meanwhile, having paſſed the ſtraits of Thermopylæ, was received by the Phocians as their deliverer. He had promiſed to plead their cauſe before the Amphictyonic council, to the deciſions of which that credulous people conſented to ſubmit, well knowing that a prince who entered Greece at the head of a numerous army, might eaſily controul the reſolutions of the Amphictyons, and fondly believing that prince to be their friend. The deputies of Athens had not yet arrived; thoſe of the ſouthern republics had not even been ſummoned. The Locrians, Thebans, and Theſſalians, alone compoſed the aſſembly that was

to

to decide the fate of Phocis; a country which they had perfecuted with unrelenting hoftility in a war of ten years. The fentence was fuch as might be expected from the refentment of fuch judges. It was decreed that the Phocians fhould be excluded from the general confederacy of Greece, and for ever deprived of the right to fend repreſentatives to the council of Amphictyons: that their arms and horſes fhould be fold for the benefit of Apollo; that they fhould be allowed to keep poſſeſſion of their lands, but compelled to pay annually from their produce the value of ſixty thouſand talents, till they had completely indemnified the temple; that their cities fhould be diſmantled, and reduced to diſtinct villages, containing no more than ſixty houſes each, at the diſtance of a furlong from each other; and that the Corinthians, who had recently given them aſſiſtance, fhould be deprived of the preſidency at the Pythian games; which prerogative, together with the ſuperintendence of the temple of Delphi, as well as the right of ſuffrage in the Amphictyonic council, loſt by the Phocians, ſhould thenceforth be transferred to, and enjoyed by, the king of Macedon.

This extraordinary decree, when communicated to the Phocians, filled them with ſuch terror and diſmay, as rendered them totally incapable of acting with vigour or with union. They were unable to take meaſures for repelling the invader; a few cities only, more daring than the reſt, endeavoured to defend their walls; but their feeble reſiſtance was ſoon overcome; all oppoſition ceaſed; and the Macedonians proceeded to execute the will of the Amphictyonic council with inflexible cruelty. The wretched Phocians beheld the deſtruction of their ancient monuments and trophies, their walls levelled with the ground, the fertile banks of the Cephiſſus covered with deſolation, and the venerable cities of Daulis, Penopeus, Lilæa, and Hyampolis, which had flouriſhed above nine centuries in ſplendour and proſperity, and which will ever flouriſh in the ſong of Homer, ſo totally demoliſhed as ſcarcely to leave a veſtige of their exiſtence. After this terrible havoc, the inhabitants were driven like herds of cattle to ſettlements allotted for them, and compelled to cultivate their paternal fields for the benefit of haughty and unrelenting maſters.

The unexpected news of theſe melancholy events reached Athens in five days. The people immediately aſſembled; a decree paſſed, at the motion of Calliſthenes, which marked equally their reſentment and diſmay. It was reſolved, "that the Athenians, who uſually reſided in the country, ſhould be ſummoned to the defence of the city; that thoſe, within the diſtance of twelve miles round, ſhould, along with their perſons, tranſport their moſt valuable effects into the city or the Piræus; that thoſe at a greater diſtance ſhould reſpectively convey themſelves and their property to the neareſt places of ſtrength in the Attic territory." The people with one voice called aloud for arms: levies were prepared for the relief of Phocis; and their admiral Proxenus, who had lately returned, was ordered again to direct his courſe towards that country. The king of Macedon, appriſed of theſe tranſactions, now wrote a letter to the Athenians in that ſtyle of ſuperiority which the ſucceſs of his arms entitled him to aſſume. After acquainting them with his treatment of the Phocians, he mentions his being informed of their preparations for ſupporting that impious people, and exhorts them to lay aſide their unwarrantable deſign; but adds, "If you perſiſt, know that we are prepared for repelling your hoſtilities with firmneſs and vigour." This mortifying letter was received at the ſame inſtant that the Athenian ambaſſadors returned from Eubœa, and brought ſuch accounts of the deſtruction of the Phocians, that it appeared impoſſible to afford them any relief. All that remained was to ſave from the vengeance of their enemies the miſerable wreck of that unfortunate community. The Athenians paſſed a decree for providing them with ſettlements in Attica, or in the colonial dependencies of the republic; a meaſure which, though it was founded on gratitude and humanity towards ancient and faithful allies, gave great offence to the Theſſalians and Thebans, who were deſirous to ſhare with Philip in the ſpoils of the ruined ſtate. Orchomenus, Coronæa, Hyampolis, with other cities of leſs note in Bœotia, were, in conſequence of the deſtruction of their Phocian allies, again ſubjected to the dominion of Thebes; which, on this occaſion, prepared to act with more than uſual cruelty. But Philip, with a ſudden turn of oppoſite policy, eſpouſed the cauſe of the Bœotians with a generous ardour, extremely diſagreeable to the Thebans. His humanity, whether real or pretended, was loudly extolled by his partiſans. It redounded, however, more to his own glory, than to the benefit of the Bœotians; who, being expelled from their own country by Theban tyranny, ſought refuge in the boſom of Athens.

Having thus terminated the ſacred war in a manner ſo favourable to his own ambition, Philip, in the year before Chriſt 346, convened the members of the Amphictyonic council, to the number of two hundred, and aſſiſted in the ſacrifices offered to Apollo. The name of the pious king of Macedon, who had been the principal inſtrument of their ſucceſs, reſounded in the Pœans ſung in honour of the god. The Amphictyons ratified all the tranſactions of Philip; erected his ſtatue in the temple of Delphi, and acknowledged, by a ſolemn decree, the kingdom of Macedon as the principal member of the Hellenic body. Philip at the ſame time appointed deputies to preſide at the Pythian games, the celebration of which was nearly approaching, and to which moſt of the Grecian ſtates had already ſent their repreſentatives. The Athenians, ſtung with indignation, abſtained from this feſtival. An embaſſy was therefore diſpatched to them in the name of the Amphictyons, requiring their concurrence with meaſures embraced by the general council of Greece; and remonſtrating againſt their diſpleaſure at the aggrandiſement of a prince, with whom they had ſo lately contracted an alliance. The deliberations of the Athenian aſſembly ſhewed the extent of their own folly, and evinced the conſummate policy of Philip. They acknowledged, with dejection and anguiſh, that they had neglected the many opportunities preſented them by the favour of heaven, for repreſſing the ambition of their rival; that the time of acting with vigour and effect was now no more; that the cauſe of Greece was an empty name, ſince the Greeks ſurrendered their franchiſes to the king of Macedon; and that it became their own republic to conſult rather its ſafety than its honour, and to maintain peace with a monarch againſt whom they were by no means prepared to wage war. Even Demoſthenes recommended this reſolution; leſt, ſays he, we ſhould offend thoſe now aſſembled, who call themſelves the Amphictyons, and thus excite a general war againſt ourſelves. This opinion was univerſally approved: Macedon was acknowledged a member of the Grecian confederacy; and Iſocrates, an Athenian of the higheſt reputation, addreſſed a diſcourſe to Philip, in which he exhorted him to diſdain inglorious victories over his countrymen and friends, to employ his authority to extinguiſh for ever the animoſities of Greece, and to direct the united efforts of that country, of which Macedon now formed the head, againſt the wealth and encroachments of Perſia, its ancient and inſidious enemy.

By his intrigues, Philip thus obtained more important advantages, than he could have gained by a long ſeries of victories; but the complete conqueſt of Greece was a point not ſo eaſily effected. The Lacedæmonians, ever ready for war, ſolicited the aſſiſtance of Athens. The latter ſtate had received a conſiderable acceſſion of ſtrength, as well as of honour and reſpect, from its hoſ-

pitable reception of the diſtreſſed exiles from Phocis and Bœotia. It derived new conſideration from a general congreſs of ambaſſadors from Sparta, Thebes, Macedon, Argos, Meſſenè, and Arcadia, who, after the recent ſtruggles for conqueſt and independence, condeſcended to aſſert their reſpective claims before the Athenian aſſembly. The Lacedæmonians repreſented the league, formed againſt themſelves, as alike dangerous to Athens and to Sparta; that the ambition of Philip would not reſt ſatisfied with a partial conqueſt; his imagination graſped the dominion of Greece; and now was the only time for the two leading republics, who had ever mutually aſſiſted each other in ſeaſons of imminent danger, to make a firm ſtand in defence of the public ſafety. The Thebans, joined with the miniſters of Philip, called loudly on the Athenians to adhere to their treaty of peace recently concluded with that prince; and laboured with the utmoſt aſſiduity to ſeparate the views and intereſts of Athens and Lacedæmon on this important emergency.

The Athenian orators, many of them creatures of Philip, alſo exhorted their countrymen not to break too haſtily with a prince with whom they had ſo recently concluded an alliance, nor imprudently renew a bloody and deſtructive war, out of which they had been lately extricated with ſo much difficulty. Demoſthenes, however, pronounced a diſcourſe, which the king of Macedon is ſaid to have read with a mixture of terror and admiration. "When you hear deſcribed, O men of Athens! the continual hoſtilities by which Philip violates the peace, I obſerve that you approve the equity and patriotiſm of thoſe who ſupport the rights of the republic: but while nothing is done, on account of which it is worth while to liſten to ſuch ſpeeches, our affairs are brought to ſuch a paſs, that the more clearly we convict Philip of perfidy towards you, and of hoſtile deſigns againſt Greece, the more difficult it is to propoſe any ſeaſonable advice. The cauſe of this difficulty is, that the encroachments of ambition muſt be repelled, not by words, but by deeds. If ſpeeches and reaſoning ſufficed, we ſhould long ere now have prevailed over our adverſary. But Philip excels in actions as much as we do in arguments; and both of us obtain the ſuperiority in what forms reſpectively the chief object of our ſtudy and concern; we in our aſſemblies, Philip in the field.

"Immediately after the peace, the king of Macedon became maſter of Phocis and Thermopylæ, and made ſuch an uſe of theſe acquiſitions as ſuited the intereſt of Thebes, not of Athens. Upon what principle did he act thus? Becauſe, governed in all his proceedings, not by the love of juſtice, but by an inſatiable luſt of power, he ſaw the impoſſibility of bending the Athenians to his ſelfiſh and tyrannical purpoſes. He knew that the loftineſs of their character would never ſtoop to private conſiderations, but prefer to any advantage that he might offer them, the dictates of juſtice and of honour; and that neither their penetration, nor their dignity, could ever deſcend to ſacrifice to a partial and temporary intereſt, the general ſafety of Greece; but that they would fight for each member of the confederacy with the ſame ardour as for their own walls. The Thebans he judged (and he judged aright) to be more aſſailable; he knew their meanneſs to be ſuch, that provided he heaped benefits on themſelves, they would aſſiſt him to enſlave their neighbours. Upon the ſame principle he now cultivates, in preference to yours, the friendſhip of the Meſſenians and Argives; a circumſtance, Athenians! which highly redounds to your honour, ſince Philip thus declares his perſuaſion, that you alone have wiſdom to underſtand, and virtue to oppoſe, his deſigns; that you foreſee the drift of all his negociations and wars, and are determined to be the incorruptible defenders of the common cauſe. Nor is it without good grounds that he entertains ſuch an honourable opinion of you, and the contrary of the Thebans and Argives. When the liberties of Greece were threatened by Perſia, as they now are by Macedon, the Thebans baſely followed the ſtandard of the invaders; the Argives did not oppoſe their arms; while the magnanimous patriots, from whom you are deſcended, ſpurned offers, highly advantageous, made them by Alexander of Macedon, the anceſtor of Philip, who acted as the ambaſſador of Perſia; and, preferring the public intereſt to their own, provoked the devaſtation of their territory, and the deſtruction of their capital, and performed, in defence of Greece, thoſe unrivalled exploits of heroiſm which can never be celebrated with due praiſe, nor obliterated from the annals of time. For ſuch reaſons, Philip chooſes for his allies, Thebes, Argos, and Meſſenè, rather than Athens and Sparta. The former ſtates poſſeſs not greater ſtrength, wealth, fleets, harbours, and armies; they have not more power, but leſs virtue. Nor can Philip plead the merits of their cauſe; ſince, if Chæronæa and Orchomenus are juſtly ſubject to Thebes, Argos and Meſſenè are juſtly ſubject to Lacedæmon; nor could it be equitable to enſlave the inferior cities of Bœotia, and at the ſame time to teach thoſe of Peloponneſus to rebel.

"But Philip was compelled to this conduct, as alleged in his defence.—'Surrounded by the Theſſalian cavalry and Theban infantry, he was obliged to aſſiſt allies whom he diſtruſted, and to concur with meaſures which he diſapproved. Hence the ſevere treatment of Phocis; hence the cruel ſervitude of Orchomenus and Chæronæa. The king of Macedon, being now at liberty to conſult the dictates of his own humanity and juſtice, is deſirous to re-eſtabliſh the republic of Phocis; and, in order to bridle the inſolence of Thebes, actually meditates the fortifying of Elatæa.'—This, indeed, he meditates, and will meditate long. But, does he not meditate the deſtruction of Lacedæmon? For this purpoſe he has remitted money, he has ſent his mercenaries, he is prepared, himſelf, to march at the head of a powerful army. His preſent tranſactions ſufficiently explain the motives of his paſt conduct. It is evident that he acts from ſyſtem, and that his principal batteries are erected againſt Athens itſelf. How can it be otherwiſe? He is ambitious to rule Greece; you alone are able to thwart his meaſures. He has long treated you unworthily; and he is conſcious of his injuſtice. He is actually contriving your deſtruction, and he is ſenſible that you ſee through his deſigns. For all theſe reaſons he knows that you deteſt him, and that ſhould he not anticipate your hoſtility, he muſt fall a victim to your juſt vengeance. Hence he is ever active and alert, watching a favourable moment of aſſault, and practiſing on the ſtupidity and ſelfiſhneſs of the Thebans and Peloponneſians; for if they were not ſtupid and blind, they might perceive the fatal aim of the Macedonian policy. I once ſpoke on this ſubject before the Meſſenians and Argives; my diſcourſe, which was uſeleſs to them, may, perhaps, not unſeaſonably be repeated to you. "Men of Argos and Meſſene! you remember the time when Philip careſſed the Olynthians, as he now does you: how highly, do you think, that infatuated people would have been offended, had any man talked againſt the benefactor, who had generouſly beſtowed on them Anthemus and Potidæa? Had any man warned them againſt the dangerous artifices of Philip, would they have liſtened to his advice? Yet, after enjoying for a moment the territories of their neighbours, they were for ever deſpoiled of their own. Inglorious was their fall; not conquered only, but betrayed and ſold by one another. Turn your eyes to the Theſſalians. When Philip expelled their tyrants, could the Theſſalians ever conjecture that the ſame prince would ſubject them to the creatures of Macedon, ſtill more tyrannical and oppreſſive? When he reſtored them to their ſeat and ſuffrage in the Amphictyonic council, could they have

been perſuaded that he would one day deprive them of the management of their own revenues? As to you, Meſſenians and Argives! you have beheld Philip ſmiling and deceiving; but beware! pray to Heaven, that you may never behold him inſulting, threatening, and deſtroying. Various are the contrivances which communities have diſcovered for their defence; walls, ramparts, battlements, all of which are raiſed by the labour of man, and ſupported by continual expence and toil. But there is one common bulwark, which only the prudent employ, though alike uſeful to all, eſpecially to free cities againſt tyrants. What is that? DISTRUST. Of this be mindful; to this adhere; preſerve this carefully, and no calamity can befal you."

Philip, meanwhile, unoppoſed and unobſerved, was ſailing with a powerful armament towards Cape Tenarus, the moſt ſouthern promontory of Laconia. Having landed there without oppoſition, he was joined by the Meſſenians, Arcadians, and Argives. The united army, after ravaging the moſt valuable part of the Lacedæmonian territories, beſieged and took Trinaſus, a maritime city of conſiderable importance. The terror occaſioned among the Spartans by theſe misfortunes, was heightened by extraordinary meteors in the air, whoſe unuſual redneſs ſeemed to preſage ſome dreadful calamity. The alarm was ſo general, that it has been thought worth while to record the ſaying of a Spartan youth, who remained unmoved amidſt the public conſternation. Being aſked, "Whether he was not afraid of Philip?" "Why, (replied the generous youth,) ſhould I fear him; he cannot hinder me from dying for my country." But this manly reſolution no longer animated the great body of the Spartan nation. Unable to meet the invader in the field, they ſent Agis, the ſon of king Archidamus, to propoſe terms of accommodation, or rather to ſubmit their whole fortune to the diſpoſal of the Macedonians. The young prince coming alone and unattended, Philip expreſſed his ſurpriſe. "What, have the Spartans ſent but one!" "Am I not ſent to one?" was the manly reply of Agis. This was the expiring voice of Spartan pride; for the king of Macedon, though unwilling to provoke the deſpair of a people, whoſe degenerate virtue might yet be animated by the inſtitutions of Lycurgus and the example of Leonidas, compelled them to reſign their pretended authority over Argos, Meſſene, and Arcadia; and ſettled the boundaries of thoſe republics entirely agreeable to the wiſhes of his confederates. The king of Macedon then marched through the country amidſt the acclamations of the people, who vied with each other in beſtowing crowns and ſtatues on a prince who had generouſly reſcued them from the yoke of Sparta. At Corinth he paſſed ſome days in the houſe of Demaratus, a man totally devoted to his ſervice; but the turbulent Corinthians, who, beſides their innate hatred of kings, had particular cauſes of animoſity againſt Philip, did not conceal their unwillingneſs to owe their freedom and their ſafety to the interpoſition of a foreign tyrant. Philip was ſtrongly urged by his courtiers to puniſh their temerity; but he knew how to digeſt an affront, when forgiveneſs was more uſeful than vengeance; and repreſſed the unſeaſonable indignation of his attendants by obſerving, with admirable patience, "Were I to act with *ſeverity*, what muſt I expect from men, who repay even *kindneſs* with inſult?"

Next year Philip was occupied by ſecuring and receiving into his protection the city and republic of Cardia, occupying the neck of land which joins the Thracian Cherſoneſus to the continent. The reſt of the peninſula had long been ſubject to the Athenians, whoſe authority the citizens of Cardia always ſet at defiance. The Athenians had lately ſtrengthened the Cherſoneſites by a new colony, which had continual diſputes with the Cardians about the extent of their boundaries. Matters had actually come to a criſis, and the Cardians were ready to be overwhelmed by the ſtrength and numbers of the enemy, when they were at once defended by the Macedonian arms. This hoſtile meaſure once more rouſed the Athenians from their lethargy; but inſtead of oppoſing Philip with arms, the only means by which he might be reſiſted with any hope of ſucceſs, they employed the impotent defence of ſpeeches, reſolutions, and embaſſies. The ſubtle artifices of the king of Macedon, though ſupported by the impetuous eloquence of Python, were overcome by Hegeſippus and Demoſthenes, who ſtill unveiled the injuſtice of Philip with ſuch force of evidence, that the Athenians finally reſolved upon ſending a conſiderable armament to the Cherſoneſus, to protect their ſubjects in that peninſula. Diopeithes, who commanded the expedition, was a determined enemy to the Macedonians, and a man of courage and enterpriſe. Having provided for the defence of the Athenian ſettlements, he made an incurſion into the neighbouring country; ſtormed the Macedonian ſettlements at Crobylè and Tiriſtaſis; and having carried off many priſoners, and a conſiderable booty, lodged them in the ſafe retreat of the Cherſoneſus. On this emergency, Amphilochus, a Macedonian of rank, was ſent to treat of the ranſom of priſoners; but Diopeithes caſt him in priſon, the more ſurely to widen the breach between Athens and Macedon; and, if poſſible, to render it irreparable. The king of Macedon, when informed of theſe hoſtilities, gave free ſcope to his complaints; and his emiſſaries had an eaſier game at Athens, as Diopeithes had not only violated the peace with Macedon, but, in order to maintain his troops, had levied conſiderable contributions from the Greek ſettlements in Aſia. The partiſans of Macedon inveighed againſt this commander as a robber and pirate, the common enemy of Greeks and barbarians; Philip demanded vengeance from the juſtice of Athens, if not, he would be his own avenger; the perſonal enemies of Diopeithes joined in the outcry, and inſiſted, that ſuch a daring offender ought immediately to be recalled, and puniſhed for his miſconduct.

On this occaſion Demoſthenes undertook to defend the accuſed general, whoſe meaſures he warmly approved; and motives of private friendſhip heightening the ardour of patriotiſm, render his diſcourſe on the affairs of the Cherſoneſus one of the moſt animated and intereſting of his productions. The impeachment of Diopeithes he aſcribes entirely to malice or perfidy, which had been too ſucceſsfully employed to withdraw the attention of the Athenians from the main object of their concern, the continual encroachments of Philip, to unjuſt complaints and calumnies againſt their fellow-citizens. On this ground he proceeds, "Be not deceived, Athenians! Philip has at heart the final contrivance of all your misfortunes and diſgrace. For who can be ſo fooliſh as to believe, that the villages of Thrace ſhould form an object worthy of his ambition; that, in order to acquire them, he ſhould ſubmit to toils and dangers; that, for the ſake of the rye and millet of Thrace, he ſhould conſent to ſpend ſo many months amidſt winter ſnows and tempeſts; while, at the ſame time, he diſregarded the riches and ſplendour of Athens, your harbours, arſenals, galleys, mines, and revenues? No, Athenians. It is to get poſſeſſion of Athens, that he makes war in Thrace and elſewhere. What then ought we to do? Tear ourſelves from our indolence; not only ſupport, but augment, the troops which are on foot; that, as Philip has an army ever ready to attack and conquer the Greeks, you alſo may be ready to ſuccour and to ſave them. Raſh and violent I neither am, Athenians, nor with ever to become. The courage of a miniſter is put to an eaſy trial, who is ever ready to ſacrifice your permanent intereſt to your preſent pleaſure. But he is truly courageous, who, for the ſake of your ſafety and glory, oppoſes your moſt favourite inclinations, rouſes you from your dream of pleaſure,

diſdains

diſdains to flatter you, and having the good of his country ever in view, aſſumes that poſt in the adminiſtration in which fortune often prevails over policy, knowing himſelf reſponſible for the iſſue. Such a miniſter am I, whoſe unpopular counſels tend to render, not myſelf, but my country, GREAT."

The arguments of Demoſthenes not only ſaved Diopeithes, but animated the Athenians with a degree of vigour which they had been long unaccuſtomed to exert. A fleet was fitted out under the command of Callias, who made a deſcent on the coaſt of Theſſaly, after plundering the harbours in the Pelaſgic gulph. A conſiderable body of forces was ſent into Acarnania to repel the incurſions of Philip, aſſiſted by his kinſman and ally, Alexander of Epirus. The inhabitants of the iſland of Peperathus, truſting to the protection of Athens, expelled the Macedonian garriſon from Halonneſus. Repeated embaſſies were diſpatched to the Peloponneſians and Eubœans, exhorting them to throw off the ignominious yoke of Macedon, and to unite with their Grecian brethren againſt the public enemy. Philip was not unattentive to theſe commotions; but, his deſigns againſt the valuable cities on the Propontis and Thracian Boſphorus being ripe for execution, he was unwilling to allow any ſecondary conſideration to divert him from that important enterpriſe.

In the year before Chriſt 342, his intrigues had gained a conſiderable party in Byzantium, at the head of which was the perfidious Python, whoſe vehement eloquence gave him great influence with the multitude. A conſpiracy was formed to ſurrender one of the gates of the city; the Macedonian army of thirty thouſand men hovered round; but the deſign was diſcovered, and Philip, to ſcreen his partiſans from public vengeance, withdrew his army, and inveſted the neighbouring city of Perinthus. In Eubœa, the recent prevalence of the Macedonian party had been marked by many acts of violence and oppreſſion. The cities of Chalcis, Oreum, and Eretria, prepared to rebel, having previouſly ſolicited aſſiſtance from Peloponneſus, Acarnania, Attica, and every province of Greece, which they had any reaſon to deem favourable to their views. From other ſtates they brought back promiſes and hopes; from Athens they obtained, chiefly by the influence of Demoſthenes, a conſiderable body of troops commanded by the brave and virtuous Phocion. The orator accompanied the expedition; and being allowed to addreſs the popular aſſemblies in moſt of the cities of Eubœa, he inflamed them with ſuch animoſity againſt Philip and his partiſans, that little remained to be done by the valour of the Athenian general. The Eubœans every where took arms in defence of their freedom, the Macedonian garriſons were expelled from the principal cities, and driven from one poſt to another, till they were compelled entirely to evacuate the iſland. This event occaſioned great joy at Athens; and the principal merit being aſcribed to Demoſthenes, he was crowned by the ſenate and people with a golden crown.

The loſs of Eubœa was ill-compenſated to Philip by the military operations againſt Perinthus, in which he found an enemy of courage and perſeverance. The town was ſituated on the ſloping ridge of an iſthmus, and ſtrongly fortified both by art and nature, the houſes and ſtreets riſing one above another like the ſeats of an amphitheatre, ſo that the higher edifices overlooked and defended the lower. Having ſcoured the neighbouring country with his cavalry, Philip exhauſted, in the ſiege of Perinthus, all the military ſkill known to the ancients. He raiſed towers forty cubits high, which enabled his men to fight on equal ground with the beſieged; his miners were buſy at the foundation; at length the battering rams advanced to the wall, in which a conſiderable breach was made, and the Perinthians were reduced to the laſt extremity, when they were unexpectedly ſaved, firſt by a large ſupply of arms and proviſions from Byzantium, next by a ſtrong reinforcement of men in Perſian pay, commanded by Apollodorus, a citizen of Athens. Philip, ever laudably ſparing of the lives of his men, determined to change the ſiege into a blockade. Perinthus was ſhut up by ſea and land: part of the Macedonian troops, who had become mutinous for want of pay, were indulged in plundering the rich territory of Byzantium, while the remainder were conducted to the ſiege of Selymbria, and ſoon after of Byzantium itſelf, the taking of which places, it was hoped, might compenſate their diſappointments at Perinthus.

During theſe military operations, the Athenian councils were animated with a degree of energy and enthuſiaſm which had not appeared in them during many years, and which produced the laſt tranſitory glimpſe of ſucceſs and ſplendour, before the glory of Athens was extinguiſhed for ever. It was decreed by the ſenate and people, in the year before Chriſt 340, to fit out a fleet of an hundred and twenty galleys; but unfortunately the command was given to Chares, whoſe character rendered him as contemptible to the enemies, as he was deteſted by the allies, of the republic. The Byzantines even excluded him from their harbour; and he was defeated by Amyntas, the Macedonian admiral, off the oppoſite ſhore of Chalcedon. This diſaſter, which was occaſioned by the incapacity or treachery of their commander, made the Athenians caſt their eyes on Phocion, who, though ever ready to ſerve his country, was only called for in times of danger and calamity. Before Phocion reached the Propontis, Philip, fluſhed with his late naval ſucceſs, made an attempt to ſtorm Byzantium. Confident in the ſtrength of their walls, and the abundance of their magazines, the inhabitants of Byzantium, without riſking a ſally, allowed Philip to carry on his works. During this inaction of the townſmen, Philip determined to attempt the walls by ſurpriſe. For executing this deſign, he choſe the gloom of a tempeſtuous night; a determined band of Macedonians paſſed the ditch; the ſcaling-ladders were fixed; when the centinels of Byzantium were alarmed by the barking of maſtiffs, kept in the towers, to ſecure them in the night. The alarm ſpread with rapidity among the guards, who ruſhing tumultuouſly from their reſpective ſtations, were on the point of blindly aſſaulting each other, when a bright meteor enabled them to diſtinguiſh their friends from their foes. Having formed in ſome order, they advanced againſt the Macedonians, who had already gained the rampart; but from which they were repulſed, with dreadful ſlaughter, by ſuperior numbers. Yet the defeat of this bold enterpriſe did not diſcourage Philip from carrying on his operations; and his perſeverance muſt have prevailed over the obſtinacy of the beſieged, had not the Athenian fleet, under Phocion, arrived in the Thracian Boſphorus. The Byzantines received him with open arms; and, under his ſuperior proweſs, the troops of Philip were foiled in every rencounter. The king of Macedon, who had as much flexibility in varying his meaſures, as firmneſs in adhering to his purpoſes, was unwilling any farther to preſs his bad fortune: he judged it neceſſary to raiſe the ſiege of Byzantium, to withdraw his forces from Selymbria and Perinthus, and to leave the Athenians in full poſſeſſion of the northern ſhore of the Propontis.

Phocion, to whoſe conduct the ſafety of ſo many important cities was principally owing, ſailed from Byzantium amidſt the grateful acclamations of innumerable ſpectators. In his voyage to the Cherſoneſus, he captured a fleet of victuallers and tranſports, carrying arms and proviſions for the enemy. When he arrived in that peninſula, he repreſſed the inſolence of the Cardians, who, reinforced by a Macedonian garriſon, had undertaken an expedition againſt the city of Seſtos. He recovered ſeveral places on the coaſt of Thrace, which had

had ſubmitted to the dominion of the Macedonians; and, in concert with the inhabitants, took ſuch meaſures as ſeemed moſt proper to protect the Athenian allies in thoſe parts, from future danger. Theſe meritorious ſervices of Phocion were felt and acknowledged by the communities whom he had protected and relieved. The deliverance of the Cherſoneſus, of Perinthus, and of Byzantium, was teſtified by crowns, ſtatues, inſcriptions, and altars; and are ſtill recorded in an oration of Demoſthenes, which has deſervedly ſurvived thoſe periſhing monuments of gold and marble.

Diſappointed in his deſigns upon Byzantium, Philip turned his arms againſt Atheas, king or chief of Scythia Minor, now called Little Tartary, who had recently inſulted the Macedonian ambaſſadors that had been ſent to treat of an amicable alliance with him. Philip reaped ſuch fruits from this expedition, as might be expected by a victory over a people who had no king but their general, no god but their ſword, and no cities but the ground on which they occaſionally encamped with their herds and families. The ſpoil conſiſted in arms, chariots, twenty thouſand robuſt captives, and a greater number of mares, deſtined to repleniſh the ſtuds of Macedonia. But while Philip marched at the head of his army, thus encumbered with baggage and ſpoil, a very unexpected event threatened to terminate at once his glory and his life. Allured by the hopes of ſharing the warlike plunder of the Scythians, the barbarous Triballi, a people who had been often conquered, but never ſubdued, vigorouſly aſſaulted the Macedonians, entangled amidſt the intricate windings of the mountains of Mœſia. The confuſion and the danger was ſuch as demanded the utmoſt exertions of the king of Macedon, who ſummoned all the fortitude and firmneſs of his mind. With his voice and example he conducted his faithful guards to the heat of the battle, and fought with unexampled bravery, till the ſame weapon which pierced his horſe, laid him ſenſeleſs on the ground. The young Alexander, who fought near his ſide, derived peculiar glory from ſaving the life of his father, whom he covered with his ſhield, and defended by his ſword, until his attendants conveyed him to a place of ſafety; the ſon immediately ſucceeded to the command, and the barbarians were routed and put to flight. Philip's wound was attended with an incurable lameneſs, which he bore with much impatience. His magnanimous ſon endeavoured to remove his anxiety, by aſking, how he could be chagrined at an accident, which continually reminded him of his valour.

The Macedonian army now haſtened through Thrace, where Philip was met by deputies from the Amphictyonic council, appointing him general of their forces, and requeſting him to march into Greece, to repreſs the warlike preparations of the Athenians, who had equipped a fleet far ſuperior to the naval ſtrength of Macedon. The troops and partiſans of that kingdom were driven from their ambuſhes in Megara, and in the neighbouring territories, where they had long watched an opportunity of deſtroying the power of Athens. Demoſthenes, and Hyperides, an orator ſecond only to Demoſthenes, were diſpatched into the Peloponneſus and other parts of Greece, to perſuade the ſeveral republics to ſecond the generous ardour of the Athenians, whoſe recent ſucceſs under Phocion added great weight to the arguments and eloquence of thoſe illuſtrious ſtateſmen.

To counteract theſe menacing preparations, Philip employed ſeveral ſecret engines, which were calculated to work very deſtructively upon the Athenians. There was a man at Athens named Antiphon, who inſinuated himſelf into the popular aſſembly without the legal qualification. This defect paſſed long unobſerved, but was at length detected by Demoſthenes, when he was driven into exile, and became an active incendiary in the pay of the king of Macedon. It was agreed between Philip and Antiphon, that the latter ſhould return to Athens in diſguiſe, inſinuate himſelf into the Piræus, and lie there in concealment, until he found an opportunity to ſet fire to the Athenian docks, and thus deſtroy at once the ſheet-anchor of the republic. But the vigilance of Demoſthenes diſcovered this deſperate deſign, when on the point of execution. He immediately flew to the Piræus, dragged Antiphon from his concealment, diveſted him of his diſguiſe, and produced him at the bar of the aſſembly. Torture, which the inſtitution of domeſtic ſlavery had rendered familiar in Greece, extorted from him a reluctant confeſſion; and his enormous guilt was puniſhed with as enormous ſeverity. Had the deteſtable enterpriſe of Antiphon ſucceeded, Philip would have obtained his purpoſe of ruining Athens by a ſtroke of the meaneſt perfidy. It was on this occaſion that Demoſthenes exclaimed, "Philip is diſtinguiſhed above all his predeceſſors for collecting together the fouleſt enemies of Grecian freedom. His meaſures required the co-operation of traitors, and traitors he found more corrupt and more dexterous than ever appeared in any former age; and, what is moſt worthy of remark, the principal inſtruments of his ambition flouriſhed in the very boſom of that ſtate, whoſe public councils moſt openly oppoſed his greatneſs."

The ſeaſon for convening at Delphi the vernal aſſembly of the Amphictyons, now approached; and the Athenians particularly diſtinguiſhed their pious munificence, by ſending, among other dedications, ſeveral golden ſhields, with the following inſcription: "Taken from the Medes and Thebans when they fought againſt Greece." This offering, highly offenſive to the Theban deputies, was prematurely ſuſpended in the temple; the Thebans murmured, the Amphictyons liſtened to their complaints, and it was aſſerted in the council, that the Athenians deſerved puniſhment for preſenting their gift to the god, before it had been conſecrated with the other offerings. Pretending high indignation at theſe murmurs, Æſchines ruſhed into the aſſembly, and began a ſpirited defence of his countrymen; when he was rudely interrupted by a Locrian of Amphiſſa, a city only eight miles diſtant from Delphi, which growing populous and powerful on the ruins of Criſſa and Cirrha, had ventured to cultivate the Cirrhean plain, which, near three centuries before, had been deſolated by the Amphictyons, ſolemnly conſecrated to Apollo, and devoted to perpetual ſterility. The artful Locrian, affecting a religious zeal not leſs ardent than the patriotiſm of Æſchines, clamorouſly interrupted that orator, calling aloud in the aſſembly, that it ill became the dignity of the Amphictyons to hear with patience the juſtification, much leſs the praiſes, of Athens, a city impious and profane, which, in defiance of human and divine laws, had ſo recently abetted the execrable ſacrilege of the Phocians.

Æſchines, in reply, not only juſtified the innocence, but diſplayed the illuſtrious merit of the Athenians; and then addreſſing the Amphictyons with a look peculiarly earneſt and expreſſive, "Say, ye Grecians! ſhall men who never knew the exalted pleaſures of virtue and renown, be ſuffered to tear from us the ineſtimable rewards of glory ſo juſtly earned? Shall men, themſelves polluted by ſacrilege, and already devoted to deſtruction by the moſt awful imprecations, preſume to call the Athenians profane and impious? Look down, ye reverend guardians of religion! look down on that plain, (pointing to the Cirrhean plain, which might be ſeen from the temple,) behold theſe lands anciently devoted to the god, now appropriated and cultivated for the private emolument of the Amphiſſeans; behold the numerous buildings which they have erected there, and that accurſed port of Cirrha, juſtly demoliſhed by our anceſtors, now rebuilt and fortified." Æſchines here read the oracle of Apollo, which condemned that harbour and thoſe lands to perpetual deſolation. Then proceeding with increaſed vehemence, he ſaid, "Ye Grecians! I ſwear, that I myſelf, my children, my country, will diſcharge our duty

to heaven; and, with all the powers and faculties of mind and body, avenge the abominable violation of the conſecrated territory. Do you, Amphictyons! determine as wiſdom ſhall direct. Your offerings are prepared, your victims are brought to the altar; you are ready to offer ſolemn prayers for bleſſings on yourſelves, and on the republics which you repreſent. But conſider with what voice, with what heart, with what confidence, you can breathe out your petitions, while you ſuffer the profanation of the Amphiſſeans to paſs unrevenged. Hear the words of the imprecation, not only againſt thoſe who cultivate the conſecrated ground, but againſt thoſe who neglect to puniſh them: "May they never preſent an acceptable offering to Apollo, Diana, Latona, or Minerva the provident; but may all their ſacrifices and religious rites be for ever rejected and abhorred!"

The warmth of Æſchines occaſioned the utmoſt confuſion in the aſſembly, and thus laid the foundation of the third ſacred war, in the year before Chriſt 339. It was determined, after violent contentions, that the Amphictyons ſhould next day repair to the Cirrhean plain, in order to burn, cut down, and deſtroy, the houſes and plantations which had ſo long adorned or defiled that devoted territory. The ravagers met with little oppoſition in performing this pious devaſtation; but as they returned towards the temple, they were overtaken by a numerous party of Amphiſſeans, who threw them into diſorder, took ſeveral priſoners, and purſued the reſt to Delphi. The ſignal of war was now raiſed; the inſulted Amphictyons, in whoſe perſons the ſanctity of religion had been violated, complained to their reſpective republics, while the recent audacity of the Amphiſſeans aggravated their ancient crimes and enormities. But the council loudly declaimed againſt the lukewarm indifference of the Grecian ſtates, in a war which ſo deeply concerned the national religion. It became the Amphictyons, therefore, as the miniſters of Apollo, and the guardians of his temple, to ſeek out and employ ſome more powerful inſtrument of the divine vengeance. Philip of Macedon had formerly given proof of his pious zeal in the Phocian war. That prince was now named as a general the beſt qualified to defend the cauſe of Apollo and the ſacred ſhrine, and a deputation of the Amphictyons was ſent to Philip in Thrace. He received their meſſage with great cordiality, and declared his veneration for the commands of the council, which he ſhould be ever ready to obey. The vigilant prince ſoon provided a ſufficient number of tranſports to convey his army into Greece, notwithſtanding the Athenians had taken a decided part againſt him, and that their admirals Chares and Proxenus were prepared to intercept his paſſage with a ſuperior naval force. To baffle this oppoſition, Philip, as uſual, employed a ſtratagem. A light brigantine was diſpatched to Macedon with letters of ſuch import as gave reaſon to believe that he purpoſed immediately returning into Thrace. Beſides writing to Antipater, his principal confidant, he took care to maſk his artifice, by ſending letters to his queen Olympias. The brigantine deſignedly fell into the hands of the Athenians. The diſpatches were ſeized and read; but the letter for the queen was politely forwarded to its deſtination. The Athenian admirals quitted their ſtation, and Philip arrived, without oppoſition, on the coaſt of Locris, from whence he proceeded to Delphi.

Though the Macedonians were more than ſeemed neceſſary for the reduction of Amphiſſa, the king diſpatched circular letters through moſt parts of Greece, requiring from the Thebans, Peloponneſians, and other ſtates, the aſſiſtance of their combined arms to maintain the cauſe of the Amphictyons and Apollo. The Thebans, intimidated by a powerful army in their neighbourhood, ſent a ſmall body of infantry to join the ſtandard of Philip. The Lacedæmonians, long diſguſted with the meaſures of Greece, were firm in preſerving a ſullen neutrality; while the Athenians, awakened by the activity of Demoſthenes to a ſenſe of their danger, oppoſed Philip with ten thouſand mercenaries, deſpiſing the threats of the oracle againſt thoſe who took part with Amphiſſa. The king of Macedon, however, without waiting for any farther reinforcement than that which he had received from the Thebans, beſieged, took, and garriſoned, that unfortunate city; and having routed and put to flight the Athenian mercenaries, ſoon ſpread the terror of his arms around the neighbouring territory. The Athenians, now dreading that they muſt ſoon have their own walls to defend againſt the victorious invader, ſent an embaſſy to Megara, Eubœa, Leucas, Corinth, Corcyra, and Achaia, each of which favourably received the ambaſſadors, and entered into a league againſt Macedon. Thebes fluctuated in uncertainty, hating the Athenians as rivals, and dreading Philip as a tyrant. The ſituation of the Theban territory, through which Philip muſt march before he could invade Attica, rendered the deciſion of that people peculiarly important. To gain or to retain their friendſhip, the intrigues of Philip, and the eloquence of Athens had been employed with unwearied aſſiduity. The Thebans temporiſed, deliberated, reſolved, and changed their reſolutions. The partiſans of Athens were moſt numerous, thoſe of Macedon moſt active, while the great body of the Theban people heard the clamours and arguments of both parties with that ſtupid indifference, and took their meaſures with that lethargic ſlowneſs which diſgraced their character. To fix their wavering irreſolution, Philip at length determined to ſeize on Elatæa, a city conveniently ſituate for receiving reinforcements from Theſſaly and Macedon, commanding the paſſage into Bœotia, diſtant only two days march from Attica, and which, being garriſoned by a powerful army, might continually alarm the ſafety of Thebes and Athens. Philip drew the greater part of his troops thither, repaired and ſtrengthened the walls, and having thus ſecured himſelf from ſurpriſe, watched a favourable opportunity of inflicting puniſhment on the Athenians, who had given him ſufficient ground to repreſent them as the enemies of the Amphictyonic council, by whoſe authority the king of Macedon affected to be guided in all his operations.

On the firſt tidings that Philip had taken poſſeſſion of Elatæa, the people of Athens were all conſternation and alarm, until Demoſthenes exhorted them to ſhake off the unmanly terror which had ſurpriſed them; and, inſtead of fearing for themſelves, to fear only for their neighbours, whoſe territories were more immediately threatened, and who muſt ſuſtain the firſt ſhock of the invaſion. "Let your forces," continued he, "immediately march to Eleuſis, in order to ſhow the Thebans, and all Greece, that as thoſe who have ſold their country are ſupported by the Macedonian forces at Elatæa, ſo you are ready to defend with your hereditary courage and fortune thoſe who fight for liberty. Let ambaſſadors be ſent to Thebes, to remind that republic of the good offices conferred by your anceſtors; to aſſure the Thebans, that you do not conſider them as aliens; that the people of Athens have forgot all former hoſtilities with the citizens of Greece, and will never forſake the cauſe of their common country, which is in a peculiar manner the cauſe of Thebes." Theſe propoſals being received with general approbation, Demoſthenes was immediately diſpatched to Thebes; the Thebans received with gratitude the proffered aſſiſtance of Athens; and the Athenian army having ſoon after taken the field, were admitted within the Theban walls, and treated with all the diſtinctions of ancient hoſpitality.

Meanwhile Philip having advanced towards the Bœotian frontier, his detached parties were foiled in two ſkirmiſhes with the confederates. Regardleſs of theſe loſſes, he proceeded with his main body, thirty-two thouſand ſtrong, to the plain of Chæroneæa, which was

conſidered by Philip as well adapted to the operations of the Macedonian phalanx. The generals of the confederate Greeks advanced towards the ſame ſpot, accompanied by the Thebans, and the ſcanty reinforcements raiſed by the iſlands and ſtates of Peloponneſus, which had joined their alliance. Their army amounted to thirty thouſand men, animated by the nobleſt cauſe for which men can fight, but commanded by the Athenians Lyſicles and Chares, the firſt but little, and the ſecond unfavourably, known; and by Theagenes the Theban, a perſon ſtrongly ſuſpected of treachery.

When the day approached for ſapping the tottering foundations of the republics of Greece, which Philip had been gradually undermining for twenty-two years, both armies formed in battle array before the riſing of the ſun. The right wing of the Macedonians was headed by Philip, who judged proper to oppoſe in perſon the impetuous fury of the Athenians. His ſon Alexander, only nineteen years of age, but ſurrounded by experienced officers, commanded the left wing, which faced the Sacred Band of the Theban army. The auxiliaries were poſted in the centre. In the beginning of the action, the Athenians charged with their uſual impetuoſity, and repelled the oppoſing diviſions of the enemy; but the youthful ardour of Alexander obliged the Thebans to retire, and the young prince completed their diſorder, by purſuing the ſcattered multitude with his Theſſalian cavalry. Meantime the Athenian generals, too much elated by their firſt advantage, loſt the opportunity to improve it; for having repelled the centre and right wing of the Macedonians, except the phalanx of choſen men, under the immediate command of the king, they, inſtead of attempting to break this formidable body by attacking it in flank, preſſed forward againſt the fugitives, the vain Lyſicles exclaiming in triumph, "Purſue, my brave countrymen! let us drive the cowards to Macedon." Philip obſerved this raſh folly with contempt, and ſaying to thoſe around him, "Our enemies knew not how to conquer," commanded his phalanx, by a rapid evolution, to gain an adjacent eminence, from which they poured down, firm and collected, on the advancing Athenians, whoſe confidence of ſucceſs had rendered them inſenſible of their danger. But the irreſiſtible ſhock of the Macedonian ſpear converted their fury into deſpair. Above a thouſand fell, two thouſand were taken priſoners; the reſt eſcaped by a precipitate flight. Of the Thebans more were killed than taken. Few of the confederates periſhed, as they had little ſhare in the action, and as Philip, perceiving his victory to be complete, gave orders to ſpare the vanquiſhed, with a clemency unuſual in that age, and not leſs honourable to his underſtanding than his heart; ſince his humanity thus ſubdued the minds, and gained the affections, of his enemies.

According to the Grecian cuſtom, the battle was followed by an entertainment, at which the king, preſiding in perſon, received the congratulations of his friends, and the ſupplications of the Athenian deputies, who craved the bodies of their ſlain. Their requeſt, which ſerved as an acknowledgment of their defeat, was readily granted; but, before they availed themſelves of the permiſſion to carry off their dead, Philip, who with his natural intemperance had protracted the entertainment till morning, iſſued forth with his licentious companions to viſit the field of battle; their heads crowned with feſtive garlands, their minds intoxicated with wine and victory. Having proceeded to that quarter of the field where the Athenians had fought and fallen, the king abandoned himſelf to all the levity and littleneſs of petulant joy. Inſtead of being impreſſed with a deep ſenſe of his recent danger, and with gratitude to heaven for his eſcape, Philip only compared the boaſtful pretenſions with the mean performances of his Athenian enemies; and, ſtruck by this contraſt, rehearſed, with inſolent mockery, the pompous declaration of war lately drawn up by the ardent patriotiſm of Demoſthenes. It was on this occaſion that Demades at once rebuked the folly and flattered the ambition of Philip, by aſking him, Why he aſſumed the character of Therſites, when fortune aſſigned him the part of Agamemnon? Philip felt the rebuke, and his ambition immediately gave place to moderation. He reſtored, without ranſom, the Athenian priſoners; who, at departing, having demanded their baggage, were alſo gratified in this particular; the king pleaſantly obſerving, that the Athenians ſeemed to think he had not conquered them in earneſt. Soon afterwards he diſpatched his ſon Alexander, and Antipater the moſt truſted of his miniſters, to offer them peace on ſuch favourable terms as they had little reaſon to expect. They were required to ſend deputies to the iſthmus of Corinth, where, to adjuſt their reſpective contingents of troops for a Perſian expedition, Philip purpoſed aſſembling, early in the ſpring, a general convention of all the Grecian ſtates; they were ordered to ſurrender the iſle of Samos, which formed the principal ſtation of their fleet, and the main bulwark and defence of all their maritime poſſeſſions; but they were allowed to enjoy, unmoleſted, the Attic territory, with their hereditary form of government, and flattered by the acquiſition of Oropus, for which they had ſo long contended with the Thebans. It was not merely in being deprived of this city, that the Thebans experienced the indignation of the conqueror. From the tranſactions between Macedon and Thebes, in the early part of his reign, Philip thought himſelf entitled to treat that people, not as open and generous enemies, whoſe ſtruggle for freedom deſerved his clemency, but as faithleſs and inſidious rebels, who merited all the ſeverity of his juſtice.

The arguments of the wiſeſt portion of the Athenian aſſembly for accepting the peace proffered by Philip, were ſtrengthened and confirmed by the return of Demades, with the priſoners taken at Chæronæa. Ambaſſadors were diſpatched to the king of Macedon, to accept and ratify the treaty of peace, upon the terms which he had condeſcended to offer; and the only marks of deference ſhewn to the patriotic party, who ſtill clamoured for war, were, that Demochares, who oſtentatiouſly affected a rude boldneſs of ſpeech againſt Philip, was named among the ambaſſadors; and that Demoſthenes, the irreconcileable enemy of that prince, was appointed to pronounce the funeral oration in honour of the ſlain. This diſtinguiſhed office conferred on Demoſthenes, ſhewed that, notwithſtanding the unfortunate iſſue of his counſels, the Athenians ſtill approved his principles and his patriotiſm; but the complexion of the times no longer admitted thoſe daring flights of elevated fancy to which he had been accuſtomed to ſoar. One tranſient flaſh of light breaks forth towards the end of his diſcourſe, when, commemorating the glory of the ſlain, he ſays, that the removal of thoſe zealous patriots from their country was like taking the ſun from the world; a figure bold, yet juſt; ſince, after the battle of Chæronæa, there remained no further hopes of reſiſting the conqueror—the dignity of freedom was for ever loſt, and the gloom of night and tyranny thickened over Greece.

Philip, thus become ſole arbiter of the country, adminiſtered the religion, decided the differences, and commanded the valour, of ſoldiers and freemen. Perſonal merit entitled him to hold the ſceptre, which, being derived from the gods, could not long be ſwayed by unworthy hands. The ſuperiority of his abilities, the vigilant and impartial juſtice of his adminiſtration, formed the main pillars of his prerogative; ſince, according to the principles and feelings of the Macedonians, he who infringed the rights of his ſubjects, ceaſed from that moment to be a king. He affected to preſerve inviolate the ancient forms of the republican conſtitution, and determined to govern the Greeks by the ſame

policy

PHILIP, KING OF MACEDON.

London, Published as the Act directs, July 4th 1807, by J. Wilkes.

policy with which he had ſubdued them. While Macedonian garriſons kept poſſeſſion of Thermopylæ and the other ſtrong holds of Greece, the active partiſans of Philip controuled the reſolutions and directed the meaſures of each particular republic. The ſuperintendence of the ſacred games, as well as of the Delphic temple, rendered him the only viſible head of the national religion: in conſequence of the double right of preſiding and voting in the Amphictyonic council, he appeared in the character of the ſupreme civil magiſtrate of Greece; and his illuſtrious victory at Chæronæa over the only communities that dared to oppoſe his greatneſs, pointed him out as the general beſt entitled to conduct the military force of Greece and Macedon in the projected invaſion of Perſia; an authority which, as he might have aſſumed without blame, he received with greater applauſe from the impartial ſuffrages of the people.

This condeſcenſion appeared highly flattering to the Greeks aſſembled at Corinth, where Philip, the year following the battle of Chæronæa, held a general convention of the Amphictyonic ſtates. In this aſſembly, Dius of Epheſus repreſented, with affecting energy, the vexations and oppreſſion which the Greek colonies of Aſia daily experienced from the rapacious cruelty of the Perſian ſatraps. The voice of the aſſembly approved his complaint, while they recollected, with indignation, the continual outrages of a people who had anciently invaded their country, inſulted their religion, burned their temples, and nouriſhed thoſe cruel animoſities which had long filled every part of Greece with ſedition and blood. Philip had private wrongs to urge againſt the Perſians; yet he inſiſted chiefly on their public injuries, and notorious enmity to the whole Grecian name, the honour of which could only be redeemed by a ſucceſsful expedition into Aſia. This expedition was determined with univerſal conſent; and the troops which they reſpectively raiſed, amounted to two hundred and twenty thouſand foot, and fifteen thouſand horſe, excluſive of the Macedonians; a prodigious force, of which the domeſtic diſſenſions of the Greeks had hitherto, perhaps, prevented them from forming an adequate notion. On no former occaſion had the ſeveral republics appeared ſo thoroughly united in one common cauſe; never had they ſhewn themſelves ſo ſenſible of their combined ſtrength; never had they teſtified ſuch general alacrity to take the field, or ſuch unlimited confidence in the abilities of their commander.

Philip, having diſpatched Parmenio with a body of troops to protect the Aſiatic colonies, was prevented from immediately following that commander, by an inſurrection of the Illyrian tribes. This unſeaſonable diverſion from the greateſt enterpriſe of his reign, was rendered more formidable by the domeſtic diſcord which ſhook the palace of Philip. A ſpirit leſs intolerant than that of Olympias, mother of Alexander, might have been juſtly provoked by the continual infidelities of her huſband, who, whether at home or abroad, in peace or in war, never ceaſed to augment the number of his wives or concubines. The generous mind of Alexander muſt naturally have eſpouſed the cauſe of his mother, although his own intereſt had not been deeply concerned in preventing Philip from continually giving him ſo many new rivals to the throne. The young prince defended the rights of Olympias and his own, with the impetuoſity natural to his character; at the nuptials of Philip with Caſſandra, an open rupture broke out between the imperious father and his haughty ſon; and the latter, concluding all thoſe to be his own friends who were enemies to the former, ſought refuge among the rebellious Illyrians, who were already in arms againſt their ſovereign. The dexterity of Philip extricated him from theſe difficulties. Having conquered the Illyrians, he ſoftened Alexander by aſſuring him that his illuſtrious merit, which was alike admired in Greece and Macedon, had not eſcaped the anxious vigilance of a parent, who, by giving him many rivals to the throne, had only afforded him an opportunity of ſurpaſſing them all in glory. Soothed by this condeſcenſion, Olympias and her ſon again appeared at court with the diſtinction due to their rank; and to announce and confirm this happy reconcilement with his family, Philip married his daughter Cleopatra to the king of Epirus, maternal uncle of Alexander; and celebrated the nuptials by a magnificent feſtival which laſted ſeveral days, during which the Greeks and Macedonians vied with each other in ſhewing their reſpect towards their common general and maſter.

Amidſt the tumultuous amuſements of this feſtivity, Philip appeared in public with unguarded confidence in the fidelity and attachment of his ſubjects: but proceeding one day from the palace to the theatre, he was ſtabbed to the heart by Pauſanias, a Macedonian. Whether the aſſaſſin was ſtimulated by private reſentment, or prompted by the ill-appeaſed rage of Olympias, or inſtigated to commit this atrocity by the Perſian ſatraps, is equally uncertain; but the laſt was aſſerted by Alexander, who alleged the aſſaſſination of his father among his reaſons for invading the Perſian empire.

Thus, in the year before Chriſt 336, fell Philip of Macedon, in the forty-ſeventh year of his age, and twenty-fourth of his reign; the firſt prince whoſe life and actions hiſtory hath deſcribed with ſuch regular accuracy and circumſtantial fulneſs, as render his adminiſtration a matter of inſtruction to ſucceeding ages. With a reach of foreſight and ſagacity peculiar to himſelf, he united all the prominent features of the Grecian character, valour, eloquence, addreſs, flexibility to vary his conduct without changing his purpoſe, the moſt extraordinary powers of application and perſeverance, of cool combination and ardent execution. Intercepted in the middle of his career by the hand of an aſſaſſin, he was prevented from undertaking the juſteſt and nobleſt deſign of his reign; a deſign which he had long meditated, and in which his near proſpect of ſucceſs promiſed to reward the labours and dangers of his toilſome life. Had not his days been ſhortened by a premature death, there is reaſon to believe that he might have ſubdued the Perſian empire; an enterpriſe more dazzling, though leſs difficult, than the exploits which he had already atchieved. Had that event taken place, Philip muſt have reached unbounded greatneſs; and, in the opinion of poſterity, would perhaps have ſurpaſſed the glory of all kings and conquerors, who either preceded or followed him. Yet, even on this ſuppoſition, there is not any man of probity, who, if he allows himſelf time for ſerious reflection, would purchaſe the imagined grandeur and proſperity of the king of Macedon, at the price of his artifices and crimes; and to a philoſopher, who conſidered either the means by which he had obtained his triumphs, or the probable conſequences of his dominion over Greece and Aſia, the buſy ambition of this mighty conqueror would appear but a deceitful ſcene of ſplendid miſery.

From the ACCESSION of ALEXANDER the GREAT, to the SUBJUGATION of GREECE by the ROMANS.

Though no regular ſucceſſion had been ſettled to the throne of Macedon, Alexander had not much to apprehend from the rivalſhip of his brothers, ſince Ptolemy, born of Arſinoë, and afterwards king of Egypt, was reputed to be the ſon of Lagus, to whom Philip had married Arſinoë, while ſhe was with child by himſelf; and Aridæus, the ſon of Philina, who, for ſix years after the death of Alexander, held a pageant royalty in the eaſt, by the terror of his brother's name, and through the diſcordant ambition of his lieutenants, poſſeſſed not vigour of mind to diſpute the ſucceſſion. Yet Alexander's title was conteſted by Amyntas, ſon of Perdiccas, the elder brother of Philip, in whoſe name the laſt-

mentioned prince originally adminiſtered the government, till the tender age of Amyntas being rejected by the Macedonians, Philip ſo little feared the revival of his claim, that he had given him his daughter Cyna in marriage. This new advantage ſtrengthened the pretenſions of Amyntas, which, it was probable, would be warmly ſupported by Attalus, the perſonal enemy of Olympias and her ſon, of whom the former had recently put to death his kinſwoman Cleopatra, with ſhocking circumſtances of cruelty. But Alexander privately took meaſures for cruſhing thoſe dangerous enemies; and, being acknowledged king of Macedon, he haſtened into Greece, to carry forward the projected expedition againſt Perſia.

Having entruſted to Antipater, one of the moſt reſpected of his father's counſellors, the affairs of Greece and Macedon, and committed to that general an army of above twenty thouſand men, to maintain domeſtic tranquillity in thoſe countries, he departed early in the ſpring of the year 334 before Chriſt, at the head of above five thouſand horſe, and ſomewhat more than thirty thouſand infantry. The armament landed without oppoſition on the Aſiatic coaſt; the Perſians, though long ago appriſed of the intended invaſion, having totally neglected the defence of their weſtern frontier. The cauſes of this negligence reſulted, in ſome degree perhaps, from the character of the prince, but ſtill more from that of the nation. The provinces had ceaſed to maintain any regular communication with the capital, or with each other. The ſtanding military force proved inſufficient to keep in awe the diſtant ſatraps or viceroys. The ties of a common religion or language, or the ſenſe of a public intereſt, had never united into one ſyſtem this diſcordant maſs of nations, which was ready to crumble into pieces at the touch of an invader. When to theſe unfavourable circumſtances we join the reflection, that under the younger Cyrus, twelve thouſand Greeks baffled the arms, and almoſt divided the empire, of Perſia, we ſhall not find much reaſon to admire the magnanimity of Alexander in undertaking his eaſtern expedition; unleſs we are at the ſame time appriſed, that Darius was deemed a brave and generous prince, beloved by his Perſian ſubjects, and aſſiſted by the valour of fifty thouſand Greek mercenaries.

While Alexander purſued his march along the coaſt, Arſites, Spithridates, Memnon, and other governors of the maritime provinces, aſſembled in the town of Zeleia, diſtant ſixty miles from the Helleſpont. Memnon the Rhodian was the ableſt general in the ſervice of Darius. He repreſented the danger of reſiſting the Macedonian infantry, who were ſuperior in number, and encouraged by the preſence of their king. That the invaders, fiery and impetuous, were now animated by hope, but would loſe courage on the firſt diſappointment. Deſtitute of magazines and reſources, their ſafety depended on ſudden victory. It was the intereſt of the Perſians, on the other hand, to protract the war, and above all to avoid a general engagement. They ought to trample down the corn with their numerous cavalry, deſtroy all other fruits of the ground, and deſolate the whole country, without ſparing the towns and villages. Some rejected this advice, as unbecoming the dignity of Perſia; Arſites, governor of Leſſer Phrygia, declared with indignation, that he would never permit the property of his ſubjects to be ravaged with impunity. Theſe ſentiments the more eaſily prevailed, becauſe many ſuſpected the motives of Memnon. It was determined, therefore, by this council of princes, to aſſemble their reſpective forces with all poſſible expedition, and to encamp on the eaſtern bank of the Granicus, a river which falls into the Propontis.

The ſcouts of Alexander having brought him intelligence of the enemy's deſign, he inſtantly determined to give them battle. The advanced guard, conſiſting of horſemen armed with pikes, and five hundred light infantry, commanded by Hegelochus, were detached to examine the fords of the Granicus, and to obſerve the diſpoſition of the enemy. They returned to acquaint Alexander, that the Perſians were advantageouſly poſted on the oppoſite bank, their horſe amounting to twenty thouſand, and their foreign mercenaries, drawn up on the ſlope of a riſing ground, behind the cavalry, ſcarcely leſs numerous. Notwithſtanding this intelligence, the young prince determined to paſs the river. Having advanced within ſight of the hoſtile ranks, his horſe ſpread to the right and left, the maſſy column of infantry opened, and the whole formed along the bank in order of battle. The phalanx, divided into eight ſections, compoſed the main body, which occupied the centre; the Macedonian cavalry formed the right wing; the Grecian, the left. While Alexander made theſe diſpoſitions, the cautious Parmenio approached, and remonſtrated againſt paſſing the Granicus in the face of a ſuperior enemy. The river, he obſerved, was deep and full of eddies; its banks abrupt and craggy; "it would be impoſſible, therefore, to march the Macedonians in front, and if they advanced in columns, their flanks muſt be expoſed naked and defenceleſs." Theſe prudential conſiderations prevailed not with Alexander, who declared that the Macedonians muſt act with equal promptitude and vigour, and perform ſomething worthy of the terror which they bore. Saying this, he mounted his horſe, aſſumed the command of the right wing, and committed the left to Parmenio.

Animated by the hope of ſoon cloſing with the enemy, he diſdained to employ military engines. He coolly and judiciouſly diſtributed his orders; a ſolemn ſilence enſued; the hoſtile armies beheld each other with reſentment or terror. This ſolemn pauſe was ſoon broken by the Macedonian trumpet, which, on a ſignal from Alexander, reſounded from every part of the line. His brother Ptolemy, as had been previouſly directed, rode forth at the head of a ſquadron of cuiraſſiers, followed by two bodies of light dragoons, and a battalion of infantry commanded by Amyntas. While theſe troops boldly entered the Granicus, Alexander advanced with the choſen cavalry on the right wing, followed by the archers and Agrians. In paſſing the river, both Alexander and Ptolemy led their troops obliquely down the current, to prevent, as much as poſſible, the Perſians from attacking them in flank, as they ſucceſſively reached the ſhore. The Perſian cavalry behaved with courage; the firſt ſquadron of the Macedonians were driven back into the ſtream. But Alexander, who animated the companions with his voice and arm, maintained his ground on the bank, and thought he had gained the battle, when he obtained an opportunity of fighting. In the equeſtrian engagement which followed, the Macedonians owed much to their ſkilful evolutions and diſcipline; ſtill more to their ſtrength and courage; and not a little to the excellence of their weapons, which far ſurpaſſed the brittle javelins of the enemy.

Meanwhile Parmenio croſſed the Granicus, at the head of the left wing, with equal ſucceſs, but unequal glory, becauſe Alexander had already proved, by his example, that the difficulty might be overcome, which would have otherwiſe appeared inſurmountable. The attention of the enemy was ſo deeply engaged by the ſucceſſive attacks of the cavalry, that they ſeem not to have made much oppoſition to the paſſage of the phalanx. But before this powerful body of infantry had croſſed the river, the Macedonian horſe had already reaped the faireſt honours of the field. Alexander animated them by his preſence, and, after performing all the duties of a great general, diſplayed ſuch perſonal acts of proweſs as will be more readily admired than believed by the modern reader. But in the cloſe combats of antiquity, the forces, when once thoroughly engaged, might be ſafely abandoned to the direction of their own reſentment and courage, while the commanders

diſplayed

diſplayed the peculiar accompliſhments to which they had been trained from their youth, in the more conſpicuous parts of the field. Alexander was eaſily diſtinguiſhed by the glittering of his armour, and the alacrity of his attendants. The braveſt of the Perſian nobles impatiently waited his approach. He darted into the midſt of them, and fought till he broke his ſpear. Having demanded a new weapon from Aretes, his maſter of horſe, Aretes ſhewed him his own ſpear, which was likewiſe broken. Demaratus the Corinthian ſupplied the king with a weapon. Thus armed, he rode up, and aſſaulted Mithridates, ſon-in-law of Darius, who exulted before the hoſtile ranks. While Alexander beat him to the ground, he was himſelf ſtruck by Rœſaces with a hatchet. His helmet ſaved his life. He pierced the breaſt of Rœſaces; but a new danger threatened him from the ſcimitar of Spithridates. The inſtrument of death already deſcended on his head, when Clitus cut off the arm of Spithridates, which fell with the graſped weapon.

The heroiſm of Alexander animated the valour of the Companions, and the enemy firſt fled where the king commanded in perſon. In the left wing, the Grecian cavalry muſt have behaved with diſtinguiſhed merit, ſince the Perſians had begun on every ſide to give way before the Macedonian infantry had completely paſſed the river. The ſtern aſpect of the phalanx, ſhining in ſteel and briſtling with ſpears, confirmed the victory. Above a thouſand Perſian horſe were ſlain in the purſuit. The foot, conſiſting chiefly of Greek mercenaries, ſtill continued in their firſt poſition, petrified by aſtoniſhment. While the phalanx attacked them in front, the victorious cavalry aſſailed their flanks. Surrounded on all ſides, they fell an eaſy prey; two thouſand ſurrendered priſoners, the reſt periſhed. The battle alſo proved fatal to moſt of the Perſian commanders. Arſites, the chief adviſer of the engagement, died in deſpair by his own hand. The generals Niphates and Petenes, Omares leader of the mercenaries, Spithridates ſatrap of Lydia, Mithrobuzanes governor of Cappadocia, Mithridates ſon-in-law of Darius, and Arbupales ſon of Artaxerxes, were numbered among the ſlain. Such illuſtrious names might lead us to ſuſpect, that the Perſians were ſtill more numerous than Arrian repreſents them; and it is ſcarcely to be believed, that in ſuch an engagement Alexander ſhould have loſt only eighty-five horſemen, and thirty light infantry. Of the former, twenty-five belonged to the royal band of Companions. By command of Alexander, their ſtatues were erected by Lyſippus, in the Macedonian city of Dium.

This important victory enabled Alexander to diſplay both his humanity and his prudence. He declared the parents and children of the deceaſed thenceforth exempted from every ſpecies of tribute. He carefully viſited the wounded, and heard with patience and commendation their boaſted exploits. The Perſian commanders were interred; and the Greeks, both officers and ſoldiers. The Grecian captives were condemned to work in the Thracian mines, as a puniſhment for bearing arms againſt the cauſe of their country. But even this ſeverity Alexander ſoftened by a very ſeaſonable compliment to the Athenians, whoſe city he preferred to be the repoſitory of his trophies and renown. Immediately after the battle, he ſent three hundred ſuits of Perſian armour, as dedications to Minerva in the citadel. This magnificent preſent was inſcribed with the following words: "Gained by Alexander, ſon of Philip, and the Greeks, from the barbarians of Aſia." The battle of the Granicus alſo opened to Alexander the conqueſt of Ionia, Caria, Phrygia; in a word, all the Aſiatic provinces weſt of the river Halys, which had anciently formed the powerful monarchy of the Lydians. Many of the walled towns ſurrendered at his approach. Sardis, the ſplendid capital of Crœſus, opened its gates, and once more obtained the privilege of being governed by its ancient laws, after enduring, above two centuries, the arbitrary yoke of Perſia. The Grecian cities on the coaſt were delivered from the burden of tribute, and the oppreſſion of garriſons; and, under the auſpices of a prince who reſpected their ancient glory in arts and in arms, reſumed the enjoyment of their hereditary freedom.

Miletus and Halicarnaſſus now alone retarded the progreſs of the conqueror. The latter place, commanded by Memnon the Rhodian, made a memorable defence. Alexander had ſcarcely ſat down before it, when the garriſon, conſiſting of Greeks and Perſians, ſallied forth, and maintained a deſperate conflict. Having repelled them with much difficulty, he undertook the laborious work of filling up a foſs thirty cubits broad, and fifteen deep, which the beſieged, with incredible diligence, had ſunk round their walls. This being effected, he advanced wooden towers, on which the Macedonians erected their battering engines, and prepared to aſſault the enemy on equal ground. But a nocturnal ſally impeded theſe preparations; a ſecond engagement was fought with ſtill greater fury than the firſt; three hundred Macedonians were wounded, while darkneſs prevented their uſual precaution in guarding their bodies. At length various breaches were made in the walls; and from the numbers who had periſhed, or been wounded, in repeated conflicts, Memnon and his colleagues perceived that much longer reſiſtance was impoſſible. In this emergency they diſplayed the ſame deciſive boldneſs which had appeared in every part of their defence. Having ſummoned the braveſt of their adherents, they, in the night-time, ſet fire to a wooden tower, which they had erected for defence againſt the ſhocks of the enemy's engines, and for protection to their arſenal and magazines, and eſcaped to two neighbouring caſtles of great ſtrength. About midnight, Alexander perceived the raging flames, and early the next day he reconnoitred the caſtles, and perceiving that they could not be taken without much loſs of time, he reluctantly demoliſhed Halicarnaſſus, in the year before Chriſt 334, that it might never thenceforth ſerve as a retreat to his enemies.

Before leaving Caria, Alexander committed the adminiſtration to Ada, the hereditary governeſs of that province. Ada was the ſiſter of Hidricus, on whoſe deceaſe ſhe was entitled to reign, both by the Carian laws and thoſe of Upper Aſia, where female ſucceſſion had been eſtabliſhed ever ſince the age of Semiramis. But the great king, with the uſual caprice of a deſpot, had rejected the claim of Ada, and ſeated a pretender on her tributary throne. The injured princeſs, however, ſtill maintained poſſeſſion of the fortified city Alinda. When Alexander appeared in Caria, Ada haſtened to meet him, and voluntarily ſurrendered to him her city. As the king always repaid favours with intereſt, he committed to her the government of the whole province, and left a body of three thouſand foot and two hundred horſe, to ſupport her authority. His meaſures in other reſpects were equally deciſive and prudent. The Perſian fleet, ſupplied by Egypt, Phœnicia, and the maritime provinces of Lower Aſia, four times out-numbered his own; yet, ſmall as it was, he determined to diſcharge it, declaring to his lieutenants, that by conquering the land, he ſhould render himſelf maſter of the ſea, ſince every harbour that ſurrendered to him muſt diminiſh the naval reſources of the enemy. Agreeably to this judicious plan, he purſued his journey through the ſouthern provinces of the Aſiatic peninſula, while Parmenio traverſed the central countries of Lydia and Phrygia. At the ſame time Cleander was diſpatched into Greece to raiſe new levies; and ſuch ſoldiers as had married ſhortly before the expedition, were ſent home to winter with their wives; a meaſure which extremely endeared Alexander to the army, and enſured the utmoſt alacrity of his European ſubjects in furniſhing ſupplies towards the enſuing campaign.

After the deciſive battle of the Granicus, he experienced little reſiſtance from the numerous forts and garriſons in Lower Aſia. The tributary princes and ſatraps readily ſubmitted to a milder and more magnanimous maſter; and the Grecian colonies on the coaſt eagerly eſpouſed the intereſt of a prince who, on all occaſions, avowed his partiality for their favourite inſtitutions. In every province or city which he conquered, he reſtored to the Aſiatics their hereditary laws; to the Greeks, their ancient democracy. Into whatever country he marched, he encouraged uſeful induſtry, and alleviated public burdens. His taſte and his piety alike prompted him to repair the ſacred and venerable remains of antiquity. He conſidered the barbarians, not as ſlaves, but as ſubjects; the Greeks, not as ſubjects, but allies; and both perceived in his government ſuch moderation and equity, as they had never experienced either from the deſpotiſm of Perſia, or from the domineering ambition of Athens and Sparta.

Having received the ſubmiſſion of Xanthus, Patara, Phaſelis, and above thirty other towns or ſea-ports in Lycia, Alexander, probably for the ſake of greater expedition, divided the corps under his immediate command. A conſiderable detachment traverſed the Lycian and Pamphylian mountains, while the king in perſon purſued the more dangerous track, leading along the ſea-coaſt from Phaſelis to Perga. Here Alexander was met by ambaſſadors from Aſpendus, the principal city and ſea-port of Pamphylia. The Aſpendians offered to ſurrender their city, but entreated that they might not be burdened with a garriſon. Alexander granted their requeſt, on condition of their raiſing fifty talents to pay his ſoldiers, and delivering to him the horſes which they reared as a tribute for Darius. The ambaſſadors accepted theſe terms; but their countrymen diſcovered no inclination to fulfil them. Alexander was informed of their treachery while he lay before Syllius, another ſtrong-hold of Pamphylia. He immediately marched towards Aſpendus, which was ſituate on a ſteep rock, waſhed by the Eurymedon. Several ſtreets, however, were built on the plain, ſurrounded only by a ſlight wall. At the approach of the Greeks, the inhabitants of the lower town aſcended the mountain. Alexander entered the place, and encamped within the walls. The Aſpendians, alarmed by the apprehenſion of a ſiege, intreated him to accept the former conditions. He commanded them to deliver the horſes, as agreed on; to pay, inſtead of fifty, an hundred talents; and to ſurrender their principal citizens, as ſecurities that they would thenceforth obey the governor ſet over them, and pay an annual tribute to Macedon.

After chaſtiſing the treachery of Aſpendus, Alexander determined to march into Phrygia, to join forces with Parmenio. New levies from Greece and Macedon were likewiſe ordered to aſſemble in that province; from which it was intended, early in the ſpring, to proceed eaſtward, and atchieve ſtill more important conqueſts. To reach the ſouthern frontier of Phrygia, Alexander was under a neceſſity of traverſing the inhoſpitable mountains of the warlike Piſidians. Amidſt thoſe rocks and faſtneſſes the Macedonians loſt ſeveral brave men; but the fury of the Piſidians was unable to check the progreſs of Alexander. The city of Gordium in Phrygia was appointed for the general rendezvous. This place is diſtant about ſeventy-five miles from the Euxine, and was famous, in remote antiquity, as the principal reſidence of the Phrygian kings, and the chief ſeat of their opulence and grandeur. Alexander had not long arrived in that place, when a deſire ſeized him of aſcending to the ancient palace of Gordius, to inſpect the famous knot on his chariot, which was believed to involve the fate of Aſia. See the article GORDIUS, p. 691 of this volume. Whether Alexander untied or cut the knot, is left uncertain by hiſtorians; but all agree that his army followed him with complete conviction that he had fulfilled the oracle.

The rapid progreſs of Alexander, and his continual exertions during that ſeaſon of the year when armies are little accuſtomed to keep the field, tends to heighten our ſurpriſe at the inactivity of Darius, who had long ſignaliſed his valour againſt the fierceſt nations of Aſia. But Darius, inſtead of oppoſing the invader in the field, hoped to deſtroy him by the arm of an aſſaſſin. Many traitors were ſuborned for this purpoſe, but none with greater proſpect of ſucceſs than Alexander, the ſon of Æropus. Yet this man had owed his life to the clemency of the ſon of Philip, when his brothers Heromenes and Arrabæus were condemned as acceſſary to the murder of that prince. He was numbered among the companions of Alexander, and had recently been entruſted with the command of the Theſſalian cavalry. The promiſe of ten thouſand talents, and of the kingdom of Macedon, obliterated his gratitude, and ſeduced his allegiance. But his treaſon eſcaped not the vigilance of Parmenio, who communicated the intelligence to his maſter, while encamped in the neighbourhood of Phaſelis. By the ſame faithful miniſter, the unworthy ſon of Æropus was ſeized, and committed to ſafe cuſtody.

Darius had now recourſe to arms; and his troops were aſſembled in the plains of Babylon. They conſiſted of an hundred thouſand Perſians, of whom thirty thouſand were cavalry. The Medes ſupplied almoſt half that number, and the Armenians almoſt as many as the Medes. The Barcani, the Hyrcanians, the inhabitants of the Caſpian ſhores, and nations more obſcure or more remote, ſent their due proportion of cavalry and infantry for this immenſe army, which, including thirty thouſand Greek mercenaries in the Perſian ſervice, is ſaid to have amounted to ſix hundred thouſand men. The magnificence of the Perſians had not diminiſhed ſince the days of Xerxes; neither had their military knowledge increaſed. Their muſter was taken by the ſame contrivance employed by that monarch. Ten thouſand men were ſeparated from the reſt, formed into a compact body, and ſurrounded by a paliſade. The whole army, paſſing ſucceſſively into this incloſure, were rather meaſured, than numbered, by their generals. Nothing could exceed the ſplendour that ſurrounded Darius; the trappings of his horſes, the rich materials and nice adjuſtment of his chariot, the profuſion of jewels which covered his royal mantle, veſt, and tiara. The dreſs, and even the armour, of his guards, were adorned with gold, ſilver, and precious ſtones. He was attended by his family, his treaſures, and his concubines, all eſcorted by numerous bands of horſe and foot.

While this army ſlowly advanced towards Lower Aſia, Alexander left Gordium, and marched to Ancyra, a city of Galatia. In that place he received an embaſſy from the Paphlagonians, who ſurrendered to him the ſovereignty of their province, but intreated that his army might not enter their borders. He granted their requeſt, and commanded them to obey Calas, ſatrap of Phrygia. Alexander then marched through Cappadocia; and Sabictas being appointed to the adminiſtration of that extenſive province, the army encamped at the diſtance of ſix miles from the Cilician frontier, at a place which, ſince the memorable expedition performed by Xenophon, retained the name of Cyrus's Camp. As Alexander advanced, the barbarians haſtily fled; and the puſillanimous Arſames, to whom the whole province was entruſted by Darius, prepared to plunder, and then abandon, his own capital of Tarſus. But he had only time to ſave his perſon. The rapidity of Alexander prevented the deſtruction of that city, where the inhabitants received him as their deliverer. Here Alexander was detained by a malady occaſioned by imprudently

prudently bathing, when heated, in the cold waters of the Cydnus, which flows through the city. Philip the Acarnanian was the only perſon who deſpaired not of his life. While this ſkilful phyſician adminiſtered a draught to his royal patient, a letter came from Parmenio, warning Alexander to beware of Philip, who had been bribed by Darius to poiſon him. Alexander took the potion, and gave Philip the letter; ſo that the phyſician read, while the king drank; a tranſaction which proved either his contempt of death, or his unſhaken confidence in his friends; but which, by the admiration of his contemporaries and poſterity, has been conſtrued into a proof of both. The ſickneſs of Alexander, however, interrupted not the operations of the army. Parmenio was diſpatched to ſeize the only paſs on mount Amanus, which divides Cilicia from Aſſyria. The king ſoon followed, having in one day's march reached Anchialos, an ancient city of vaſt extent, and ſurrounded with walls of prodigious thickneſs. The greateſt curioſity of Anchialos was the tomb of Sardanapalus, diſtinguiſhed by the ſtatue of that effeminate tyrant, in the attitude of clapping his hands; with the following inſcription: "Sardanapalus, ſon of Anacyndaraxas, built Anchialos and Tarſus in one day. As to you, ſtranger! eat, drink, and ſport, for other human things are not worth *this*;" alluding to the clap of his hands.

Having arrived at Mallos, an Argive colony at the eaſtern extremity of Cilicia, Alexander learned that Darius lay with his army in the extenſive plain of Sochos, diſtant only two days march from the Cilician frontier. The hoſtile armies were ſeparated by the mountains which divide Cilicia and Syria. Alexander haſtened to paſs the ſtraits called the Syrian Gates, proceeding ſouthwards along the bay of Iſſus, and encamped before the city Mariandrus. His delay in Cilicia, which had been occaſioned by ſickneſs, and by other unforeſeen events, was aſcribed to very different motives by Darius and his flatterers. That perfidious race, the eternal bane of kings, eaſily perſuaded the Perſian monarch that Alexander dreaded his approach. The haughty Darius was elated at the imagined fears of his adverſary; with impatience he longed to come to action; and not ſuſpecting that Alexander would traverſe the Syrian Gates, he haſtily determined to paſs the ſtraits of Amanus, in a different direction, in queſt of Alexander. This fatal meaſure was carried into inſtant execution, notwithſtanding the repreſentations of Amyntas the Macedonian, and of all Darius's Grecian adherents, who unanimouſly exhorted him to wait the enemy in his preſent advantageous poſition. In the language of antiquity, an irreſiſtible fate, which had determined that the Greeks ſhould conquer the Perſians, as the Perſians had the Medes, and the Medes the Aſſyrians, impelled Darius to his ruin. Having paſſed the defiles of Amanus, he directed his march ſouthward to the bay of Iſſus, and took the city of that name, which contained, under a feeble guard, the ſick and wounded Macedonians, who had not been able to follow the army in its expeditious march acroſs the mountains. The Perſians put theſe unhappy men to death with ſhocking circumſtances of cruelty, little thinking that Alexander was in their rear, preparing to avenge their fate.

That ſagacious prince, who could ſcarcely believe the folly of Darius, ſent a ſwift-ſailing veſſel to reconnoitre his motions. This veſſel ſpeedily returned to Alexander, with the agreeable news that his enemies were now in his hands. Having ſummoned an aſſembly, the king forgot none of thoſe topics of encouragement which the occaſion ſo naturally ſuggeſted, ſince the meaneſt Macedonian ſoldier could diſcern the injudicious movements of the Perſians, who had quitted a ſpacious plain, to entangle themſelves among intricate mountains, where their numerous cavalry, in which they chiefly excelled, could perform no eſſential ſervice. In preparing his troops for this important conteſt, Alexander commanded them firſt to refreſh their bodies; and immediately diſpatched ſome horſe and archers to clear the road to Iſſus. In the evening he followed with his whole army, and about midnight took poſſeſſion of the Syrian ſtraits. The ſoldiers were then allowed a ſhort repoſe, ſufficient guards being poſted on the ſurrounding eminences. At dawn of day the army was in motion, marching by its flank while the paſſage continued narrow; and new columns being ſucceſſively brought up, as the mountains gradually opened. Before reaching the river Pinarus, on the oppoſite bank of which the enemy were encamped, the Macedonians had formed in order of battle; Alexander leading the right wing, the left being committed to Parmenio. They continued to advance, till their right was flanked by a mountain, and their left by the ſea, from which Parmenio was ordered not to recede. Darius, being appriſed of the enemy's approach, detached a body of fifty thouſand cavalry and light infantry acroſs the Pinarus, that the remainder might have room to form without confuſion. His Greek mercenaries, amounting to thirty thouſand, he poſted directly oppoſite to the Macedonian phalanx; and theſe were flanked on both ſides by double that number of barbarians, alſo heavy armed. The nature of the ground admitted not more troops to be ranged in front; but as the mountain on Alexander's left ſloped inwards, Darius placed on that ſinuoſity twenty thouſand men, who could ſee the enemy's rear, though it appears not that they could approach or annoy it. Behind the firſt line the reſt of the barbarians were ranged, according to their various nations, in cloſe but unſerviceable ranks; Darius being every-where encumbered by the vaſtneſs of an army which he had not ſkill to direct.

When Darius perceived the Macedonians advancing, he commanded his men to maintain their poſt on the Pinarus, the bank of which was in ſome places high and ſteep; where the acceſs ſeemed eaſier, he gave orders to raiſe a rampart; precautions which ſhewed the enemy, that even before the battle began, the mind of the Perſian king was already conquered. Alexander, meanwhile, rode along the ranks, exhorting, by name, not only the commanders of the ſeveral brigades, but the tribunes and inferior officers, and even ſuch captains of the auxiliaries as were diſtinguiſhed by rank, or ennobled by merit. Perceiving it neceſſary to moderate the martial ardour that prevailed, he commanded his forces to advance with a regular and ſlow ſtep, leſt the phalanx ſhould fluctuate through too eager a contention. Their motion quickened when they proceeded within reach of the enemy's darts. Alexander, with thoſe around him, then ſprung into the river. Their impetuoſity aſtoniſhed the barbarians, who ſcarcely waited the firſt ſhock. But the Greek mercenaries perceiving that by the rapidity and ſucceſs of Alexander's aſſault, the Macedonians were bent towards the right wing, which was ſeparated from the centre, they ſeized the deciſive moment of ruſhing into the interval, where the phalanx was disjointed. A fierce engagement enſued; the Greeks eager to regain the honour of their name, the Macedonians ambitious to maintain the unſullied glory of the phalanx. This deſperate action proved fatal to Ptolemy the ſon of Seleucus, and other officers of diſtinction, to the number of an hundred and twenty. Meanwhile the Macedonian right wing, having repelled the enemy with great ſlaughter, wheeled to the left, and, animated by recent victory, finally prevailed againſt the Greek mercenaries. A body of Perſian horſe ſtill maintained the battle againſt the Theſſalian cavalry, and did not quit the field, till informed that Darius had betaken himſelf to flight.

The overthrow of the Perſians was now manifeſt on all ſides. Their cavalry and infantry ſuffered equally in the rout; for their horſemen were heavy-armed, and encumbered

encumbered by the narrowneſs of the roads, and their own terror. Ptolemy, the ſon of Lagus, ſays, that the purſuers filled up the ditches with dead bodies. The number of the ſlain was computed at an hundred and ten thouſand, among whom were many ſatraps and nobles. The great king himſelf diſcovered little magnanimity in defending the important objects at ſtake. His left wing was no ſooner repelled by Alexander, than he drove away in his chariot, accompanied by his courtiers. When the road grew rough and mountainous, he continued his flight on horſeback, leaving his ſhield, his mantle, and his bow, which were found by the Macedonians. Alexander, who had received a dangerous wound on the thigh, judged it improper to purſue him, till the Greek mercenaries were diſperſed, and hence the approach of night facilitated his eſcape. This memorable battle took place in the year before Chriſt 333.

The Perſian camp afforded abundant proof of Aſiatic luxury and opulence. It contained however in money but three thouſand talents; the magnificent treaſures, which accompanied the great king, being depoſited, previous to the battle, in the neighbouring city of Damaſcus. This ineſtimable booty was afterwards ſeized by order of Alexander, who found in the camp a booty more precious, the wife and daughters of Darius, his mother Syſigambis, and his infant ſon. In an age when priſoners of war were ſynonymous with ſlaves, Alexander behaved to his royal captives with the tenderneſs of a parent, blended with the reſpect of a ſon. In his chaſte attention to Statira, the faireſt beauty of the eaſt, his conduct forms a remarkable contraſt with that of Achilles, whom he equalled in valour, but far ſurpaſſed in humanity. Theſe illuſtrious princeſſes bore their own misfortunes with patience, but burſt into dreadful lamentations, when informed by an eunuch that he had ſeen the mantle of Darius in the hands of a Macedonian ſoldier. Alexander ſent to aſſure them that Darius yet lived; and next day viſited them in perſon, accompanied by Hepheſtion, the moſt affectionate of his friends. Syſigambis approached to proſtrate herſelf before the conqueror; but not knowing the king, as their dreſs was alike, ſhe turned to Hepheſtion. Hepheſtion ſuddenly ſtepping back, Syſigambis ſaw her miſtake, and was covered with confuſion. "You miſtook not, madam, (ſaid the king,) Hepheſtion is likewiſe Alexander."

The virtues of Alexander long continued to expand with his proſperity; but he was never more inimitably great, than after the battle of Iſſus. The city of Soli, in Cilicia, though inhabited by a Grecian colony, had diſcovered uncommon zeal in the cauſe of Darius. To puniſh this unnatural apoſtacy, Alexander demanded a heavy contribution from Soli; but, after the victory, he remitted this fine. Impelled by the ſame generous ſpirit, he releaſed the Athenian captives taken at the battle of the Granicus; a favour which he had ſternly refuſed at the opening of the campaign. In Damaſcus, ſeveral Grecian ambaſſadors were found among the captives. Alexander ordered them to be brought into his preſence. Theſſaliſcus and Dionyſodorus, the Thebans, he inſtantly declared free, obſerving, that the misfortunes of their country juſtly entitled them to apply to Darius, and to every prince from whom they might hope for relief. Iphicrates, the Athenian, he treated with the reſpect which appeared due both to his country and to his father. Euthycles, the Spartan, alone, he detained in cuſtody, becauſe Sparta ſullenly rejected the friendſhip of Macedon. But as his forgiveneſs ſtill increaſed with his power, he afterwards liberated Euthycles, with a princely condeſcenſion.

Darius, in his flight, was gradually joined by about four thouſand men, chiefly Greeks. Under this eſcort he departed haſtily from Sochos, purſued his march eaſtward, and croſſed the Euphrates at Thapſachus, eager to interpoſe that rapid ſtream between himſelf and the conqueror. Alexander's inclination to ſeize the perſon of his adverſary could not divert him from the judicious plan of war to which he immoveably adhered. In a council of his generals, he declared his opinion, that it would be highly imprudent to attempt the conqueſt of Babylon, until he had thoroughly ſubdued the maritime provinces; becauſe, ſhould he be carried with an unſeaſonable celerity into Upper Aſia, while the enemy commanded the ſea, the war might be removed to Europe, where the Lacedæmonians were open enemies, and the Athenians doubtful friends. Having therefore appointed governors of Cilicia and Cœlo-Syria, he directed his march ſouthward along the Phœnician coaſt. Aradus, Marathus, and Sidon, readily opened their gates. The Tyrians ſent a ſubmiſſive embaſſy of their moſt illuſtrious citizens, among whom was the ſon of Azelmicus, their king, who had himſelf embarked with Autophradates in the Perſian fleet. They humbly informed Alexander, that the community from which they came, was prepared to obey his commands. Having complimented the city and the ambaſſadors, he deſired them to acquaint their countrymen, that he intended ſhortly to enter Tyre, and to perform ſacrifice there to Hercules. Upon this intelligence, the Tyrians diſcovered equal firmneſs and reſolution. A ſecond embaſſy aſſured Alexander of their unalterable reſpect, but at the ſame time communicated to him their determination, that neither the Perſians nor the Macedonians ſhould ever enter their walls. This magnanimity appears remarkable in a nation of merchants, long unaccuſtomed to war. But the reſources of their wealth and commerce ſeemed to have elevated the courage, inſtead of ſoftening the character, of the Tyrians. Their city, which, in the language of the eaſt, was ſtyled the eldeſt daughter of Sidon, had long reigned queen of the ſea. It was ſeparated from the continent by a frith half a mile broad; its walls exceeded an hundred feet in height, and extended eighteen miles in circumference. The convenience of its ſituation, the capaciouſneſs of its harbour, and the ingenuity of its inhabitants, rendered it the commercial capital of the world.

Notwithſtanding the ſtrength of the city, Alexander determined on the ſiege of Tyre. The firſt operation which he directed, was to run a mole from the continent to the walls of that city, where the ſea was about three fathoms deep. The neceſſity of this meaſure aroſe from the imperfection of the battering engines of antiquity, which had little power, except at ſmall diſtances. On the ſide of the continent, the work was carried on with great alacrity; while the combined fleets effectually co-operated by ſea. The iſſue of theſe operations, in the year before Chriſt 332, decided the fate of Tyre. Amidſt repeated aſſaults, the beſiegers diſplayed the ardour of enthuſiaſm, the beſieged the fury of deſpair. From wooden towers, erected equal in height to the walls, the Greeks and Macedonians fought hand to hand with the enemy. By throwing ſpontoons acroſs, the braveſt ſometimes paſſed over, even to the battlements. In other parts, the Tyrians ſucceſsfully employed hooks and grappling-irons to remove the aſſailants. On thoſe who attempted ſcaling-ladders, they poured veſſels of burning ſand, which penetrated to the bone. The vigour of the attack was oppoſed by as vigorous a reſiſtance. The ſhock of the battering engines was deadened by green hides and coverlets of wool, and whenever an opening was effected, the braveſt combatants advanced to defend the breach. But time and fatigue, which exhauſted the vigour of the enemy, only confirmed the perſeverance of Alexander. While the engines aſſailed the walls, the fleet, divided into two ſquadrons, attacked the oppoſite harbours. A wide breach being effected, Alexander commanded the hulks, which carried the engines, to retire, and others, bearing the ſcaling-ladders, to advance, that his ſoldiers might enter the town over the ruins.

The

The targeteers, headed by Admetus, firſt mounted the breach. This gallant commander was ſlain by a ſpear; but Alexander, who was preſent wherever danger called, immediately followed with the royal band of *Companions*. After their walls were taken, the townſmen ſtill rallied, and prepared for defence. The length of the ſiege, and ſtill more the cruelty of the Tyrians, who, having taken ſome Grecian veſſels from Sidon, butchered their crews on the top of their wall, and threw their bodies into the ſea, in ſight of the whole Macedonian army, provoked the indignation of Alexander, and exaſperated the fury of the ſoldiers. Eight thouſand Tyrians were ſlain; thirty thouſand were reduced to ſervitude. The principal magiſtrates, together with ſome Carthaginians who had come to worſhip the gods of their mother-country, took refuge in the temple of Tyrian Hercules. They were ſaved by the clemency of Alexander, who had loſt four hundred men in this memorable ſiege of ſeven months.

The conqueſt of Phœnicia was followed by the ſubmiſſion of the neighbouring province of Judæa. But in the road leading to Egypt, the progreſs of the conqueror was interrupted by the ſtrong city of Gaza, ſituate on a high hill, near the confines of the Arabian deſert. This place was held for Darius by the loyalty of Batis, an eunuch, who had prepared to reſiſt Alexander by hiring Arabian troops, and by providing copious magazines. The Macedonian engineers declared their opinion that Gaza was impregnable. But Alexander, unwilling to incur the diſgrace and danger of leaving a ſtrong fortreſs in his rear, commanded a rampart to be raiſed on the ſouth ſide of the wall, which ſeemed leaſt ſecure againſt an attack. His engines were ſcarcely erected, when the garriſon made a furious ſally, and ſet them on-fire. It required the preſence of the king to ſave the rampart, and to prevent the total defeat of the Macedonians. A wall of incredible height and breadth was run entirely round the city; the Macedonians raiſed their batteries; the miners were buſy at the foundation; breaches were effected; and, after repeated aſſaults, the city was taken by ſtorm. When their wall was undermined, and their gates in poſſeſſion of the enemy, the inhabitants ſtill fought deſperately, and, without loſing ground, periſhed to a man. Their wives and children were enſlaved; and Gaza, being repeopled from the neighbouring territory, ſerved as a place of arms to reſtrain the incurſions of the Arabs.

The obſtinate reſiſtance of Gaza, was balanced by the ready ſubmiſſion of Egypt. In ſeven days march, Alexander reached the maritime city of Peluſium, to which he had previouſly ſent the fleet, with an injunction carefully to examine the neighbouring coaſts, lakes, and rivers. His deciſive victory at Iſſus, the ſhameful flight of Darius, the recent ſubjugation of Syria and Phœnicia, together with the defenceleſs ſtate of Egypt, opened a ready paſſage to the wealthy capital of Memphis. There Alexander was received as ſovereign, and immediately afterwards acknowledged by the whole nation. Having placed ſufficient garriſons both in Memphis and Peluſium, he embarked his forces, and ſailed down the Nile to Canopus. Here he found abundant occupation for his policy, in a country where there was no opportunity for exerciſing his valour. The inſpection of the Mediterranean coaſt, of the Red Sea, of the Lake Marœotis, and of the various branches of the Nile, ſuggeſted the deſign of founding a city, which ſhould derive, from nature only, more permanent advantages than the favour of the greateſt princes can beſtow. Prompted by this idea, he not only fixed the ſituation, but traced the plan, of his intended capital, deſcribed the circuit of its walls, and aſſigned the ground for its ſquares, market-places, and temples. Such was the ſagacity of his choice, that within the ſpace of twenty years, Alexandria roſe to diſtinguiſhed eminence among the cities of the eaſt, and continued, through all ſubſequent ages of antiquity, the ſeat of correſpondence and commerce among the civilized nations of the earth. Having thus effected his purpoſe, he returned to Memphis, in order finally to ſettle the affairs of Egypt. The inhabitants of that country were reinſtated in the enjoyment of their ancient religion and laws. Two Egyptians were appointed to adminiſter the civil government; but the principal garriſons Alexander prudently entruſted to the command of his moſt confidential friends.

The Macedonians had now extended their arms over Anatolia, Carmania, Syria, and Egypt; countries which anciently formed the ſeat of arts and empire; but which, at preſent, compoſe the ſtrength and centre of the Turkiſh power. But Darius ſtill found reſources in his eaſtern provinces, Schirvan, Gilan, Koroſan, and the wide extent of territory between the Caſpian and the Jaxartes. Not only the ſubjects of the empire, but the independent tribes in thoſe remote regions, which in ancient and modern times have ever been the abode of courage and barbarity, rejoiced in an opportunity to ſignaliſe their reſtleſs valour. At the firſt ſummons they poured down into the fertile plains of Aſſyria, and increaſed the army of Darius far beyond any proportion of force which he had hitherto collected. Meanwhile Alexander, having received conſiderable reinforcements from Greece, Macedon, and Thrace, purſued his journey eaſtward from Phœnicia, paſſed the Euphrates at Thapſacus, boldly ſtemmed the rapid ſtream of the Tigris, and haſtened to meet the enemy in Aſſyria. Darius had pitched his camp on the level banks of the Bumadus, near Gaugamela; but the famous battle, which finally decided the empire of the eaſt, derived its name from Arbela, a town in the ſame province, ſixty miles diſtant from the former; but better known, and of eaſier pronunciation.

Alexander was informed by deſerters, of the ſtrength and numbers of the Perſian army. Some made it amount to a million of foot, forty thouſand horſe, two hundred armed chariots, and fifteen elephants from the eaſtern banks of the Indus. Others exaggerated with more method and probability, reducing the infantry to ſix hundred thouſand, and raiſing the cavalry to an hundred and forty-five thouſand. But all agreed that the preſent army was more numerous, and compoſed of more warlike nations, than that which had fought at Iſſus. Alexander received this information without teſtifying the ſmalleſt ſurpriſe. Having commanded a halt, he encamped four days, to give his troops reſt and refreſhment. His camp being fortified by a good intrenchment, he left in it the ſick and infirm, together with all the baggage; and, on the evening of the fourth day, he prepared to march againſt the enemy with the effective part of his army, which was ſaid to conſiſt of forty thouſand infantry, and ſeven thouſand horſe. Having aſcended a riſing ground, Alexander firſt beheld the barbarians, drawn up in battle array, and perhaps more ſkilfully marſhalled than he had reaſon to apprehend. Their advantageous appearance determined him to change his firſt reſolution. He ſummoned a council of war, and different meaſures being propoſed, he acceded to the opinion of Parmenio, who adviſed that the foot ſhould remain ſtationary, while a detachment of horſe explored the field of battle, and carefully examined the diſpoſition of the enemy. Alexander, whoſe conduct was equalled by his courage, and both ſurpaſſed by his activity, performed thoſe important duties in perſon, at the head of his royal cohort. Having returned with unexampled celerity, he again aſſembled his captains, and encouraged them by a ſhort ſpeech. Their ardour correſponded with his own; and the ſoldiers, confident of victory, were commanded to take reſt and refreſhment.

Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for battle. Notwithſtanding the great length of the plain, he was obliged to contract

his front, and form in two lines, each of which was extremely deep. According to the Perſian cuſtom, the king occupied the centre of the firſt line, ſurrounded by the princes of the blood, and the great officers of his court, and defended by his horſe and foot guards, amounting to fifteen thouſand choſen men. Theſe ſplendid troops were flanked, on either ſide, by the Greek mercenaries, and other warlike battalions, carefully ſelected from the whole army. The right wing conſiſted of the Medes, Parthians, Hyrcanians, and Sacæ; the left was chiefly occupied by the Bactrians, Perſians, and Carduſians. The various nations compoſing this immenſe hoſt were differently armed, with ſwords, ſpears, clubs, and hatchets; while the horſe and foot of each diviſion were promiſcuouſly blended, rather from the reſult of accident than the ſagacity of deſign. The armed chariots fronted the firſt line, whoſe centre was farther defended by the elephants. Choſen ſquadrons of Scythian, Bactrian, and Cappadocian, cavalry advanced before either wing, prepared to bring on the action, or, after it began, to attack the enemy in flank and rear.

At day-break, Alexander diſpoſed his troops in a manner ſuggeſted by the ſuperior numbers and order of the enemy. His main body conſiſted of two heavy-armed phalanxes, each amounting to above ſixteen thouſand men. Of theſe, the greater part formed into one line; behind which, he placed the heavy-armed men, reinforced by his targeteers, with orders, that when the out-ſpreading wings of the enemy prepared to attack the flanks and rear of his firſt line, the ſecond ſhould immediately wheel to receive them. The cavalry and light infantry were ſo diſpoſed on the wings, that while one part reſiſted the ſhock of the Perſians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were poſted at proper intervals, as affording the beſt defence againſt the armed chariots. Alexander, with equal judgment, led the whole in an oblique direction towards the enemy's left; a manœuvre which enabled the Macedonians to avoid contending at once with ſuperior numbers. When his advanced battalions, notwithſtanding their nearneſs to the enemy, ſtill ſtretched towards the right, Darius alſo extended his left, till, fearing that by continuing this movement his men ſhould be drawn gradually off the plain, he commanded the Scythian ſquadrons to advance, and prevent the further extenſion of the Macedonian line. Alexander immediately detached a body of horſe to oppoſe them. An equeſtrian combat enſued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then iſſued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their aſſault harmleſs. Darius next moved his main body, but with ſo little order, that the horſe, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to ſupply. Alexander ſeized the favourable moment, and penetrated into the void with a wedge of ſquadrons. He was followed by the neareſt ſections of the phalanx, who ruſhed forward with loud ſhouts, as if they had already purſued the enemy. In this part of the field, the victory was not long doubtful; after a feeble reſiſtance, the barbarians gave way; and the Perſian king was foremoſt in the flight. The battle, however, was far from being decided. The more remote diviſions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant ſpace was thus left in the Macedonian line, through which ſome ſquadrons of Perſian and Indian horſe penetrated with celerity, and advanced to the hoſtile camp. It was then that Alexander derived ſignal advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had ſkilfully poſted behind the phalanx, ſpeedily faced about, advanced with a rapid ſtep, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus ſurpriſed, were ſoon deſtroyed, or put to flight. Meanwhile, the danger of his left wing recalled Alexander from the purſuit of Darius. In advancing againſt the enemy's right, he was met by the Parthian, Indian, and Perſian, horſe, who maintained a ſharp conflict. Sixty of the *Companions* fell; Hephæſtion, Cœnus, and Menidas, were wounded. Having at length diſſipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the buſineſs was already effected, chiefly by the Theſſalian horſe; and nothing remained but to purſue the fugitives, and to render the victory as deciſive as poſſible.

According to the leaſt extravagant accounts, with the loſs of five hundred men Alexander deſtroyed forty thouſand of the barbarians, who never thenceforth aſſembled in ſufficient numbers to diſpute his dominion in the eaſt. The invaluable provinces of Babylonia, Suſiana, and Perſis, with their reſpective capitals of Babylon, Suſa, and Perſepolis, formed the prize of his ſkill and valour. Alexander had not yet attained the ſummit of his fortune, though he had reached the height of his renown. The burning of the royal palace of Perſepolis, to retaliate the ravages of Xerxes in Greece, afforded the firſt indication of his being overcome by too much proſperity. To ſpeak the moſt favourably of this tranſaction, an undiſtinguiſhing reſentment made him forget that he deſtroyed his own palace, not that of his adverſary.

Darius, after his defeat, eſcaped by a precipitate flight acroſs the Armenian mountains into Media. Being gradually joined by the ſcattered remnant of his army, amounting to ſeveral thouſand barbarians, and fifteen hundred Greek mercenaries, he purpoſed to have eſtabliſhed his court in Media, ſhould Alexander remain at Suſa or Babylon; but in caſe he were ſtill purſued by the conqueror, his reſolution was to proceed eaſtward, through Parthia and Hyrcania, into the valuable province of Bactria, laying waſte the intermediate country, that he might thus interpoſe a deſert between himſelf and the Macedonians. With this deſign he diſpatched to the Caſpian Gates the waggons conveying his women, and ſuch inſtruments of convenience or luxury as ſtill ſoftened his misfortunes; while he remained in perſon at Ecbatana with his army. Alexander, when appriſed of theſe meaſures, haſtened into Media. In his way he ſubdued the Paritacæ; and having reached within three days' march of the Median capital, was met by Biſthanes, the ſon of Ochus, Darius's predeceſſor. This prince informed him, that Darius had fled from thence five days before, attended by three thouſand horſemen and ſix thouſand foot. Animated by this intelligence, Alexander proceeded to Ecbatana, in which place he left his treaſures, and poſted a ſtrong garriſon. A detachment under Parmenio was ſent into Hyrcania; Cœnus, who had been left ſick at Suſa, was commanded to march with all convenient ſpeed into Parthia; while the king, with a choſen army, advanced in purſuit of Darius. Having paſſed the Caſpian Straits, he learned that Darius, being ſeized and bound, was carried priſoner in his chariot; that Beſſus, governor of Bactria, in whoſe province this treaſon had been committed, had aſſumed the imperial honours; and that all the barbarians (Artabazus only and his ſons excepted) already acknowledged the uſurper. Alexander further learned, that ſhould he purſue Beſſus and his aſſociates, it was their intention to make peace with him by delivering up Darius; but ſhould he ceaſe from the purſuit, that they had determined to collect forces, and to divide the eaſtern provinces of the empire.

After this information, Alexander marched all night, and next day till noon, without overtaking the enemy.

He therefore diſmounted five hundred of his cavalry; placed the braveſt of his foot, completely armed, on horſeback; and, commanding Attalus and Nicanor to purſue the great road which Beſſus had followed, he advanced in perſon with his choſen band by a nearer way. From the cloſe of the evening till day-break he had rode near fifty miles, when he firſt diſcovered the enemy flying in diſorder, and unarmed. Probably to facilitate their own eſcape, the ſatraps Satibarzanes and Barzaentes ſtabbed Darius, and then rode away with Beſſus, accompanied by ſix hundred horſe. Notwithſtanding the celerity of Alexander, the unhappy Darius expired, in the year before Chriſt 330, before the conqueror beheld him. Darius was the laſt king of the houſe of Hyſtaſpes, and the tenth in ſucceſſion to the monarchy of Cyrus. In this arduous criſis, Alexander diſplayed tender ſympathy with affliction, and juſt hatred of treaſon. He gave orders, that the body of Darius ſhould be removed with every mark of reſpect to Perſia, and ſolemnly interred in the royal mauſoleum. The children of the deceaſed prince were treated with thoſe diſtinctions which belonged to their birth; and Barcinè, his eldeſt daughter, was finally eſpouſed by Alexander. The pardon of the Greek mercenaries, who were admitted into the Macedonian ſervice, and the honourable reception of Artabazus and his ſons, well became the character of a prince, who could diſcern and reward the merit of his enemies. Alexander then purſued the murderers of Darius through the inhoſpitable territories of the Arii and Zarangæi. Having received the ſubmiſſion of Aornos and Bactria, he paſſed the rapid Oxus, and learned, on the eaſtern banks of this river, that Beſſus, who had betrayed his maſter, had been betrayed in his turn by Spitamenes. The former was ſurpriſed by the Macedonians, and treated with a barbarity better merited by his own crimes, than becoming the character of Alexander.

Spitamenes ſucceeded to his ambition and danger. In purſuit of this daring rebel, the reſentment of Alexander hurried him through the vaſt provinces of Aria, Bactria, Sogdiana, and other conſiderable diviſions of the ſouthern region of Tartary. The more northern and independent tribes of that immenſe country, whoſe paſtoral life formed an admirable preparation for war, ventured to take arms againſt a conqueror who hovered on the frontier of their plains, and whoſe camp tempted them with the proſpect of a rich plunder. This was called the Bactrian and Scythian war, which commenced in the year before Chriſt 329. The policy of Spitamenes inflamed their courage, and animated their hopes. Theſe rude nations, and this obſcure leader, proved the moſt dangerous enemies with whom Alexander had to contend. Sometimes they faced him in the field, and after obſtinately reſiſting, retreated ſkilfully. Though never vanquiſhed, Alexander obtained many dear-bought victories. The Scythians, on ſeveral occaſions, ſurpriſed his advanced parties, and interrupted his convoys. The abruptneſs of their attack was only equalled by the celerity of their retreat; their numbers, their courage, and their ſtratagems, all rendered them formidable. But the enlightened intrepidity, and inimitable diſcipline, of the Greeks and Macedonians, finally prevailed over barbarian craft and deſultory fury. Not content with repelling theſe ſavage foes, Alexander croſſed the Jaxartes, and defeated the Scythians on the northern bank of that river. This victory was ſufficient for his renown; and the urgency of his affairs ſoon recalled him from that inhoſpitable country. The provinces between the Caſpian and Jaxartes twice rebelled, and were twice reduced to ſubmiſſion. The barbarians fighting ſingly were ſucceſſively ſubdued; their braveſt troops were gradually intermixed in the Macedonian ranks; and Alexander, thus continually reinforced by new numbers, was enabled to overawe thoſe extenſive countries, by dividing his army into five formidable brigades, commanded by Hephæſtion, Ptolemy, Perdiccas, Cænus, and himſelf. Near Gabæ, a fortreſs of Sogdiana, Cænus attacked and defeated Spitamenes. The Sogdians and Bactrians deſerted their unfortunate general, and ſurrendered their arms to the conqueror. The Maſſagetæ and other Scythians, having plundered the camp of their allies, fled with Spitamenes to the deſert; but being appriſed that the Macedonians prepared to purſue them, they ſlew this active and daring chief, whoſe courage deſerved a better fate; and in hopes of making their own peace, ſent his head to the conqueror.

After the death of Spitamenes, in the year before Chriſt 327, the enemy feebly reſiſted Alexander in the open country; but in the provinces of Sogdiana and Parætacene, two fortreſſes long deemed impregnable, ſtill bade defiance to the invader. Into the former, Oxyartes the Bactrian had placed his wife and children. The rock was ſteep, rugged, and inacceſſible, and provided with corn for a long ſiege. The deep ſnow, by which it was ſurrounded, increaſed the difficulty of aſſaulting it, and ſupplied the garriſon with water. Alexander, upon ſummoning the Bactrians to ſurrender, was aſked in deriſion, Whether he had furniſhed himſelf with winged ſoldiers? This inſolence piqued his pride; and he determined to make himſelf maſter of the fortreſs, with whatever difficulties and dangers his undertaking might be attended. He propoſed a reward of twelve talents to the man who ſhould firſt mount the top of the rock on which it was ſituated. The ſecond and third were to be proportionably rewarded, and even the laſt of ten was to be gratified with the ſum of three hundred darics. The hopes of this recompence ſtimulated the moſt daring and ingenious. Three hundred volunteers ſoon offered, who were furniſhed with ropes made of the ſtrongeſt flax, and with iron pins uſed in pitching tents. They were likewiſe provided with ſmall pieces of linen, which, being joined together, might ſerve as a ſignal. Thus equipped, they proceeded at the cloſe of evening towards the moſt abrupt ſide of the rock, and therefore the moſt likely to be unguarded. By driving the iron pins into congealed ſnow, and then faſtening to them the ropes, they gradually hoiſted themſelves up the mountain. By this ſimple contrivance, thoſe daring adventurers gained the ſummit of the rock, which overlooked the fortreſs; and waving their ſignal in the morning, were diſcovered by Alexander. At this joyous ſight, he ſummoned the beſieged to ſurrender to his winged ſoldiers. The barbarians beheld and trembled; terror multiplied the number of their enemies; and Alexander was invited to take poſſeſſion of the fortreſs. This ſtrong and hitherto unconquerable caſtle contained Roxana, daughter of Oxyartes, who was deemed, next to the ſpouſe of Darius, the greateſt beauty in the eaſt. Alexander was captivated by her form and her accompliſhments; but even in the fervour of youth, and the intoxication of proſperity, his generous mind diſdained the cruel rights of a conqueror, as juſtified by the maxims and example of his age and country. With a moderation and ſelf-command, worthy the ſcholar of Ariſtotle, he declined the embraces of his captive, till his condeſcending affection raiſed her to the throne, chooſing rather to offend the prejudices of the Macedonians, than to tranſgreſs the laws of humanity.

In Bactria, Alexander learned that the Parætacæ were in arms, and that many of his moſt dangerous enemies had ſhut themſelves up in the fortreſs of Chorienes. Upon this intelligence, he haſtened to the Parætacene. The height of the rock, which was every-where ſteep and craggy, he found to be near three miles, and its circumference above ſeven. It was ſurrounded by a broad and deep ditch, at ſuch diſtance from the baſe as placed the garriſon beyond the reach of miſſile weapons. Alexander gave orders that the fir-trees, of extraordinary

traordinary height, which ſurrounded the mountain, ſhould be cut down, and formed into ladders, by means of which his men, deſcending the ditch, drove huge piles into the bottom. Theſe, being placed at proper diſtances, were covered with hurdles of ozier conſolidated with earth. In this occupation his whole army were employed by turns, night and day. The barbarians at firſt derided this ſeemingly uſeleſs labour; but the ſpeedy progreſs of the work, and dauntleſs intrepidity of the Macedonians, ſoon wrought upon Chorienes, from whom the fortreſs took its name; and by his timely yet dignified ſubmiſſion, he not only obtained pardon, but gained the friendſhip of Alexander, who again entruſted him with the command of his fortreſs, and the government of his province.

By ſuch memorable atchievements, in the year before Chriſt 327, Alexander had completely ſubdued the nations between the Caſpian ſea, the river Jaxartes, and the lofty chain of mountains, which ſupply the ſources of the Indus and the Ganges. In the conduct of this remote and dangerous war, the great abilities of the general were conſpicuouſly diſtinguiſhed. His example taught the troops to deſpiſe hunger, fatigue, cold, and danger; neither rugged mountains, nor deep and rapid rivers, nor wounds, nor ſickneſs, could interrupt his progreſs, or abate his activity: his courage expoſed him to difficulties, from which he was extricated by new efforts of intrepidity, which in any other commander would have paſſed for temerity. Amidſt the hardſhips of a military life, obſtinate ſieges, bloody battles, and dear-bought victories, he ſtill reſpected the rights of mankind, and practiſed the mild virtues of humanity. The conquered nations enjoyed their ancient laws and privileges; the rigours of deſpotiſm were ſoftened; arts and induſtry encouraged; and the proudeſt Macedonian governors compelled, by the authority and example of Alexander, to obſerve the rules of juſtice towards their meaneſt ſubjects. Thus aroſe good out of the evils of war. To bridle the fierce inhabitants of the Scythian plains, he founded cities and eſtabliſhed colonies on the banks of the Jaxartes and the Oxus; and thoſe deſtructive campaigns, uſually aſcribed to his reſtleſs activity and blind ambition, appeared to the diſcernment of this extraordinary man, not only eſſential to the ſecurity of the conqueſts which he had already made, but neceſſary preparations for more remote and ſplendid expeditions which he ſtill meditated, and which he performed with ſingular boldneſs and unexampled ſucceſs.

During the three firſt years that the invincible heroiſm of Alexander triumphed in the Eaſt, the vigilance of Antipater repreſſed rebellion and ſedition in Greece. The attention of that general being diverted, by a revolt in Thrace, from the affairs of the ſouthern provinces, the Lacedæmonians, inſtigated by the warlike ambition of their king Agis, ventured to exert that hoſtility againſt Macedon which they had long felt and encouraged. Reinforced by ſome communities of the Peloponneſus, the allied army amounted to twenty-two thouſand men. But Antipater, having checked the inſurrection in Thrace, haſtened into the Grecian peninſula with a ſuperior force, and defeated the confederates in a battle, which proved fatal to king Agis and three thouſand Peloponneſian troops. The vanquiſhed were allowed to ſend ambaſſadors to implore the clemency of Alexander. From that generous prince the rebellious republics received promiſe of pardon, on condition that they puniſhed with due ſeverity the authors of ſo unprovoked and ill-judged a revolt. From this period, till the death of Alexander, Greece enjoyed, above eight years, an unuſual degree of tranquillity and happineſs. Many improvements were made in the ſciences; and the Greeks, the Athenians particularly, ſtill rivalled the taſte and genius, though not the ſpirit and virtue, of their anceſtors. Yet even in this degenerate ſtate, when their patriotiſm and valour were extinct, and thoſe vanquiſhed republicans had neither liberties to love, nor country to defend, their martial honours were revived and brightened by an aſſociation with the renown of their conqueror. Under Alexander, their exploits, though directed to very different purpoſes, equalled, perhaps excelled, the boaſted trophies of Marathon and Platæa. By a ſingularity peculiar to their fortune, the æra of their political diſgrace coincides with the moſt ſplendid period of their military glory. Alexander was himſelf a Greek; his kingdom had been founded by a Grecian colony; and, to revenge the wrongs of his nation, he was now accompliſhing the moſt extraordinary enterpriſes recorded in the hiſtory of the world.

Without allowing his troops to become enervated by indulgence or diſſipation, the conqueror immediately prepared for his Indian expedition; in which enterpriſe he embarked early in the ſpring; Amyntas being appointed governor of Bactria, and entruſted with an army ſufficient to overawe the ſurrounding provinces. With the remainder of his forces Alexander haſtened ſouthwards, and in ten days traverſed the Paropamiſus, a link of that immenſe chain of mountains reaching from the coaſt of Cilicia to the ſea of China. The ſouthern belt, diſtinguiſhed in different portions of its length by the various names of Taurus, Paropamiſus, Imaus, and Edmodus, the Greeks confounded with the northern chain, of which Scythian Caucaſus is a part, and whoſe remote branches extend from the ſhores of the Euxine to the eaſtern extremity of Tartary. The intermediate ſpace, eſpecially towards the central country of Bukaria, is far more elevated than any other portion of the eaſtern continent; and the towering heights of Paropamiſus had hitherto defended the majeſty of India againſt the ravagers of the earth. But theſe defences were of no avail againſt the proweſs and perſeverance of Alexander. He conducted his army by the route of Candahar, well known to the caravans of Agra and Iſpahan. Having reached the banks of the Cophenes, he divided his forces; the greater part he retained under his own command; the remainder were detached, under Hephæſtion and Perdiccas, to clear the road to the Indus, and to make all neceſſary preparations for croſſing that river. After many ſevere conflicts, he ſubdued the Aſpii, Thryræi, Araſaci, and Aſſaceni; ſcoured the banks of the Choas and Cophenes; expelled the barbarians from their faſtneſſes; and drove them towards the northern mountains, which ſupply the ſources of the Oxus and the Indus.

The Macedonians now proceeded through the country between the Cophenes and the Indus. In this fertile diſtrict, the army, as it advanced towards Mount Meros and the celebrated Nyſa, was met by a deputation from the citizens of that place, which was ſaid to have been founded in the heroic age, by a Grecian colony eſtabliſhed by Bacchus at the eaſtern extremity of his conqueſts. Theſe wandering *Greeks*, might we indulge for a moment the ſuppoſition that the inhabitants of Nyſa were really entitled to that name, appear in this Indian ſoil to have degenerated from the courage, while they preſerved the policy, the eloquence, and the artifices, of their European brethren. Being immediately conducted to Alexander, who had juſt ſat down in his tent, covered with ſweat and duſt, and ſtill armed with his caſque and lance, they teſtified great horror at his aſpect, and threw themſelves proſtrate on the ground. The king having raiſed them from their humble poſture, and addreſſed them with his uſual condeſcenſion, they recovered ſufficient boldneſs to entreat him to ſpare their country for the ſake of Bacchus their founder. In proof of this allegation, they inſiſted on the name of Nyſa, derived from the nurſe of Bacchus, and on the abundance, not only of vines and laurel, but of ivy, which grew in *their* territory, and in no other part of India.

ſia. Alexander, willing to admit a pretenſion, which might atteſt to ſucceeding ages that he had carried his conqueſts ſtill farther than Bacchus, readily granted their requeſt. Having underſtood that Nyſa was governed by an ariſtocracy, he demanded, as hoſtages, an hundred of their principal citizens, and three hundred of their cavalry. This demand excited the ſmile of Acuphis, who headed the embaſſy. Alexander deſired him to explain his ſmile. He replied, "O king! you are welcome to three hundred of our horſemen, and more, ſhould you think proper. But can you believe it poſſible that any city ſhould long continue ſafe, after loſing an hundred of its moſt virtuous citizens? Inſtead of one hundred of the beſt, ſhould you be contented with two hundred of the worſt men in Nyſa, be aſſured that, at your return, you will find this country in as flouriſhing a condition as when you left it." Pleaſed with this remark, Alexander remitted his demand of the magiſtrates; he was accompanied by the cavalry, and by the ſon and nephew of Acuphis, who were ambitious to learn the art of war under ſuch an accompliſhed general. Theſe tranſactions, added to a march of ſixteen days from the Oxus to the Indus, allowed time for Hephæſtion and Perdiccas to make the preparations neceſſary for paſſing the latter river. On the eaſtern bank, Alexander received the ſubmiſſion of the neighbouring princes. Of theſe, Taxiles, who was the moſt conſiderable, brought, beſides other valuable preſents, the aſſiſtance of ſeven thouſand Indian horſe, and ſurrendered his capital, Taxila, the moſt wealthy and populous city between the Indus and Hydaſpes. But the king, who never allowed himſelf to be outdone in generoſity, reſtored and augmented the dominions of Taxiles.

The army croſſed the Indus about the time of the ſummer ſolſtice, at which ſeaſon the Indian rivers are ſwelled by heavy rains, as well as by the melted ſnow, which deſcends in torrents from the heights above. Truſting to this circumſtance, Porus, a powerful warlike prince, had encamped on the Shantrou, or Hydaſpes, with thirty thouſand foot, four thouſand horſe, three hundred armed chariots, and two hundred elephants. At a ſmall diſtance from the main body, his ſon commanded a detachment, conſiſting of the ſame kind of forces, well accoutred, and excellently diſciplined. Alexander perceived the difficulty of paſſing the Hydaſpes in the face of this formidable hoſt; a difficulty which muſt be greatly increaſed by the elephants, whoſe noiſe, and ſmell, and aſpect, were alike terrible to cavalry. He therefore collected proviſions on the oppoſite bank, and gave out that he purpoſed to delay paſſing the river till a more favourable ſeaſon. This artifice deluded not the cunning Indians; and Porus kept his poſt. The king next had recourſe to a different ſtratagem. Having poſted his cavalry in ſeparate detachments along the river, he commanded them to raiſe in the night loud ſhouts of war, and to fill the bank with agitation and tumult, as if they had determined at all hazards to effect their paſſage. The noiſe rouſed the enemy, and Porus conducted his elephants wherever the danger threatened. This ſcene was repeated ſeveral ſucceſſive nights; during which the barbarians were fatigued and haraſſed by the perpetual alarms. Porus now thought that nothing was intended by this vain noiſe, but merely to diſturb his repoſe; he therefore deſiſted from following the motions of the Macedonian cavalry, and remained quiet in his encampment, having ſtationed proper guards on the bank.

The falſe ſecurity of Porus enabled Alexander to effect his purpoſe. At the diſtance of about eighteen miles from his camp, and at the principal winding of the Hydaſpes, there ſtood a lofty rock, thickly covered with trees; and near it an iſland, likewiſe over-run with wood, and uninhabited. Such objects were favourable for concealment; they immediately ſuggeſted to Alexander the deſign of paſſing the river with a ſtrong detachment, which he reſolved to command in perſon, as he ſeldom left to others what he could himſelf perform; and, amidſt the variety of operations, always claimed the taſk of importance or danger. The Macedonian phalanx, the new levies from Paropamiſus, together with the Indian auxiliaries, and one diviſion of the cavalry, remained under the command of Craterus. They had orders to amuſe the enemy by making fires in the night, and by preparing openly during day-time to croſs the Hydaſpes. While theſe operations were carrying on by Craterus, Alexander, having collected hides and boats, marched up the country with a choice body of light infantry, the archers and Agrians, the Bactrian, Scythian, and Parthian, cavalry, together with a due proportion of heavy-armed troops. Having receded from the bank to a diſtance ſufficiently remote for eluding the obſervation of Porus, he advanced towards the rock and iſland; and in this ſecure poſt prepared to embark, after taking ſuch precautions againſt the viciſſitudes of war and fortune, as could be ſuggeſted only by the moſt profound military genius. The orders given to Craterus were preciſe: ſhould the Indians perceive, and endeavour to interrupt, the paſſage to the rock and iſland, he was in that caſe to haſten over with his cavalry; otherwiſe not to ſtir from his poſt, until he obſerved Porus advancing againſt Alexander, or flying from the field. At an equal diſtance between the bank, where Alexander meant to paſs, and the camp where Craterus lay, Attalus and Meleager were poſted with a powerful body of mercenaries, chiefly conſiſting of Indian mountaineers, who had been defeated by the Macedonians, and taken into the pay of the conqueror. To provide for any unforeſeen accident, ſentinels were placed along the bank, at convenient diſtances, to obſerve and repeat ſignals. Fortune favoured theſe judicious diſpoſitions. A violent tempeſt concealed from the enemy's out-guards the tumult of preparation; the claſh of armour and the voice of command being overpowered by the complicated craſh of rain and thunder. When the ſtorm ſomewhat abated, the horſe and infantry, in ſuch proportions as both the boats and hides could convey, paſſed over unperceived into the iſland. Alexander led the line, accompanied in his veſſel of thirty oars by Seleucus, Ptolemy, Perdiccas, and Lyſimachus; names deſtined to fill the ancient world, when their renown was no longer repreſſed by the irreſiſtible diffuſion of their maſter's glory.

The king firſt reached the oppoſite bank, in ſight of the enemy's out-guards, who haſtened to convey the unwelcome intelligence to Porus. The Macedonians meanwhile formed in order of battle; but before meeting their enemies, they had to ſtruggle with an unforeſeen difficulty. The coaſt on which they landed was the ſhore of another iſland, diſjoined from the continent by a river commonly fordable, but actually ſo much ſwelled by the rains of the preceding night, that the water reached the breaſts of the men, and the necks of the horſes. Having paſſed this dangerous ſtream with his cavalry and targeteers, Alexander advanced with all poſſible expedition, conſidering, that ſhould Porus offer battle, theſe forces would reſiſt till joined by the heavy infantry; but ſhould the Indians be ſtruck with panic at his unexpected paſſage of the Hydaſpes, the light-armed troops would thus arrive in time to attack and purſue them with advantage. Upon the firſt alarm, Porus detached his ſon to oppoſe the landing of the enemy, with two thouſand horſe and one hundred and twenty armed chariots. Theſe forces, arriving too late, were ſpeedily broken and put to flight by the equeſtrian archers; their leader and four hundred horſemen were ſlain; moſt of the chariots were taken; the ſlime of the river, which rendered them unſerviceable in the action, likewiſe interrupted their flight.

The news of this diſcomfiture deeply afflicted Porus; but

but his immediate danger allowed not time for reflection. Craterus viſibly prepared to paſs the river, and to attack him in front; his flanks were threatened with the ſhock of the Macedonian horſe, elated by recent victory. In this emergency the Indian king appears to have acted with equal prudence and firmneſs. Unable to oppoſe this complicated aſſault, he left part of the elephants under a ſmall guard, to frighten, rather than reſiſt, Craterus's cavalry; while, at the head of his whole army, he marched in perſon to meet the more formidable diviſion of the enemy, commanded by Alexander himſelf. His horſe amounted to four, and his foot to thirty, thouſand; but the part of his ſtrength in which he ſeemed moſt to confide, conſiſted of three hundred armed chariots, and two hundred elephants. With theſe forces, Porus advanced and halted in a plain ſufficiently dry and firm for his chariots to wheel. He then arranged his elephants at intervals of an hundred feet; in theſe intervals he placed his infantry, a little behind the line. By this order of battle, he expected to intimidate the enemy, ſince their horſe, he thought, would be deterred from advancing at ſight of the elephants; and their infantry, he imagined, would not venture to attack the Indians in front, while they muſt be themſelves expoſed to be attacked in flank, and trampled under foot by thoſe terrible animals. At either extremity of the line, the elephants bore huge wooden towers, filled with armed men. The cavalry formed the wings, covered in front with the armed chariots.

Alexander by this time appeared at the head of the royal cohort and equeſtrian archers. Perceiving that the enemy had already prepared for battle, he commanded a halt, until the heavy-armed troops ſhould join. This being effected, he allowed them time to reſt and recover ſtrength, carefully encircling them with the cavalry; and meanwhile examined, with his uſual diligence, the diſpoſition of the enemy. Upon obſerving their order of battle, he determined not to attack them in front, in order to avoid encountering the difficulties which Porus had artfully thrown in his way; and at once reſolved on an expedient, which, with ſuch troops as thoſe whom he commanded, could ſcarcely fail to prove deciſive. By intricate and ſkilful manœuvres, altogether unintelligible to the Indians, he moved imperceptibly towards their left wing with the flower of his cavalry. The remainder, conducted by Cænus, ſtretched towards the right, having orders to wheel at a given diſtance, that they might attack the Indians in the rear, ſhould they wait to receive the ſhock of Alexander's ſquadrons. A thouſand equeſtrian archers directed their rapid courſe towards the ſame wing; while the Macedonian foot remained firm in their poſts, waiting the event of this complicated aſſault, which appears to have been conducted with the moſt preciſe obſervance of time and diſtance.

The Indian horſe, haraſſed by the equeſtrian archers, and expoſed to the danger of being ſurrounded, were obliged to form into two diviſions, of which one prepared to reſiſt Alexander, and the other faced about to meet Cænus. But this evolution ſo much diſordered their ranks, that they were totally unable to ſtand the ſhock of the Macedonian cavalry, which ſurpaſſed them as much in ſtrength as it excelled them in diſcipline. The fugitives took refuge in the intervals that had been left between the elephants. Theſe fierce animals were then conducted againſt the enemy's horſe; which movement was no ſooner obſerved by the infantry, than they ſeaſonably advanced, and galled the aſſailants with darts and arrows. Wherever the elephants turned, the Macedonians opened their ranks, finding it dangerous to reſiſt them with a cloſe and deep phalanx. Meanwhile, the Indian cavalry rallied, and were repelled with greater loſs than before. They again ſought the ſame friendly retreat; but their flight was now intercepted, and themſelves almoſt entirely ſurrounded, by the Macedonian horſe; at the ſame time that the elephants, having moſtly loſt their riders, became furious through their wounds, and proved more formidable to friends than foes, becauſe the Macedonians, having the advantage of an open ground, could every where give way to their fury. Thus the battle was decided before the diviſion under Craterus had paſſed the river. But the arrival of theſe freſh troops rendered the purſuit peculiarly deſtructive. The unfortunate Porus loſt both his ſons, moſt of his captains, twenty thouſand foot, and three thouſand horſe. The elephants, ſpent with fatigue and loſs of blood, were ſlain or taken; even the armed chariots were hacked in pieces, having proved leſs formidable in reality than appearance, ſince little more than three hundred men periſhed on the ſide of Alexander.

The Indian king, having perſonally behaved with great gallantry in the action, was the laſt to leave the field. His flight being retarded by his wounds, he was overtaken by Taxiles, whom Alexander entruſted with the care of ſeizing him alive. But Porus, perceiving the approach of a man who was his ancient and inveterate enemy, turned his elephant, and prepared to renew the combat. Alexander then diſpatched to him Meroe, an Indian of diſtinction, who, he underſtood, had formerly lived with Porus in habits of friendſhip. By the entreaties of Meroe, the high-minded prince, ſpent with thirſt and fatigue, was admoniſhed to ſurrender; and being ſeaſonably refreſhed, was conducted to the preſence of the conqueror. Alexander admired his ſtature, and the majeſty of his perſon, being more than ſeven feet high; but he admired ſtill more his courage and magnanimity. Having aſked in what he could moſt oblige him? Porus anſwered, "By acting like a king." "That," ſaid Alexander with a ſmile, "I ſhould do for my own ſake; but what can I do for yours?" Porus replied, "All my wiſhes are contained in that one requeſt." None ever admired the virtues of an exalted mind more than Alexander. Struck with the firmneſs of Porus, he declared him reinſtated on his throne; acknowledged him for his ally and his friend; and having ſoon afterwards received the ſubmiſſion of the Glauſæ, who poſſeſſed thirty-ſeven cities on his eaſtern frontier, he added this populous province to the dominions of his new confederate. Immediately after the battle, he interred the ſlain, performed the accuſtomed ſacrifices, and exhibited gymnaſtic and equeſtrian games on the banks of the Hydaſpes. Before leaving that river, he founded the cities of Nicæa and Bucephalia; the former was ſo called to commemorate the victory gained near the place where it ſtood; the latter, ſituate on the oppoſite bank, was named in honour of his horſe Bucephalus, who died there, worn out by age and ſervice. A large diviſion of the army remained under the command of Craterus, to build and fortify theſe new cities.

In promoting the ſucceſs of Alexander, the fame of his generoſity conſpired with the power of his arms. Without encountering any memorable reſiſtance, he reduced the dominions of another prince named Porus, and the valuable country between the Aceſines and the Hydraotes. In effecting this conqueſt, the obſtacles of nature were the principal enemies he had to encounter. The river Aceſines, fifteen furlongs broad, is deep and rapid; many parts of its channel are filled with ſharp rocks, which, oppoſing the rapidity of the ſtream, occaſion boiling eddies and whirlpools, equally formidable and dangerous. Of the Macedonians, who attempted to paſs in boats, many drove againſt the rocks, and periſhed; but ſuch as employed hides, reached the oppoſite ſhore in ſafety. The Hydraotes is of the ſame breadth with the Aceſines, but flows with a gentle current. On its eaſtern bank, Alexander learned that the Cathaei, Malli, and other Indian tribes, prepared to reſiſt his progreſs. They had encamped near the city Sangala,

Sangala, two days march from the Hydraotes; and, inſtead of a breaſt-work, had fortified themſelves with a triple row of carriages. Alexander advanced with his cavalry; the Indians ſtirred not from their poſt, but, mounting their carriages, poured forth a ſhower of miſſile weapons. Alexander perceiving the cavalry unfit for ſuch an attack, immediately diſmounted, and conducted a battalion of foot againſt the enemy. The lines were attacked, where weakeſt; ſome paſſages were opened; the Macedonians ruſhed in; and the Indians, being ſucceſſively driven from their triple barrier, fled in precipitation to Sangala. Alexander inveſted the greateſt part of the town with a rampart and a ditch, and prepared to advance his engines to batter the walls, when he was informed by ſome deſerters, that the enemy reſolved, that very night, to force their way out with their whole ſtrength. Upon this intelligence he poſted Ptolemy, the ſon of Lagus, with three thouſand targeteers, one troop of archers, and all the Agrians, upon the ſpot where he conjectured that the beſieged would attempt to force their paſſage. At the firſt ſound of the trumpet, the other commanders were to advance to the aſſiſtance of Ptolemy. Alexander declared his intention to ſhare the common danger. By this judicious diſpoſition the enemy were ſucceſsfully repelled, after leaving five hundred men dead on the ſpot. Meanwhile king Porus arrived in the camp with five thouſand Indians, and a conſiderable number of elephants. Encouraged by this reinforcement, the Macedonians prepared to terminate the ſiege. The engines were got ready; the ſcaling ladders were fixed; ſeveral breaches were made; and the town was taken by a moſt ſanguinary aſſault. Seventeen thouſand Indians are ſaid to have periſhed in the ſack of Sangala; above ſeventy thouſand were taken priſoners; and Sangala was razed to the ground. Above an hundred Macedonians fell in the aſſault; twelve hundred were wounded.

The perſevering intrepidity of Alexander thus rendered him maſter of the valuable country, now called the Panjab, or Lahore, watered by the five great ſtreams whoſe confluence forms the Indus. The banks of the Hyphaſis, the moſt eaſtern of theſe rivers, which he actually intended to croſs, allured by the flattering deſcription of the adjoining territory, were adorned by twelve Macedonian altars, equal in height, and exceeding in bulk, the greateſt towers in that country. Theſe monuments, erected midway between Delhi and Lahore, marked the extremity of Alexander's empire; an empire thus limited, not by the difficulties of the country, or the oppoſition of enemies, but by the immoveable and unanimous reſolution of his European troops. Invincible by his enemies, Alexander ſubmitted to his friends, at whoſe deſire he ſet bounds to his trophies in the Eaſt. But his reſtleſs curioſity prepared new toils and dangers for the army and himſelf. Having returned to the cities of Nicæa and Bucephalia, he divided his forces, for the ſake of exploring more carefully the unknown regions of India. Two diviſions, reſpectively commanded by Craterus and Hephæſtion, (for Cænus was now dead,) had orders to march ſouthward along the oppoſite banks of the Hydaſpes; his brother Philip Aridæus, to whom he had committed the government of the provinces adjacent to Bactria, was recalled with the troops under his command; and the whole Macedonian conqueſts in India, including ſeven nations and above two thouſand cities, were ſubjected to the dominion of Porus. Meanwhile the Ionians, Cyprians, Phœnicians, and other maritime nations who followed the ſtandard of Alexander, built or collected above two thouſand veſſels, for ſailing down the Hydaſpes till its junction with the Indus, and thence along that majeſtic ſtream to the Indian ocean. On-board this fleet the king embarked in perſon with the third diviſion of his forces. His navigation employed ſeveral months, being frequently retarded by hoſtilities with the natives, particularly the warlike tribe of the Malli. Theſe barbarians were driven from the open country; their cities were ſucceſſively beſieged and taken; but, at the ſtorm of their capital, a ſcene was tranſacted, which betrayed temerity even in Alexander.

When their ſtreets were filled with the enemy, the Malli took refuge in the citadel. This fortreſs was defended by a thick wall, which being thrown around the declivity of a mountain, was extremely lofty without, but towards the inner circumference of an inconſiderable height. Alexander, provoked by the obſtinacy of the Indians, commanded the ſcaling-ladders to be applied with all poſſible expedition. But this ſervice being performed more tardily than uſual, the king, in his anger, ſnatched a ladder from one who carried it, and having faſtened it to the wall, mounted with rapidity in defiance of the enemy's weapons. The Macedonians, alarmed by the danger of their general, followed in ſuch numbers, that the ladder broke as Alexander reached the ſummit; the ſame accident happened to other ladders which were haſtily applied, and injudiciouſly crowded. For ſome moments, the king thus remained alone on the wall, conſpicuous by the brightneſs of his arms, and expoſed to thick vollies of hoſtile darts from the adjacent towers. His reſolution was more than daring. At one bound he ſprang into the place, and poſting himſelf at the wall, ſlew the chief of the Malli, and three others, who ventured to aſſault him. Meanwhile Abreas, Leonnatus, and Peuceſtas, the only Macedonians who had reached the top of the wall, imitated the example of Alexander. Abreas was wounded and fell; his companions, regardleſs of their own ſafety, defended the king, whoſe breaſt had been pierced with an arrow. They were ſoon covered with wounds, and Alexander ſeemed ready to expire. By this time, the Macedonians had burſt through the gates of the fortreſs. Their firſt concern was to carry off the king; the ſecond to revenge his death, for they believed the wound to be mortal. Some report, that the weapon was extracted by Critodemus of Cos; others, that no ſurgeon being near, Perdiccas, of the life-guards, opened the wound with his ſword, by his maſter's command. The great effuſion of blood threatened his immediate diſſolution; while the affectionate admiration in which he was held by the troops, appeared in their gloomy ſadneſs during his danger, and their immoderate joy at his recovery.

Alexander having accompliſhed his voyage to the Indian Ocean, determined to proceed towards Perſepolis, through the barren ſolitudes of Gedroſia. This arduous deſign was not inſpired by an idle ambition to ſurpaſs the exploits of Cyrus and Semiramis, whoſe armies were ſaid to have periſhed in thoſe deſerts, but was prompted by nobler views, while the firſt European fleet which navigated the Indian ſea, explored the Perſian gulph, and examined the mouths of the Euphrates and the Tigris. This important voyage was performed by Nearchus, whoſe enterpriſing genius was worthy of the maſter whom he ſerved. In diſcovering the ſea and the land, the fleet and army of Alexander mutually aſſiſted each other. By the example of the king, both were taught to deſpiſe toil and danger. On foot, and encumbered with his armour, he traverſed the tempeſtuous ſands of the Perſian coaſt, ſharing the hunger, thirſt, and fatigue, of the meaneſt ſoldier; nor was it till after a march of two months, diſtinguiſhed by unexampled hardſhips, that the army emerged into the cultivated province of Carmania. Here Alexander was met by a diviſion of his forces, which he had ſent under the command of Craterus through the territories of the Arii and Drangæ. Staſanor and Phrataphernes, governors of thoſe warlike nations, and of the more northern provinces of Parthia and Hyrcania, brought a ſeaſonable ſupply of camels and other beaſts of burthen, to relieve the exigencies of an army enfeebled by diſeaſe and exhauſted by fatigue. The waſte of men occaſioned by this deſtructive expedition, was repaired by the arrival of numerous battalions from Media, which rendered

the ſtandard of Alexander ſufficiently reſpectable. Cleander and Sitalus, the commanders of thoſe forces, were accuſed by the Medes of deſpoiling their temples, ranſacking their tombs, and committing other deteſtable deeds of avarice and cruelty. Their own ſoldiers confirmed the accuſation; and their crimes were puniſhed with death. This prompt juſtice gave immediate ſatisfaction, and ſerved as a ſalutary example in future; for, of all the rules of government practiſed by this illuſtrious conqueror, none had a ſtronger tendency to confirm his authority, and conſolidate his empire, than his vigilance to reſtrain the rapacity of his lieutenants, and to defend his ſubjects from oppreſſion.

Encouraged by the long abſence of Alexander, and the perils to which his adventurous character continually expoſed his life, Harpalus, Orſines, and Abulites, governors of Babylon, Perſepolis, and Suſa, began to deſpiſe his orders, and to act as independent princes, rather than accountable miniſters. In ſuch emergencies, Alexander knew by experience the advantage of celerity. He therefore divided his army. The greater part of the heavy-armed troops were entruſted to Hephæſtion, with orders to proceed along the ſea-coaſt, and to attend the motions of the fleet commanded by Nearchus. With the remainder, the king haſtened to Paſargadæ. Orſines was convicted of many enormous crimes, which were puniſhed with adequate ſeverity. Baryaxes, a Mede, who had aſſumed the royal tiara, ſuffered death; and his adherents ſhared his fate. The return of Alexander from the eaſt proved fatal to Abulites, and his ſon Oxathres, who had cruelly oppreſſed the wealthy province of Suſiana, and particularly the inhabitants of the capital. Harpalus, whoſe conduct at Babylon had proved equally flagitious, eſcaped with his treaſures to Athens; but by a decree of the people he was expelled from Attica, and this traitor to the moſt generous of princes ſeems himſelf to have been ſoon afterwards treacherouſly ſlain. The brave Peuceſtas, who had ſaved Alexander's life at the aſſault of the Mallian fortreſs, was promoted to the government of Perſia; and in this important command, he ſhewed that the virtues of ſound policy are not incompatible with the moſt adventurous valour.

In the central provinces of his new empire, which from time immemorial had been the ſeat of Aſiatic pomp and luxury, Alexander ſpent the laſt, and not the leaſt glorious, year of his reign. In the figurative language of antiquity, the world was ſilent in his preſence; and his only remaining care was to improve and conſolidate his conqueſts. For theſe important purpoſes, he carefully examined the courſe of the Eulæus, the Tigris, and the Euphrates; and the indefatigable induſtry of his troops was judiciouſly employed in removing the weirs, or dams, by which the timid ignorance of the Aſſyrian and Perſian kings had obſtructed the navigation of thoſe great rivers. But Alexander, having no reaſon to dread fleets of war, was anxious to invite thoſe of commerce. The harbours were repaired; arſenals were conſtructed; a baſon was formed at Babylon ſufficient to contain a thouſand gallies. By theſe and ſimilar improvements, he expected to facilitate internal intercourſe among his central provinces, while, by opening new channels of communication, he hoped to unite the productive countries of Egypt and the Eaſt with the moſt remote regions of the earth. But objects leſs remote demanded his more immediate attention. In the winter ſeaſon, the waters of the Euphrates, which produce the extraordinary fertility of Aſſyria, are confined within their lofty channel. But in the ſpring and ſummer, and eſpecially towards the ſummer ſolſtice, they overflow their banks, and, inſtead of watering, would totally deluge the adjacent territory, unleſs the ſuperfluous moiſture were diſcharged into the great canal of Pallacopas. This artificial river, formed, it is ſaid, by Nebuchadnezzar, commences an hundred miles below Babylon. It is not fed by ſprings, nor repleniſhed from mountain ſnows, but branching from the great trunk of the Euphrates, moderates its too impetuous ſtream by diverting it into the ſea, through lakes and marſhes, by various, and for the moſt part inviſible, outlets. But this uſeful contrivance finally defeated its own purpoſe. The Pallacopas gradually ſunk into its ſoft and oozy bed, and the Euphrates, which even originally was much higher than this canal, continued to flow into the new channel, even after the ſeaſon when its waters ceaſe to riſe by the melting of the Armenian ſnows. This diminution of the river rendered it inſufficient to water the fields of Aſſyria; an inconvenience ſeverely felt in a country almoſt unacquainted with rain. The governors of Babylon attempted unſucceſsfully to remedy the evil, whoſe magnitude juſtly excited the attention of Alexander. From war, the mother of neceſſity, he had learned to improve the benefits of peace. While preparations were making for more diſtant expeditions, he ſailed down the Euphrates; carefully examined the nature of the ſoil; and having diſcovered, at the diſtance of about four miles from the inoſculation of the Euphrates and Pallacopas, a hard and rocky bottom, he commanded a canal to be cut there, which ſerved to moderate the inundations at one ſeaſon, without too much draining the waters at another. Having performed this eſſential ſervice to Aſſyria, he followed the courſe of the Pallacopas, and ſurveyed the lakes and marſhes, which guard the Arabian frontiers. In the neighbourhood of his new canal, he obſerved a convenient ſituation for a city, which, being built and fortified, was peopled with thoſe ſuperannuated Greeks who ſeemed no longer capable of military ſervice, and with ſuch others of their countrymen as thought proper to ſettle in this fertile, though remote, country.

In returning from his expedition towards the banks of the Euphrates, Alexander was met by ambaſſadors from Carthage, Spain, and Italy, as well as from many inland countries of Aſia and Africa, extending from Mount Imaus to the ſouthern extremity of Æthiopia. It was then, ſays his hiſtorian, that he appeared maſter of the world, both to his followers and to himſelf; and, as if the known parts of it had been inſufficient to ſatisfy his ambition, he gave orders to cut timber in the Hyrcanian foreſt, with a deſign to build ſhips, and explore the undiſcovered ſhores of the Caſpian and Arabian ſeas. But neither theſe lofty deſigns, nor the glory of war, nor the pomp of royalty, which, of all princes, Alexander enjoyed in the greateſt ſplendour, could appeaſe his grief for the loſs of Hephæſtion, whoſe death is ſaid, by Arrian, to have haſtened his own. It certainly tinged his character with a deep melancholy, which rendered him ſuſceptible of ſuch impreſſions as the firmneſs of his mind would otherwiſe have reſiſted and repelled. His melancholy, however, appears to have been diverted by the voyage down the Euphrates, and by directing the improvements in the canal of Pallacopas. On returning to Babylon, he gave audience to ſome Grecian ambaſſadors; and having reviewed his troops and gallies, prepared to execute the enterpriſes which he had ſo long meditated. But his deſigns and his life were rapidly drawing to a cloſe. Whether to conquer his melancholy, or to triumph in the vivacities of the table, he indulged without moderation in that banqueting and feſtivity to which, after the fatigues of war, he had often ſhewn himſelf too much addicted; and a fever, occaſioned, or at leaſt increaſed, by an exceſſive abuſe of wine, the vice of his nation and of his family, put a period to his life on the 28th of May, in the thirty-third year of his age, the thirteenth of his reign, and in the year before Chriſt 324.—For various anecdotes of his life, &c. ſee the article ALEXANDER, vol. i. p. 269.

Such was the reign of Alexander, whoſe character, being

being unexampled and inimitable, can only be explained by relating his actions. He was of a low ſtature, and ſomewhat deformed; but the activity and elevation of his mind animated and ennobled his frame. By a life of continual labour, and by an early and habitual practice of the gymnaſtic exerciſes, he had hardened his body againſt the impreſſions of cold and heat, hunger and thirſt, and prepared his conſtitution for bearing ſuch exertions of ſtrength and activity, as have appeared incredible to the undiſciplined ſoftneſs of modern times. In generoſity and in proweſs, he rivalled the greateſt heroes of antiquity; and in the race of glory, having finally outſtripped all competitors, became ambitious to ſurpaſs himſelf. His ſuperior ſkill in war gave uninterrupted ſucceſs to his arms; and his natural humanity, enlightened by the philoſophy of Greece, taught him to improve his conqueſts to the beſt intereſts of mankind. In his extenſive dominions, he built, or founded, not leſs than ſeventy cities, the ſituation of which being choſen with conſummate wiſdom, tended to facilitate communication, to promote commerce, and to diffuſe civility, through the greateſt nations of the earth. It may be ſuſpected, indeed, that he miſtook the extent of human power, when in the courſe of one reign, he undertook to change the face of the world; and that he miſcalculated the ſtubbornneſs of ignorance, and the force of habit, when he attempted to enlighten barbariſm, to ſoften ſervitude, and to tranſplant the improvements of Greece into an African and Aſiatic ſoil. Yet let not the deſigns of Alexander be too haſtily accuſed of extravagance. Whoever ſeriouſly conſiders what he actually performed before his thirty-third year, will be cautious of determining what he might have accompliſhed, had he reached the ordinary term of human life. His reſources were peculiar to himſelf; and ſuch views, as well as actions, became him, as would have become none beſides. In the language of a philoſophical hiſtorian, "he ſeems to have been given to the world by a peculiar diſpenſation of Providence, being a man like to none other of the human kind." Arrian, p. 168.

From the part which his father Philip and himſelf acted in the affairs of Greece, his hiſtory has been tranſmitted through the impure channels of exaggerated flattery, or malignant envy. The innumerable fictions which diſgrace the works of his biographers, are contradicted by the moſt authentic accounts of his reign, and inconſiſtent with thoſe public tranſactions, which concurring authorities confirm. Hence the various and inconſiſtent ſketches which have been given of the life of this extraordinary man, whoſe genius might have renovated and improved the ſtate of the ancient world. But the ſpirit of improvement is tranſient, and demands perpetual efforts; the ſources of degeneracy are permanent and innumerable. It ſeems at firſt ſight to be regretted, that by neglecting to provide for the ſucceſſion to his throne, he left the field open for thoſe bloody wars among his chiefs, which long deſolated the earth. Yet the difficulties with which he was himſelf obliged to ſtruggle, might teach him the impoſſibility of ſecuring the empire for the infancy of his ſon Hercules, or the weakneſs of his brother Philip Aridæus. The principles of royal ſucceſſion were never aſcertained in Macedon; and the camp of a conqueror could not be expected to prove a ſchool of moderation or juſtice. The firſt meaſure adopted by his generals was, to ſet aſide the hereditary claim of Hercules, born of the daughter of Darius, and to appoint Aridæus, together with the fruit of Roxana's pregnancy, if ſhe brought forth a ſon, to be joint heirs of the monarchy; Roxana eventually brought forth a ſon, named after his father, Alexander; and who, with Philip Aridæus, were for a time ſtiled, "the two kings." Perdiccas, in virtue of poſſeſſing the ſignet of his deceaſed maſter, aſſumed the regency: the troops and provinces were divided among the other chiefs, who, having been formerly the equals, diſdained to remain the inferiors, of Perdiccas. Each general truſted in his ſword for an independent eſtabliſhment; new troops were raiſed and diſciplined; leagues formed and broken; and the children and relations of Alexander, who became ſucceſſively priſoners in different hands, all periſhed miſerably, without a chance of ſucceeding to the dignity and honours of their illuſtrious houſe. A council was indeed held, in which it was reſolved that the following arrangements ſhould take place, in the name of the two kings. Antipater had the government of the European provinces, as general of the army in that continent; Craterus was veſted with the title of protector in that part; and Perdiccas had the command of the houſehold troops, in the room of Hephæſtion. Ptolemy, the ſon of Lagus, had Egypt, Lybia, and that part of Arabia which borders upon Egypt. To Lyſimachus was appointed Thrace and the Cherſoneſe; Eumenes had Paphlagonia and Cappadocia; Antigonus had Phrygia the greater, Lycia, and Pamphylia; and Seleucus was appointed commander of the royal cavalry.

The news of Alexander's death, having reached Athens, excited a conſiderable tumult in that city, and occaſioned univerſal demonſtrations of joy. The people, who had reluctantly, but ſilently, endured the Macedonian yoke, immediately prepared for war; and a deputation was ſent to all the ſtates of Greece, inviting them to join in a confederacy againſt Macedonia. Demoſthenes, who amidſt his misfortunes always retained an ardent zeal for the intereſt and glory of his country, was at that time in exile at Megara. He, however, joined himſelf with the Athenian ambaſſadors, and, ſeconding their remonſtrances by the irreſiſtible force of his eloquence, engaged Argos, Corinth, and the other cities of Peloponneſus, to accede to the league, for reſtoring the liberty of Greece. The Athenians, ſtruck with admiration at ſo generous and diſintereſted a conduct, paſſed a decree, that Demoſthenes ſhould be recalled from baniſhment: a galley was therefore diſpatched for him at Ægina, and when he entered the Piræus, the magiſtrates and principal perſons of the city went to meet this illuſtrious exile, and received him with the greateſt demonſtrations of joy and affection.

Leoſthenes the Athenian general, having raiſed a powerful army of confederated Greeks, marched againſt Antipater. That general being appriſed of the commotions in Greece, diſpatched a courier to Craterus in Cilicia, to march to his aſſiſtance. Antipater had no ſooner joined the reinforcement under the command of Craterus than a general engagement took place near the city of Cranon, in Theſſaly, in which the confederated Greeks ſuffered a moſt ſignal defeat; inſomuch that after the battle, a deputation was ſent to Antipater, ſupplicating a general peace. That commander, however, replied, that he would only treat ſeparately with the ſeveral ſtates and cities of the confederacy. This anſwer being received, the negociation was ſuſpended; and the Greeks, diſbanding their troops, returned home. In a ſhort time, however, every ſtate was under the neceſſity of acceding to whatever terms Antipater thought fit to propoſe. Athens was the only city that was excepted from the peace. Phocion was ſent at the head of an embaſſy to conciliate the favour of Antipater, and to negociate with that general a treaty of amity. The terms, however, on which this favour was granted, were equally ſubverſive of Athenian honour and power: it was demanded that Demoſthenes and Hyperides ſhould be delivered up; and that Athens ſhould receive a Macedonian garriſon, and defray the expences of the war. To this humiliating condition was Athens reduced, which had formerly been the glory of the world! Upwards of twelve thouſand Athenians were diſfranchiſed; many of them, finding their ſituation inſupportable, went into Thrace, and ſettled there. Demoſthenes fled

to Celauria, a ſmall iſland oppoſite to Troezene. Antipater, informed that the orator had eluded his vengeance by flight, diſpatched Archias to ſeize him. But Demoſthenes, anticipating the deſigns of the tyrant, ſwallowed poiſon, and died at the foot of the altar, where he had taken ſanctuary.—See the article DEMOSTHENES, vol. v. p. 715.

Perdiccas, who had formerly married Nicea the daughter of Antipater, was now deſirous of eſpouſing Cleopatra, ſiſter of the late king. So near an alliance with the family of Alexander would, he expected, ſecure to him the throne. Antigonus penetrated the deſign of Perdiccas, and foreſaw that the ſucceſs of the regent would be his own deſtruction; he therefore paſſed over into Greece, and diſcloſed to Antipater the plan which Perdiccas had formed for obtaining the ſovereignty. Ptolemy alſo was engaged in their intereſt; and preparations were made for fruſtrating the projects of the regent. Ptolemy alſo remonſtrated with Perdiccas on the inequality of the arrangements which had been made in the empire, and was the firſt of the united chiefs who prepared to act the part of an independent ſovereign. Perdiccas deliberated whether he ſhould march into Egypt againſt Ptolemy, or firſt direct his courſe towards Macedonia againſt Antipater and Craterus. The preparations, however, which Ptolemy had made, ſeemed too alarming to admit of delay; it was therefore reſolved, that Perdiccas ſhould march againſt him, while Eumenes, with a numerous body of forces, guarded the Aſiatic provinces againſt Antipater and Craterus. After undergoing conſiderable fatigue, the regent paſſed the Egyptian frontier. Hoſtilities immediately commenced, and vigorous efforts were made by the royal troops againſt Ptolemy, but in vain. His forces were uniformly victorious; and the ſoldiers of Perdiccas, dejected by their ill ſucceſs, mutinied, and ſlew him in his tent.

During theſe tranſactions the other parties were not inactive: Antipater entered Cilicia with an intention of aſſiſting Ptolemy in Egypt; and Craterus was detached with the remainder of the forces againſt Eumenes, who was then in Cappadocia. The reputation of Craterus was ſo great among the Macedonians, that it was expected when he appeared in the field, all the national troops of the hoſtile army would immediately revolt, and arrange themſelves under his banner. Eumenes was aware of this danger, and in order to guard againſt it, kept his army ignorant of the enemy againſt whom they had to contend, and poſted the foreign troops oppoſite the Macedonian ſoldiers. By that cautious management the forces under the command of Eumenes never knew againſt whom they fought, until they beheld Craterus breathleſs on the field of battle. By his death, Philla, the daughter of Antipater, whom he had married, was left a widow. From a two-fold cauſe, therefore, Antipater muſt have been afflicted by the loſs of Craterus. He was not, however, doomed to mourn long; a palliative was ſoon brought him, which was the intelligence of the death of Perdiccas. In conſequence of that event, Antipater was ſolicited to join the army in Syria, in order to make new arrangements for the government of the empire. He therefore haſtened thither, and upon his arrival was unanimouſly elected protector of the two kings.

As ſoon as he was inveſted with this authority, he made a new partition of the provinces, in which all thoſe were excluded who had eſpouſed the intereſts of Perdiccas and Eumenes. Seleucus, who had great authority from the command of the cavalry, obtained the government of Babylon, and afterwards became the moſt powerful of all Alexander's ſucceſſors. Antipater having adjuſted matters in Aſia, ſent Antigonus with an army againſt Eumenes. His ſon Caſſander was alſo appointed to the command of a conſiderable body of troops, with ſecret injunctions to guard with a jealous eye the proceedings of Antigonus. Antipater then returned to Macedon; and Antigonus prepared to act with vigour againſt Eumenes. An engagement took place in the year before Chriſt 320, in which Eumenes, by the treachery of one of his ſoldiers, was completely defeated. This diſcomfiture, however, occaſioned one of the moſt extraordinary actions of his life: he returned unperceived to the field of battle, burned the bodies of his ſlain companions, and raiſed over their aſhes a mound of earth; then diſmiſſing the ſick and wounded of his army, he retired with ſix hundred men to the caſtle of Nora, a place of great ſtrength on the frontiers of Cappadocia, in which he ſuſtained a ſiege of twelve months, againſt the whole ſtrength of Antigonus's army, and at length forced it to retire.

Antipater did not long ſurvive his return from the Aſiatic expedition. Finding his end approaching he aſſembled the friends of his country, and gave them inſtructions relative to the courſe of conduct, which it was equally their duty and their intereſt to purſue. It was neceſſary to appoint a governor over Macedon, and a regent of the empire. He knew the importance of thoſe ſtations, and was ſenſible that his own glory and reputation, the intereſt of the ſtate, and the preſervation of the Macedonian empire, required a perſon to be nominated whoſe age and experience would command authority and reſpect. Under theſe impreſſions he bequeathed to Polyperchon, the eldeſt of all Alexander's captains at that time in Europe, the two high offices of protector and governor of Macedon. Thus did he ſacrifice the intereſt of his own family to that of the empire, and died full of years and glory.

Caſſander, who was at that time in Aſia, apprehending in what a perilous ſituation his father Antipater's death had left himſelf and the friends of the late adminiſtration in Macedon, was reſolved to attempt ſomething for their ſtability. He revolved in his mind the high character of Polyperchon; and his ambition prompted him to attempt the recovery of that oſtenſible command, of which he had been deprived by the will of his father. Under the pretence, therefore, of taking the diverſion of hunting, he engaged ſeveral of his friends to accompany him into the country, where he freely diſcloſed his mind. He expatiated on the dangers that threatened them from the junction of intereſts between Polyperchon and Olympias, who was the implacable enemy of Antipater's friends, and whom the protector had recalled from her retirement in Epirus, and had appointed her to ſuperintend the rearing of Alexander, the ſon of Roxana. His remonſtrances produced the deſired effect; and many avowed themſelves his partiſans, in whoſe confidence he reſolved to act independently and openly. But while Caſſander was thus employed in forming projects for ſubverting the government, Polyperchon was equally buſied in ſecuring his dominions in Greece. He had held a council of ſtate, in which it was determined that all the governors whom Antipater had appointed in the Grecian communities ſhould be diſplaced, and that democracy ſhould be every-where re-eſtabliſhed. The main object of this edict was to break the power of the late governors; but they were unwilling to ſubmit to a decree which evidently tended to their prejudice; they therefore inſtantly joined Caſſander. Athens being of more conſequence to the Macedonian government than any other Grecian ſtate, the eyes of all men were turned on Nicanor, governor of that city. Had Nicanor immediately complied with the injunctions of the edict, moſt of the other cities and ſtates in Greece would have followed his example: but he expreſſed a diffidence at firſt, and after ſome further procraſtination, ſeized and fortified himſelf in the Piræus.

The Athenians, provoked at the conduct of Nicanor, determined to rid themſelves of thoſe that ſeemed to oppoſe the views of the edict, and the renewal of their democratical form of government. For that purpoſe they

they turned their fury upon the patriotic Phocion, and ſome of the moſt diſtinguiſhed citizens of Athens. Theſe withdrew from the rage of the people, and threw themſelves on the mercy of Alexander the ſon of Polyperchon, who was entering Attica with a powerful army; and by this time alſo the protector himſelf was at hand, with Philip Aridæus, and another large body of forces. Alexander, having heard Phocion and the other fugitives relate their account of the matter, was convinced of their innocence, and in conſequence ſent letters of recommendation with them to his father; but ſcarcely were they arrived at the camp of the regent, when deputies came from Athens, accuſing them of high treaſon. Polyperchon was at a loſs for ſome time how he ſhould act: at length he gave orders that Dinarchus, a Corinthian, ſhould be put to death; while Phocion and his companions were bound and ſent back to Athens, with this meſſage, "That though he was convinced they had been traitors to their country, yet he left them to the judgment of the Athenians as a free people." Phocion, Nicocles, Aheudippus, Agamon, and Pythocles, were ſentenced to ſuffer death; and Demetrius Phalereus, Callimedon, Charicles, and others, were condemned in their abſence. Many perſons placed garlands on their heads, and demonſtrated all the ſatisfaction that could have been felt had the moſt powerful enemy of the public ſuffered a defeat. An intimate friend took the opportunity of aſking Phocion, as they were bearing him to execution, if he had any commands to his ſon. "Only," replied he very coolly, "that he forget the ill treatment which his father received from the Athenians." In a very ſhort time, however, the Athenians paſſed from one extreme to the other. They recollected the manifold ſervices Phocion had performed to the ſtate; and therefore decreed the victim of their rage a ſtatue of braſs; and paſſed an act that his accuſers ſhould be put to death. Agonides, who was the principal perſon in promoting the plot againſt him, was ſeized and executed; but Epicurus and Demophilus fled. Phocion's ſon, however, purſued and ſlew them.

While theſe things were tranſacting, Caſſander, in the year before Chriſt 318, ſeeing no hopes of ſucceſs to his undertaking in Europe, judged it neceſſary to try ſome other quarter. Antigonus, he was ſenſible, would be ready to oppoſe any perſon that ſhould poſſeſs the high office of protector of the kings; and to him, therefore, he determined to apply for aſſiſtance. Antigonus received Caſſander with the greateſt kindneſs. He hated Polyperchon; and to execute vengeance on him he ſaw would be the ſhorteſt road to the conqueſt of Aſia, which was the great object of his ambition. The forces which Caſſander obtained of Antigonus were not numerous, but to a man of his enterpriſing genius, any number of troops proved of conſiderable importance, and were capable of achieving great exploits. With theſe reinforcements he ſailed for Athens, and entering the Piræus with his ſmall fleet, was welcomed to Greece by Nicanor. Polyperchon, being informed of the arrival of Caſſander, inſtantly reſolved to bring him to action. For that purpoſe, he aſſembled a large army, and marched into Attica. But the numerous forces which he had collected, ſoon cauſing a ſcarcity of proviſions in that country, induced the protector to alter the meaſures he had firſt propoſed. Leaving troops, therefore, under the command of his ſon Alexander in Attica, who had orders to obſerve the motions of the enemy, and to keep them in check, he marched with the reſt of the army into Peloponneſus, where he knew his opponent had many friends. By this time Clytus, with the Macedonian fleet, had ſet ſail to meet that of Caſſander, which was under the conduct of Nicanor. A battle was fought, in which this latter commander was defeated, and obliged to betake himſelf to flight. The fleet of Nicanor, however, being refitted, and reinforced by light-armed troops ſent over in barks by Antigonus, he ſoon found himſelf in a condition to face the enemy again. Having, therefore, put to ſea, he came up with the ſquadron of Clytus, whilſt at anchor at Byzantium, and obtained a complete victory. After the engagement, Clytus himſelf was killed by an inſurrection of the ſoldiers of Lyſimachus.

In the mean time Polyperchon had entered Peloponneſus, where he determined that his commands ſhould be obeyed, and in caſe of refuſal, threatened to inflict the moſt ſevere puniſhment. This was carried into execution in moſt of the Grecian communities; and diſcord, ſlaughter, and confuſion, every-where prevailed. Thoſe who had borne any office under the adminiſtration of Antipater were put to death, or driven into baniſhment. Theſe tyrannical acts excited the juſt odium of the diſcerning part of the people, who began in conſequence to deſert his cauſe, while Caſſander was gathering freſh ſtrength in Attica. After Nicanor had defeated Clytus, he again reſumed the government of the Pyræus. Caſſander, ſenſible of the ſervices which Nicanor had rendered to his cauſe, ſhewed him the greateſt attention and reſpect. They were upon the moſt friendly terms, when ſome perſon acquainted Caſſander that the governor had a deſign to make himſelf ſovereign of Attica. It happened alſo that Nicanor had reluctantly complied with admitting Caſſander's troops into ſome of his forts; a circumſtance which, being united with that report, awakened further ſuſpicion. In order, therefore, to have Nicanor deſtroyed, Caſſander poſted ſome of his men in an empty houſe, and requeſted the governor to meet him there, under pretence of conſulting about matters of importance. Nicanor appeared, and when he entered, was attacked and murdered by the aſſaſſins. This ſanguinary meaſure rouſed the indignation of Nicanor's friends; but when they conſidered that Caſſander was already in poſſeſſion of the ſtrongeſt part of Athens, and that Polyperchon would not be able to grant them much aſſiſtance, they judged it proper to ſtifle their reſentment, and to ſubmit quietly to their fate. The engaging manners of Caſſander contributed not a little to reconcile the Athenians to his government; but his condeſcenſion favoured more of the crafty than of the generous prince.

Among the firſt acts of his power he appointed Demetrius Phalereus to be governor of Athens; he was a perſon of quality, a deſcendant of Conon, and poſſeſſed of extenſive property; but neither his birth nor his fortune was equal to his virtues. The moderation and mildneſs which he diſplayed towards the governed, procured him the eſteem and affection of the people. They were ſoon induced to repoſe the greateſt confidence in his wiſdom and integrity, and that confidence he did not betray. The power which he might eaſily have converted into tyranny, he employed in promoting the wealth and grandeur of the Athenians. He increaſed their public revenues; adorned the city with many ſtately and magnificent ſtructures, and reſtored ſuch as were likely to fall through the injuries of time. In every other reſpect he exhibited ſuch indiſputable marks of affection and regard for the people over whom he preſided, that they beſtowed on him very conſiderable honours.

The diſgrace which Polyperchon had in the mean time ſuſtained, made the protector ſenſible that he had no chance of aſſuming the ſovereignty of Greece. He was conſequently obliged to content himſelf with Macedon. Attica was now beyond the reach of his power; he therefore recalled Olympias from Epirus, to ſanction by her preſence the new adminiſtration of Macedon. Previouſly to her quitting Epirus, ſhe had written to Eumenes, then leading an army againſt Antigonus in Aſia, deſiring his advice, whether ſhe ſhould remain in her preſent ſituation, or return into Macedonia. Eumenes, who always had her intereſt at heart, informed her that

he conſidered it as moſt prudent to remain in Epirus until the war ſhould be terminated. He adviſed her not to be precipitate in her reſolutions, but that, in caſe ſhe did return to Macedon, ſhe ſhould forget the injuries which had been formerly done her, and endeavour to conciliate the affections and eſteem of the people. She diſregarded, however, this friendly admonition of Eumenes. When her preſence was announced at Pella, the Macedonian capital, great conſternation and diſmay ſeized the minds of the people. The friends of Antipater, however, by whoſe influence ſhe had been baniſhed Macedon, had ſtill greater reaſon to fear the conſequences of her return; but above all Philip Aridæus and his queen. Aridæus was the ſon of Philip by a concubine, and on that account he had from his infancy been ſubjected to the hatred and averſion of Olympias. It was not, therefore, to be ſuppoſed that either Philip, or Eurydice his wife, could look upon her with complacence. They, in fact, were ſenſible that they had every thing to fear from her power; and Eurydice, who had more diſcernment than her weak huſband, rightly conceived that Olympias would never be at reſt until ſhe had deprived Aridæus of the regal title and of his life. Under this impreſſion ſhe began to levy an army, and requeſted all who reſpected the brother of Alexander, their late royal maſter, or his queen, or who revered the virtues and memory of Antipater, to unite in the defence of the rights and liberties of their country. She then wrote to Caſſander, beſeeching him to haſten to her aſſiſtance, and required Polyperchon to meddle no more in the adminiſtration, but to deliver up all to Caſſander, to whom the king had deemed it expedient to delegate the regency of the empire.

Theſe haſty proceedings of Eurydice gave her enemies ſufficient pretext for levying an armed force to oppoſe her meaſures. Olympias, who had carefully obſerved her actions, perceived that it was neceſſary ſhe ſhould be on her guard againſt the deſigns of the queen. Her brother Æacidas had ſent a body of Epirots to eſcort her from his kingdom. Theſe ſhe added to ſome Macedonian troops, whom her intereſt and power induced to follow her fortunes; and ſtraightway marched her forces to join the army of Polyperchon, which was returning from his diſgraceful expedition into Peloponneſus. Having formed a junction, the whole united army moved to attack the troops of Eurydice, who, animated by the cruel treatment her family had received, boldly led forth her forces to oppoſe the enemy. It was not the intention of Eurydice to hazard a battle before the arrival of Caſſander; but her precipitation in raiſing forces had rouſed her adverſaries; and their motions being thus quickened, it was impoſſible to defer fighting until Caſſander could arrive with his army. The two contending parties therefore drew up their forces in order of battle; but the appearance of Olympias at the head of her troops, immediately terminated the diſpute. When the two armies approached each other, the ſoldiers that ſhould have fought for Eurydice, ſtruck with the awful mien of Olympias, who appeared to poſſeſs all the dignity and majeſty of the relict of Philip, and the mother of Alexander the Great, inſtantly deſerted their ſtandard, and ranged themſelves under the banners of the enemy. By this defection of the troops, Philip and Eurydice fell into the hands of Olympias, and ſhe cauſed them to be put to death.

Caſſander having received intelligence of this fatal event, haſtened into Macedonia. When he arrived at the ſtraits of Thermopylæ, he found the Theſſalians in arms ready to oppoſe his paſſage; but expedition being his main object, he collected all the ſhips he could procure in the neighbourhood, embarked his troops, and reached Macedon before Polyperchon and Olympias even ſuſpected his approach. Caſſander formed his army into two diviſions, one of which was under the command of Callas, while he himſelf took the lead of the other. Callas had orders to engage the troops of Polyperchon, which were now ſeparated from thoſe of Olympias; while Caſſander purſued the army of that vindictive woman. To ſupport her meaſures, ſhe went to all the principal cities, in company with her daughter Roxana, her grandſon Alexander, her niece Deidamia, Theſſalonica the ſiſter of Alexander, and many other perſons of high birth and intereſt. With this numerous retinue, ſhe was at length under the neceſſity of retiring to Pydna, a ſea-port and well-fortified town. Caſſander immediately inveſted the city by land, while his fleet blocked up the entrance of the harbour. The beſieged ſoon began to be in want of proviſions; but, encouraged by the preſence of many perſons of diſtinction, they obſtinately defended the place. Olympias alſo expected that her brother Æacidas would ſend ſuccours from Epirus to her aſſiſtance; which proved to be the caſe. Caſſander, therefore, knowing that the army of that prince was in motion, detached part of his troops to block up the paſſages into Epirus. This was done ſo completely, that the army of Æacidas was reduced to great difficulties, and not only deſpaired of the ſucceſs of the expedition, but of their own ſafety. Under theſe circumſtances the troops mutinied, and, depoſing Æacidas, ſubmitted to Caſſander. The only perſon on whom Olympias now relied, was Polyperchon; but the detachment under Callas employed his attention ſo much, that he was unable to afford her any aſſiſtance.

The condition of the beſieged was now become deplorable. The royal family fed on the fleſh of horſes, the ſoldiers on their dead companions, and the elephants on ſaw-duſt. Numbers were induced, by the miſeries which prevailed in the city, to deſert to Caſſander, who received with lenity all that had not been concerned in the late murders. Olympias again turned her thoughts towards Polyperchon. She wrote to him in the moſt preſſing terms to ſend a bark of fifty oars, to convey her away by night. Caſſander, however, having ſeized the meſſenger, diſappointed the deſign. Olympias, not finding the veſſel at the time ſhe expected, gave up all hopes, and ſurrendered herſelf and her army to Caſſander. This event determined the fate of Macedon. Pella, the capital, ſoon after ſubmitted to the conqueror; and Ariſtonus, who commanded a body of troops at Amphipolis, alſo yielded up that city. When Olympias ſubmitted, ſhe ſtipulated for her life: but the kindred of thoſe whoſe deaths ſhe had occaſioned, inſiſted that ſhe ſhould ſuffer. She was therefore accuſed before the aſſembly of the Macedonians, and without being heard in her defence, condemned to die. Caſſander adviſed her to make her eſcape to Athens, and offered her a ſhip of that purpoſe; but the relations for thoſe who had fallen ſacrifices to her cruelty, ſeized her, and cut her throat. Immediately after the death of Olympias, Roxana and her ſon Alexander were ſent to Amphipolis, where they were made priſoners; and orders were given that they ſhould be treated only as private perſons. Hercules the ſon of Alexander by Barcine, the only remaining branch of the royal family, was murdered by Polyperchon, at the inſtigation of Caſſander, about two years after; and thus the ſhort ſpace of eight years had ſcarcely elapſed ſince the death of Alexander, when not a ſingle branch of his houſe remained to enjoy a portion of that empire, which Philip and his ſon had acquired, at the expence of ſo much labour, blood, and treaſure.

While Caſſander employed his efforts to eſtabliſh himſelf on the throne of Macedon, and ſecure the ſovereignty of all Greece, Antigonus was concerting meaſures to rid himſelf of Eumenes, in Aſia. After being defeated by that general in moſt of the engagements that had taken place, Antigonus, in the year before Chriſt 315, determined to make one deſperate and deciſive effort. He reſolved to attack Eumenes in his winter quarters, when his troops were diſperſed all over

the

the country. The battle was fought near the ſea; and Eumenes, having the ſuperiority in infantry, again routed the phalanx of Antigonus; but the enemy's horſe had the advantage through the treachery of Pauceſtes, commander of the cavalry, who had ſecretly gone over to Antigonus. In this ſituation of the army, Teutamus, who commanded the troops called the *argyraſpidæ*, or ſilver-ſhields, and who had long inclined to Antigonus, took the opportunity of delivering up Eumenes, who was ſeized, and his hands bound behind him. He was thus ſhamefully conducted to the camp of Antigonus, who kept him a few days in confinement, and then commanded him to be executed.

The late ſucceſs of Antigonus opened a wide field for ambition, and he formed the deſign of making himſelf maſter of all Aſia. Many of the commanders, who lately oppoſed him, after the proſperous event of this battle, haſtened to make their ſubmiſſion, and to proffer their aid and ſupport in his undertaking. He readily accepted their acknowledgments of his ſuperiority, but determined to leſſen their number. He ſacrificed ſeveral of the inferior governors to his ambition; and, had not Seleucus ſtill ſtood in the way, it is probable that his reſentment and ſuſpicions would have been allayed. Seleucus had performed many ſignal ſervices to Antigonus, who, nevertheleſs, demanded an account of the revenues of his province, which diſcovered that he conſidered him as a dependent. Seleucus, aſtoniſhed at this requeſt, replied that he did not conſider he was any more obliged to give an account, than Antigonus had to demand it; ſince the province of Babylon had been conferred on him by the Macedonians, as the reward of his ſervices. Antigonus perſiſted in his right to have ſatisfaction, and began to threaten. Seleucus, therefore, conſidering the great power of his enemy, and the little proſpect there was that he ſhould be able to reſiſt him, got together a body of fifty horſe, and, quitting Babylon in the night, fled into Egypt.

That they might be more ſecure in their poſſeſſions, Ptolemy, Lyſimachus, Caſſander, and Seleucus, now entered into a confederacy, whereby they were bound to maintain the rights of each other. Antigonus being informed of this meaſure, determined to proceed immediately to hoſtilities, and to obtain, if poſſible, the provinces of Syria and Phœnicia, which were at that time in the poſſeſſion of Ptolemy. Accordingly he marched an army with the greateſt expedition; and before the enemy were aware of his approach, moſt of thoſe provinces ſubmitted to him. Finding that he could not carry on a ſucceſsful war againſt ſo many powerful princes, unleſs he could procure a fleet to co-operate with his land-forces, he ordered vaſt quantities of timber to be cut upon mount Libanus, and in other parts of his dominions; and before the end of the year he was ready to put to ſea with five hundred ſail. His firſt expedition was directed againſt Tyre, which, after a ſiege of four months, opened its gates to him. But when Antigonus was informed, that while he was thus employed in Phœnicia, Caſſander had led his forces towards the coaſt of Aſia Minor, and had made himſelf maſter of ſeveral provinces, he marched to oppoſe him. In a ſhort time, he encamped in the neighbourhood of Caſſander; but that commander, ſenſible of the inferiority of his troops in point of numbers, wiſely declined an engagement.

During the time of the expedition of Antigonus into Aſia Minor, Ptolemy Lagus entered Syria with a numerous army; but he had advanced no farther than Gaza, when Demetrius, who had been left to command the troops in thoſe parts during the abſence of his father, offered him battle. Ptolemy did not decline the engagement, but attacked and defeated the army of the enemy. Demetrius, finding it impoſſible to reſiſt the victorious forces, abandoned Phœnicia, Paleſtine, and Syria, to the conqueror. Ptolemy, flushed with his ſucceſs, diſpatched Cilles, one of his generals, with a very conſiderable army, to expel Demetrius from Upper Syria, where he, with the remains of his forces, had retired. Demetrius, having received intelligence that Cilles was marching againſt him, determined to fall upon him unawares; and he executed his deſign with ſuch celerity, that he totally defeated the enemy, and took ſeven thouſand priſoners, in the number of whom was Cilles himſelf. When Antigonus, who was in Phrygia, received the news of this victory, he joined his troops to thoſe of his ſon, and, obliging Ptolemy to retire into Egypt, the provinces of Syria, Phœnicia, and Judea, again became ſubject to their former maſter. The defeat of Demetrius, however, at Gaza, enabled Ptolemy to aſſiſt Seleucus in his claims on Babylon. Accordingly Seleucus was furniſhed with a ſmall body of troops, with which he marched to attempt the recovery of his kingdom. The army he commanded did not amount to more than thirteen hundred men, and he had to conduct them through that extenſive territory which lies between Phœnicia and Babylon, many diſtricts of which were in the intereſt of Antigonus; but he accompliſhed his purpoſe, and was reſtored to a command to which his abilities and virtues juſtly entitled him. The attachment of his people, together with the vigour of his own mind, ſecured to him the province of Babylon, and ſome neighbouring ſtates.

Antigonus and Demetrius were now become the enemies of the whole Macedonian government. In Europe the diſmemberment of the empire was dreaded; and in Aſia and Africa, they expected a ſovereign that would be equally arbitrary and deſpotic. All became alarmed, and were ready to liſten to any propoſals which might ſeem calculated to afford them relief. A general confederacy was, therefore, formed againſt Antigonus and Demetrius; but the activity and reſources of theſe generals appeared inexhauſtible. In Greece the Ætolians and Epirots, excited and ſupported by them, had taken the field againſt Caſſander. Ptolemy had carried his arms into Aſia Minor, and ſent his fleets to reduce the Ægean iſlands that leagued with Antigonus; to both theſe objects Antigonus was obliged to attend; whilſt, on the other hand, Lyſimachus and Caſſander attacked the provinces on the banks of the Helleſpont and Boſphorus. There alſo it was neceſſary for Antigonus and Demetrius to ſend forces: in ſhort, they were beſet with foes on every hand, but they, nevertheleſs, maintained their cauſe with aſtoniſhing vigour and ſucceſs.

While Athens was enjoying a ſtate of tranquillity under the adminiſtration of the deputy of Caſſander, Demetrius, in the year before Chriſt 306, appeared off the Piræus, with a fleet of two hundred and fifty ſhips. The Athenians were therefore obliged to ſubmit to this powerful armament, and Demetrius Phalereus, the governor, was expelled Athens. From Athens, Demetrius ſailed to Rhodes, and formed the ſiege of that iſland. Caſſander, in the mean while, endeavoured to regain poſſeſſion of the Piræus; but Demetrius returning, compelled him to raiſe the ſiege of Athens, and in a very little time ſtripped him of all his conqueſts. The reſult of this triumph was the ſubmiſſion of the greater part of Greece to the arms of Demetrius, and he was appointed commander in chief of all the Grecian forces. All the cities from the ſtraits of Thermopylæ to the iſthmus of Corinth yielded to his prevailing power; and alſo many cities in Peloponneſus. Caſſander, now fearing leſt Demetrius would purſue him into Macedon, ſent deputies to Antigonus in Syria, to conclude a treaty of peace; but Antigonus required the unconditional ſubmiſſion of Caſſander, and the renunciation of all claim, on his part, to the throne of Macedon. The confederacy was therefore renewed againſt Antigonus and Demetrius, and was compoſed of the Macedonians, the Thracians, and the Egyptians, with

ſeveral inferior ſtates. Lyſimachus had the command of the Thracians and a detachment of Macedonians; and Seleucus headed the Egyptians. Lyſimachus haſtened into Aſia and Phrygia. He offered terms of accommodation to Antigonus; but that prince was too confident of ſucceſs to liſten to his propoſals.

As ſoon as the ſeaſon permitted, Demetrius tranſported his forces out of Greece into Aſia, to join the troops of his father; and, in the year before Chriſt 301, the two grand armies faced each other, and were ready for an engagement in Phrygia. The forces of Antigonus amounted to ſeventy thouſand foot, ten thouſand horſe, and ſeventy-five elephants: thoſe of the confederates to ſixty-four thouſand foot, ten thouſand five hundred horſe, four hundred elephants, and a hundred and twenty chariots of war. Both armies were anxious about the event of a battle, by which the fate of kingdoms was to be decided. Antigonus, who had never before been ſeen to ſhrink from danger, betrayed evident marks of fear on this occaſion. Coming out of his tent on the morning of the battle, he ſtumbled and fell, which he ſuperſtitiouſly conſidered as a proof that his army would be defeated. This memorable and eventful engagement was fought near to Ipſus, a ſmall town in the province of Phrygia. Both armies fought with diſtinguiſhed bravery; and victory was long and ably conteſted. At length, however, Antigonus loſt his life; the Syrians were completely defeated; and Demetrius, with much difficulty, effected his eſcape at the head of nine thouſand men. In conſequence of this victory, the whole empire of Alexander was now deſtined to found the following kingdoms: Egypt, Lybia, Arabia, and Paleſtine, were aſſigned to the ſovereignty of Ptolemy Lagus or Soter; Macedonia and Greece to Caſſander; Bithynia and Thrace to Lyſimachus; and the remaining territories in Aſia, as far as the river Indus, which were called the kingdom of Syria, were given to Seleucus.

Caſſander entered upon his exalted ſtation amidſt all the inquietudes of ſovereign power, being encompaſſed by crafty and inſidious enemies. He died, however, in the peaceable poſſeſſion of the throne of Macedon, to which the greateſt part of Greece was annexed, in the year before Chriſt 298. After his death, his two ſons, Antipater and Alexander, laid claim to the kingdom. Alexander invited Pyrrhus king of Epirus, and Demetrius the ſon of Antigonus, to his aſſiſtance. Demetrius treacherouſly aſſaſſinated the young prince at an entertainment; and then juſtifying the death of Alexander in a formal harangue, he perſuaded the Macedonians to elect him king. Inſtead of repairing the devaſtations that the kingdom had ſuffered from conſtant wars, Demetrius, in the year 294 before Chriſt, engaged in new military enterprizes againſt Greece, Ætolia, Epirus, and Thrace. He abandoned himſelf, at the ſame time, to luxury, vanity, and extreme haughtineſs. This incited Pyrrhus, king of Epirus, to invade the Macedonian territories with a numerous and powerful army; Lyſimachus alſo poured his troops into the ſame country on the ſide of Thrace; and Ptolemy attacked with a fleet all his dominions in Greece. Demetrius, therefore, was obliged to abandon his kingdom; and, though he made ſeveral attempts to regain poſſeſſion of it, he was unſucceſsful. Pyrrhus aſſumed the ſovereignty of Macedon; but was in his turn expelled by Lyſimachus, who had acted with him in the revolution of that country. In the year before Chriſt 285, diſſenſions aroſe in the family of Lyſimachus, and the injured faction requeſted the aſſiſtance of Seleucus. This prince, though ſeventy-ſeven years of age, willingly heard the inſinuations of the enemies of Lyſimachus, hoping to annex the kingdom of Macedon and the ſtates of Greece to the dominions he then poſſeſſed. He therefore met Lyſimachus on the borders of Phrygia, in the Field of Cyrus. Lyſimachus was in the ſeventy-fourth year of his age. They were the only ſurviving generals of Alexander, and both fought with their uſual bravery. The army of Lyſimachus was defeated, and himſelf ſlain. Animated by a warm deſire of taking poſſeſſion of Macedon, Seleucus now paſſed the Helleſpont, and advanced with an army as far as Lyſimachia in Thrace. In the neighbourhood of that city, however, he was baſely murdered by Ptolemy Ceraunus, whom he had generouſly relieved, and for whoſe ſake he had commenced the war.

Ptolemy, having perſormed this execrable deed, put on the crown, and boldly declared himſelf king of Macedon, in the year before Chriſt 280. Not long after, a body of three hundred thouſand Gauls, leaving their country in queſt of new ſettlements, followed the courſe of the Danube for a conſiderable way, and then divided into three parties, one of which made an irruption into the Macedonian kingdom. An obſtinate and bloody engagement enſued, in which Ptolemy was taken priſoner and his head cut off, which was carried through the ranks on the top of a lance. Soſthenes, with the remains of the Macedonian troops, attacked and defeated the Gauls; but a freſh ſwarm of theſe barbarians, under the command of Brennus, attacked and cut Soſthenes and his army to pieces.

After the death of Soſthenes, and the evacuation of the kingdom of Macedon by the Gauls, Antigonus Gonatus, the ſon of Demetrius, aſſumed the ſovereignty, in the year before Chriſt 278. Before, however, he could reſtore the kingdom to its ancient ſtrength and luſtre, he was obliged to contend with Pyrrhus king of Epirus, who, indignant at the conduct of Antigonus, who had refuſed to grant ſome ſuccours which he requeſted, invaded the frontiers of Macedonia, and was joined by ſome of the ſoldiers of Antigonus, who deſerted the ſtandard of their monarch. An engagement enſued, in which the forces of Antigonus were defeated, and moſt of them cut off, and he himſelf was under the neceſſity of quitting Macedon. Returning again, however, after the departure of Pyrrhus, who left his ſon Ptolemy to govern his newly-acquired dominions, he ſuffered a ſecond defeat, and eſcaped with only ſeventeen attendants.

While theſe contentions took place in Macedon, Cleonymus, pretending to the throne of Sparta after the death of Eudamidas, endeavoured to exclude Arcus from the kingdom. The people, however, inclining to favour the latter, Cleonymus applied for redreſs to Pyrrhus, who marched an army into the Lacedæmonian territory. Pyrrhus had with him twenty thouſand foot, two thouſand horſe, and twenty-four elephants. Arcus was at this time in the iſland of Crete, with the flower of the Lacedæmonian army. After an obſtinate aſſault upon the city, which was as obſtinately reſiſted, and which was carried on for three days ſucceſſively, Pyrrhus was compelled to retire towards his own dominions. Antigonus and Arcus, who had arrived at Sparta to ſuccour the place, haraſſed his retreat. Pyrrhus ordered his ſon Ptolemy to aſſiſt the attacked troops; but the young prince, expoſing himſelf too much, was ſlain. The king of Epirus directed his courſe to Argos; but Arcus followed him to that city with a thouſand infantry, and while the Argives engaged the army of Pyrrhus in front, the Spartans attacked them in the rear. By theſe means, the Epirots ſuffered very conſiderably, and Pyrrhus was ſtruck dead with a ſtone. With regard to the character of Pyrrhus, we may obſerve, that Hannibal thought him the greateſt general the world had ever beheld, and that Scipio was only the ſecond. After the death of Pyrrhus, Antigonus reſumed the ſovereignty of Macedon; and now meditated nothing leſs than the reduction of all Greece. He marched an army to Athens; and, notwithſtanding that city was powerfully ſupported by troops from Sparta and Egypt, he compelled it to receive a Macedonian

donian garriſon. But in the midſt of his ſucceſs, he was recalled to the defence of his kingdom againſt Alexander, the young king of Epirus, who had entered Macedon, and committed great depredations: but ambition ſtill led him to purſue new conqueſts. After employing much time in the attempt, he at length made himſelf maſter of the city of Corinth, which was again ſurpriſed and taken from him. He died at the age of eighty years, thirty-four of which he had been king of Macedon. Demetrius ſucceeded his father Antigonus in the year before Chriſt 243. The principal tranſactions of his reign were intended to maintain an intereſt in the Grecian ſtates, not by poſſeſſing the dominion himſelf, but by ſupporting the ſeveral tyrants who had uſurped it. He reigned only ſix years, and was ſucceeded by his kinſman Antigonus.

About this time the republic of Achaia, which had lain for a long time dormant, began to make a very conſpicuous figure, and ſeemed to aim at nothing leſs than the ſovereignty of all Greece. This ſtate was of high antiquity, and conſiſted of twelve towns, which had formed a noted confederacy, called the *Achæan League*.—See the article ACHÆANS, vol. i. p. 66. The republic of Ætolia was, at that time, ſecond in power to Achaia, and formed on the ſame plan. In conſequence of the influx of wealth and diſſipation, Lacedæmon had by this time exchanged poverty and hardy diſcipline for opulence and voluptuous manners. Agis, the Spartan king, endeavoured to reſtore the ancient ſimplicity, to enforce the ſumptuary laws, to cancel all debts, and to make a new diviſion of lands. The people in general reliſhed the propoſals; but the few in whoſe hands the wealth of Sparta centered, oppoſed them; and Agis was at length puniſhed with death, on pretence of attempting a revolution in the government. Such was the ſituation of affairs when Cleomenes mounted the Spartan throne; a prince who poſſeſſed an ardent paſſion for glory, united with great temperance and ſimplicity of manners. In the beginning of his reign he was under the neceſſity of exerting himſelf to ſupport the tottering power of the ſtate. Domeſtic diſtreſs had cauſed an almoſt univerſal deſpondency throughout Laconia, when Cleomenes, actuated no leſs by his natural diſpoſition, than by the repreſentations of the Ætolians, proceeded, in the year before Chriſt 242, to an open rupture with the Achæan ſtates.

The Spartan king attacked and took Tegea, Mantinæa, and Orchomenes, cities in Arcadia. He then marched his army againſt a caſtle in the diſtrict of Megalopolis, which commanded the entrance of Laconia. Immediately after theſe acts of hoſtility, the ſtates of Achaia declared war againſt Sparta. Cleomenes took the field with his troops, which were not numerous, but inſpired with the greateſt ardour for military enterprizes. The Achæans marched againſt him with twenty thouſand infantry and a thouſand horſe, under the command of Ariſtomachus. Cleomenes, with not more than five thouſand troops, offered battle to the enemy. Aratus, being intimidated by the bravery of this proceeding, would not permit the general to hazard an engagement. In conſequence therefore of the retreat of the Achæans, Aratus ſuffered the reproaches of his own troops and the raillery of the enemy; and the Eleans, who had never been the ſteady friends of Achaia, openly declared againſt that republic. Cleomenes afterwards defeated the Achæans in a ſecond encounter; but Aratus, taking advantage even of his defeat, turned his arms immediately againſt Mantinæa, and, before the enemy were aware of his deſigns, made himſelf maſter of that city, which he garriſoned with a body of troops.

Cleomenes would now gladly have come to terms with Aratus; but that politician was immoveable in his deſigns of deſtroying the Spartan authority. As he found, however, that the Achæans could not effect this of themſelves, he entertained the project of calling in the aſſiſtance of Antigonus, king of Macedon, to accompliſh his intentions; a meaſure held in almoſt univerſal odium by the Greeks. Aratus, however, contrived to ſurmount this difficulty; and Antigonus with great pleaſure, in the year before Chriſt 227, embraced the opportunity of interfering in the affairs of Greece. A treaty was agreed on by Aratus and Antigonus, from the conditions of which it was evident that the liberties of Achaia were no more, and that Antigonus was to be the real ſovereign of that country. This tranſaction rouſed the indignation of the whole Peloponneſians, who looked to Cleomenes as the only protector of their liberties. In the mean time Antigonus began his march at the head of twenty thouſand foot and fourteen hundred horſe, and arriving at the iſthmus, encamped over againſt Cleomenes, who had fortified with a ditch and rampart the whole ſpace between Corinth and the Onian hills. Antigonus, not thinking it adviſable to force a paſſage, prepared to decamp and tranſport his troops by ſea to Sicyon. At this critical moment, the Argives having revolted from the Spartans, and joined the enemy, Cleomenes was apprehenſive that the Achæans would attack him in the rear, while the Macedonians aſſaulted his front, and therefore retired with precipitation, firſt to Argos, and then to Mantinæa.

The Achæans now recovered their ſuperiority in Peloponneſus; and Corinth, Tegæa, Mantinæa, Horæa, and Telphaſſa, with many other places, immediately ſubmitted to the combined arms of Macedon and Achaia. Antigonus having ſent his troops into Macedonia during the winter, Cleomenes attacked and took the city of Megalopolis, which was plundered by the ſoldiers, and every thing of value in it demoliſhed. He alſo laid waſte the Argian territories. Antigonus was at that time in Argos with a few mercenary ſoldiers; but though the enemy inſulted him and abuſed the confederates, he could not be prevailed on to engage Cleomenes. In the beginning of the ſummer, however, he advanced into Laconia with an army of twenty-eight thouſand foot, and twelve hundred horſe. Cleomenes had previouſly fortified all the paſſes and avenues into that country with ramparts, and ſent detachments of troops to defend them. He alſo marched himſelf with a body of twenty thouſand foot, and encamped at a paſs called Sellaſia, formed by two hills, the Eva and Olympus. Cleomenes having thrown up an entrenchment at the foot of theſe mountains, poſted the auxiliaries on the eminence of Eva, under the command of his brother Euclidas, while he himſelf, with the reſt of the army, took poſſeſſion of Olympus. Between thoſe two hills ran the river Oenus, along the banks of which the road to Sparta extended.

When Antigonus arrived and viewed the ſituation of the ground, with the mode of defence adopted by the enemy, he was ſenſible that no part could be attacked with any probability of ſucceſs. He therefore encamped at a ſmall diſtance, on the banks of the Gorgulus, which covered part of his army. Cleomenes, reduced to the greateſt diſtreſs for want of proviſions, was under the neceſſity of throwing open his entrenchments, and of engaging the enemy without further delay. The victory remained for a long time doubtful: but at length Cleomenes, receiving intelligence that the forces under his brother were defeated upon the hill, and that his cavalry began to give way on the plain, ſounded a retreat. The overthrow then became general; great numbers of the Lacedæmonians were cut in pieces, and thoſe who found means to eſcape fled from the field of battle in the greateſt confuſion. Cleomenes, with a few horſe, retreated to Sparta, and from thence fled to Egypt, where, not being able to brook the indignities offered him by the miniſters of Ptolemy Philopater, he

poiſoned himſelf. In Cleomenes ended the Herculean race of Spartan kings, if we except the ſhort reign of Agaſipolis.

While Antigonus was abſent in Greece, the Illyrians invaded Macedon with a powerful army. Being, therefore, recalled to the defence of his kingdom, he advanced with his troops againſt the Illyrians, whom he attacked and defeated. Straining his voice, during the engagement, with unuſual vehemence, he burſt a blood veſſel, which occaſioned his death, in the year before Chriſt 221.

Antigonus the ſecond was ſucceeded by Philip the ſon of Demetrius, the laſt of the Macedonian kings of that name. At the time of his acceſſion to the throne, this prince was only in the ſeventeenth year of his age: he was intelligent, affable, munificent, and attentive to the duties of his ſtation. The jealouſy which the Ætolians had for a long time entertained of the Achæan ſtates, was now increaſed by the importance they had aſſumed from their alliance with Macedon. Immediately, therefore, after Antigonus was dead, they ravaged the Achæan coaſt, and committed great depredations on all the neighbouring countries. Aratus attacked them with a very inferior force, and the Ætolians gained a complete victory. The Achæans were, therefore, under the neceſſity of again applying to Macedon, to requeſt the aſſiſtance of the new monarch. Philip promiſed that he would aid them with the whole ſtrength of his kingdom; and accordingly ſoon after ſet out for Greece. He had the vanity, however, to conſider himſelf entitled to the ſovereignty over all Greece; and to accompliſh this end, he determined to effect a junction with the celebrated Hannibal, who at this time waged war againſt the Romans. He ſent commiſſioners to treat with Hannibal, and with the Carthaginian deputies in the camp; when it was agreed that the kingdom of Macedon, and the republic of Carthage, ſhould conſider the Romans as common enemies; that after uniting their arms, and reducing the power of the Roman people, they ſhould purſue their conqueſts in Greece, for the purpoſe of extending the dominions of Macedon.

In vain did Aratus diſſuade Philip from this project. He entered the Ionian gulf with a large fleet, took Oricum, on the coaſt of Epire, and laid ſiege to Apollonia. Here, however, he was ſurpriſed and defeated by the Romans, and retreated homewards acroſs the mountains. The Romans, humbled by the victorious arms of Hannibal, were not in a condition, at that time, to proſecute a war with Macedon; but they determined to raiſe up enemies againſt Philip in Greece. Accordingly overtures were made to the Ætolians, who, confiding in the declarations of the Roman ambaſſador, not only concluded a treaty themſelves, but engaged Sparta and Elis, together with the Illyrians, in the cauſe of Rome. In the year before Chriſt 211, this new war commenced; and the Romans having taken Zacynthus, Æniadæ, and Naſus, reſtored them to the Ætolians. Machanidas the tyrant of Sparta invaded the territories of the Achæans, who ſent a deputation to Philip, to requeſt his aſſiſtance. Philip loſt no time in marching into Greece to defend the poſſeſſions of his allies; and the Ætolians, under Pyrrhus, who was appointed commander that year, in conjunction with king Attalus, advanced to meet him as far as Lamia. A battle enſued, in which the Ætolians and their allies were diſcomfited; and another engagement ſoon after followed, in which Philip gained a deciſive victory. The Macedonian king next marched againſt Elis, which had received an Ætolian garriſon. After plundering the territory, he was attacked by the confederate army, among whom were four thouſand Romans commanded by the proconſul Sulpitius. The battle was long and obſtinate. Here Philopœmen, who led the Achæan horſe, ſtruck dead with his lance the commander of the Ætolian cavalry. Philip, ſeeing his troops give way, ruſhed headlong among the enemies, and was with the greateſt difficulty ſaved by the Macedonians.

Early in the ſpring, Sulpitius and Attalus, quitting their winter quarters, ſailed to Eubœa, and obtained poſſeſſion of Orcum in that iſland. Attalus alſo laid ſiege to the city of Opus in Achaia, which he took; but Philip coming with his army, he retired precipitately towards his ſhips. In the mean time Machanidas, tyrant of Lacedæmon, advanced with a powerful army into Achaia. He could not, however, have choſen a more improper time for his expedition; for Philopœmen was that year created general of the Achæan ſtates. No ſooner was he raiſed to this important office, than he began to re-eſtabliſh military diſcipline among the troops. Having aſſembled his army at Mantinæa, he gave battle to Machanidas. An obſtinate conflict enſued. Machanidas at firſt had the advantage; but purſuing the flying troops too far, Philopœmen attacked him in the rear. He alſo ſtruck Machanidas with a ſpear, and killed him: the death of the tyrant put an end to the battle, in which the Lacedæmonians loſt four thouſand men.

Not long after the death of Machanidas, Sparta groaned beneath the yoke of a ſtill more cruel tyrant called Nabis, who, in addition to the other vices common to tyranny, was actuated by a violent ſpirit of avarice. He baniſhed moſt of the wealthy citizens from Sparta, that he might ſeize their riches; and many he cauſed to be aſſaſſinated. He had received Argos from Philip, in pledge for the money which he had lent that monarch. He there practiſed the moſt ſhocking cruelties. He had invented a machine in the form of a ſtatue reſembling his wife, the breaſt, arms, and hands, of which were full of pegs of iron, covered with magnificent garments. If any one refuſed to give him money, he was introduced to the embraces of this machine, which, by means of certain ſprings, caught faſt hold of him; and the victim, to deliver himſelf from this exquiſite torture, readily granted whatever Nabis deſired.

The Ætolians, thinking themſelves deſerted by the Romans, concluded a peace with Philip. Soon after, Publius Sempronius the proconſul arrived with ten thouſand foot, a thouſand horſe, and thirty-five galleys, to the aſſiſtance of the Ætolians. He was eaſily prevailed on by that people, to agree to an accommodation between the Romans and the king of Macedon. Accordingly a treaty of amity was entered into, in the year before Chriſt 203; and Philip cauſed the king of Bithynia, the Achæans, the Bœotians, the Theſſalians, Acarnanians, and Epirots, to be included in the treaty. The Romans on their ſide named king Attalus, Pleuratus a petty prince of Illyricum, Nabis tyrant of Sparta, the Eleans, Meſſenians, and Athenians. Philip having thus ſettled his affairs at home, and finding that the fortune of the Carthaginians was declining, endeavoured to extend his dominions in the eaſt. He therefore attacked the Rhodians, Athenians, and king Attalus, contrary to the expreſs terms of the treaty. Whereupon, at the requeſt of the Athenians, war was declared againſt him by the Romans, and Sulpitius the conſul appointed to carry it on. The Romans diſpatched a fleet for the relief of Athens, then beſieged by the Macedonians. Diſappointed, therefore, in his purpoſes, Philip laid waſte the whole territory. The command of the Roman army devolving on Titus Quintius Flaminius, that general had the addreſs to detach the Achæans from the Macedonian intereſt. An engagement ſoon after took place near the mountains of Cynocephalæ in Theſſaly, in which Philip was defeated with the loſs of thirteen thouſand men; while the Romans loſt not more than ſeven hundred. The Macedonian king was now obliged to ſue for peace, on

ſuch

ſuch conditions as Rome and her allies were pleaſed to impoſe.

Flaminius having expelled Nabis the tyrant of Sparta from Argos, left Greece to enjoy the liberty and happineſs he had reſtored, and returned to Rome with all the Roman garriſons, in the year before Chriſt 197. The Ætolians were the only Grecian people diſſatisfied with the peace; on account of ſome cities which had been withheld from them. They therefore inſinuated to Nabis the contemptible condition to which he was reduced by the Romans; and that Achaia poſſeſſed all Peloponneſus, while he was permitted to retain Sparta only. Nabis was well inclined to undertake any thing they propoſed againſt the Romans, and therefore immediately laid ſiege to Gitium. Philopœmen, however, cut off his army ſoon after near Sparta, and beſieged the tyrant in that city. Nabis was ſoon after killed by a body of Ætolians, who ſurpriſed Sparta; and that ſtate joined the Achæan league. In the mean while the Ætolians perſuaded Antiochus, king of Syria, to paſs over into Greece, with an intent to expel the Romans from that country. Accordingly he entered Greece with a ſmall force; but being diſappointed of the ſuccours he expected from the Grecian ſtates, was defeated at the Straits of Thermopylæ, by Manlius Acilius Glabrio, the Roman conſul. A deputation was ſoon after ſent from the Ætolians to ſolicit a peace from the Roman people. The conditions of the treaty were extremely hard. They were heavily fined, compelled to give up ſeveral of their cities and territories to the Romans, and to deliver to the conſul forty hoſtages, to be choſen by him, none under twelve, nor above forty years of age.

The Roman ſenate began now to take umbrage at the power and reputation of the Achæan league. Though confederated with Achaia, each of the Peloponneſian cities retained its peculiar privileges, and a ſpecies of independent ſovereignty. After peace had been concluded with Ætolia, and Cephallenia reduced, M. Fulvius Nobilior reſided in that iſland to decide, as he ſaid, any diſputes which ſhould ariſe in Greece, but in fact to improve and foment every diſſenſion for the aggrandiſement of the Roman republic. The general aſſembly of the Achæans had been always held at Ægium; but Philopœmen, who was now at the head of that ſtate, thought fit to divide the honour and advantages of the congreſs among the ſeveral cities of the league, and had appointed Argos for the next diet. But the inhabitants of Ægium oppoſed this regulation, and appealed to the deciſion of the Roman conſul in Cephallenia.

Beſides this, Fulvius had another pretext for paſſing over into Greece. During the tyranny which exiſted in Sparta, many of the Lacedæmonians had been driven into exile, and inhabited the maritime cities of Laconia, protected by Achæan garriſons. Theſe men had cut off the inhabitants of Lacedæmon from all intercourſe with the ſea-coaſt. This reſtraint the Spartans could not brook, and therefore attacked in the night a ſmall city called Las; but were repulſed. Philopœmen repreſented to the aſſembly this attempt as an inſult offered to all Achaia; and a decree was enacted, that the Lacedæmonians ſhould deliver up the authors of that outrage, on pain of being conſidered as enemies. The Lacedæmonians not only refuſed to obey the decree, but put the Achæans to death who were ſent to inform them of it, and then diſpatched ambaſſadors to Fulvius, requeſting him to come and take poſſeſſion of their city. Philopœmen, however, advanced with an army into Laconia, and laid waſte the territories. By the emiſſaries of the Romans too, the Meſſenians had been prevailed on to take up arms againſt the Achæans; and Philopœmen, haſtening to ſuppreſs the inſurgents, fell into their hands, and was put to death. The Romans, by this means, being invited to act as umpires, ſoon found means to deſtroy the ſtrength of Achaia, by ſeducing its confederate ſtates.

During theſe tranſactions in Greece, the Romans were endeavouring to quarrel with Philip king of Macedon, that they might ſeize his poſſeſſions, and deprive him of his power. For that purpoſe they encouraged the cantons or communities, which Philip had lately annexed to his dominions, to aſſert their independence; and commiſſioners being ſent from Rome to ſettle that matter, the king was ordered to content himſelf with Macedon in its ancient ſtate; and by a formal decree was required to withdraw his garriſons from Ænus and Maronea, maritime towns of Thrace. With theſe mortifying conditions Philip was obliged to comply, having no alternative left. Soon after this event, he fell into a deep melancholy, which put an end to his exiſtence.

Upon the death of Philip, Perſeus his ſon aſſumed the government, in the year before Chriſt 179. The firſt meaſures of his adminiſtration were remarkably mild, and he affected a ſtrict regard to juſtice. He aſſumed an air of benignity and gentleneſs. He ſat daily to hear cauſes, and his deciſions were generally made with prudence and diſcernment. The ſame diſpoſition which he diſplayed towards his own ſubjects, he exhibited in his conduct towards moſt of the Grecian ſtates; and at length profeſſed himſelf to be the patron of Greek liberty againſt the pride and dominion of Rome. The Romans, informed of theſe proceedings, diſpatched ambaſſadors to Macedon to queſtion Perſeus as to the authenticity of theſe reports. The king, however, only anſwered with pride and inſolence; and a war commenced. A Roman army was immediately ſent into Greece, under the command of Paulus Æmilius, who drove Perſeus from his intrenchments on the banks of the river Enipeus, and he retired precipitately to Pydna. Here both armies came to a general engagement, and the Macedonians being broken and routed with a great ſlaughter, Perſeus ſurrendered himſelf and his eldeſt ſon Philip into the hands of the Romans. Perſeus was afterwards led in triumph through the ſtreets of Rome, and then caſt into a dungeon, where he famiſhed to death. Philip died before his father; but Perſeus left a ſon named Alexander, who afterwards became ſecretary to the Roman ſenate.

Not long after the annihilation of the Macedonian kings, diſturbances broke out in Achaia, and war was declared againſt Sparta. The Romans ſent commiſſioners to terminate this diſpute. The Achæans, however, were extremely exaſperated againſt the Romans; and the Corinthians particularly diſtinguiſhed themſelves in their oppoſition to the interference of that imperious people. The Bœotians and Chalcidians joined the confederacy. Metellus marched the Roman army againſt them, and obtained a complete victory. He alſo fell in with one thouſand Arcadians, all of whom he put to the ſword. He then marched to Thebes; but moſt of the inhabitants had quitted that city. In the mean time Mummius, the conſul, arrived from Rome with new levies, which increaſed the army to twenty-three thouſand foot, and three thouſand five hundred horſe. With theſe forces he advanced towards Corinth againſt the enemy, who had ſhut themſelves up in that city with fourteen thouſand foot and ſix thouſand horſe, under the command of Diæus. An engagement took place under the walls of Corinth, and the Greeks were defeated; the greater part fled into the town, but in the night withdrew from that place; and Diæus himſelf took refuge in Megalopolis, whither he had before ſent his family. He killed his wife to prevent her from falling into the hands of the enemy, and then took poiſon, of which he died. On the third day after the action, the victorious general entered Corinth; and, with the exception only of the ſtatues and pictures intended for his triumph, gave the town, abounding with all the ornaments of a wealthy metro-

polis, to be plundered by his ſoldiers, in the year before Chriſt 146. The walls were then razed; and the city reduced to aſhes. Thus periſhed Corinth in the ſame year with Carthage.

Ten commiſſioners were now ſent from Rome, to regulate, in conjunction with the conſul, the affairs of Greece in general, and of Achaia in particular; they aboliſhed the popular government in all the cities, and eſtabliſhed magiſtrates, who were to govern each ſtate according to their reſpective laws, under the ſuperintendency of a Roman prætor. Thus the Achæan league was diſſolved, and all Greece reduced to a Roman province, called "the province of Achaia," becauſe at the taking of Corinth, the Achæans were the moſt powerful people of Greece. The whole nation paid an annual tribute to Rome, which the prætor, who was ſent thither every year, had the care of collecting.

Athens continued in the ſame ſtate as the reſt of the Grecian communities, until the Mithridatic war, before Chriſt 88, when that city openly declared againſt the Romans. Mithridates diſpatched into Greece an army of one hundred and twenty thouſand men, under the command of Archelaus; who ſoon made himſelf maſter of Athens, and compelled Lacedæmon, Achaia, and Bœotia, to join him alſo. He took up his abode in Athens. Sylla, being appointed to conduct the war againſt Mithridates, entered Greece with five legions; and all the cities, except Athens, immediately opened their gates to him. He firſt attempted to force his way into the Piræus by ſcaling the walls; but, being repulſed, he had recourſe to the ordinary means of attack. He erected towers; and, raiſing them to the ſame height as the battlements, got upon the ſame level as the beſieged, and plied them with miſſile weapons. Battering engines aſſailed the walls, or with galleries he undermined them; but the defence of the place was equally obſtinate and vigorous; and he was obliged, after many fruitleſs attempts, to turn the ſiege into a blockade, and to wait the effects of famine. Accordingly Athens was at length brought to the laſt extremity; but Ariſtion, the tyrant of the place, expecting no quarter for himſelf from the Romans, would not conſent to capitulate. Sylla, therefore, knowing the weak ſtate of the beſieged, ſtormed and forced the walls with great ſlaughter. Ariſtion ſought refuge in the citadel, but was taken and ſlain. Macedonia and Greece were ſoon afterwards finally reduced under the power of Rome, as were alſo the Grecian provinces in Aſia Minor; and thus, from the year before Chriſt 87, all the republics of Greece were obliged tamely to ſubmit to the arbitrary controul of the Romans, until the eaſtern empire was annihilated by Mahomet II. in the fifteenth century; ever ſince which period that highly diſtinguiſhed and enlightened people have groaned under the oppreſſive tyranny of the Turkiſh government. See the articles ROME, and TURKEY.

CUSTOMS, MANNERS, AND EXALTED CHARACTER, OF THE ANCIENT GREEKS.

Though, in the latter years of Alexander, literature, philoſophy, and the fine arts, diſplayed their brighteſt charms; yet had the ſources from which their beauty flowed, gradually and imperceptibly began to fail: ſo true it is, that in every country where the human genius has attained its higheſt degree of perfection, a principle of degeneracy naturally carries things in a retrograde or contrary direction. The era of the greateſt renown of Greece, is ſtated to have been between the years 479 and 431 before Chriſt. Not only magnanimous and invincible in arms, it was then the peculiar glory of the Greeks, particularly of the Athenians, that during their career of naval and military victories, they cultivated, with a generous enthuſiaſm, the arts which adorn peace as well as war, and improved thoſe decorations of poliſhed life into ſuch perfection as few nations afterwards attempted to imitate, and none aſpired to ſurpaſs. During the adminiſtration of a ſingle man, more works of elegance and ſplendour, more magnificent temples, theatres, and porticoes, were erected within the walls of Athens alone, than could be raiſed during many centuries in Rome, though miſtreſs of the world, by the wealth and labour of tributary provinces. In the ſame period of time, ſculpture attained a ſublimity, from which that noble art could never afterwards but deſcend and degenerate; and a republic hitherto inferior in works of invention and genius to ſeveral of her neighbours, and even of her own colonies, produced, in the ſingle lifetime of Pericles, thoſe ineſtimable models of poetry, eloquence, and philoſophy, which, in every ſucceeding age, the enlightened portion of mankind hath invariably regarded as the beſt ſtandards, not merely of compoſition and ſtyle, but of taſte and reaſon. The progreſs which was thus made in the manners, character, and policy, of the Athenians, was the conſequence of an uncommon exertion of their government, combined with other circumſtances inſeparably connected with their domeſtic and external proſperity. In the courſe of a few years, the ſucceſs of Ariſtides, Cimon, and Pericles, had tripled the revenues, and increaſed, in far greater proportion, the dominions of the republic. The Athenian gallies commanded the eaſtern coaſts of the Mediterranean; their merchantmen had engroſſed the traffic of the adjacent countries; the magazines of Athens abounded with excellent timber, metal, ebony, ivory, and all the materials of the uſeful as well as of the elegant arts; they imported the luxuries of Italy, Sicily, Cyprus, Lydia, Pontus, and Peloponneſus; experience had improved their ſkill in working the ſilver mines of Mount Laurium; they had opened the valuable marble veins in mount Pentelicus; the honey of Hymettus was more eſteemed, in proportion as it became better known to their neighbours; the culture of their olives (oil being long their ſtaple commodity, and the only production of Attica which Solon allowed them to export) muſt have improved with the general improvement of the country in arts and agriculture, eſpecially under the active adminiſtration of Pericles, who liberally let looſe the public treaſure, to encourage every ſpecies of elegant improvement and uſeful induſtry. He alſo found it neceſſary to comply with the extreme paſſion for pleaſure, which then began to enervate his countrymen. The people of Athens, ſucceſsful in every enterpriſe againſt their foreign as well as domeſtic enemies, ſeemed entitled to reap the fruits of their dangers and victories. For the ſpace of twelve years preceding the war of Peloponneſus, their city afforded a perpetual ſcene of triumph and feſtivity. Their dramatic entertainments, to which they were paſſionately addicted, were no longer performed in ſlight unadorned edifices, but in ſtone or marble theatres, erected at great expence, and embelliſhed with the moſt precious productions of nature and of art. The treaſury was opened, not only to ſupply the decorations of this favourite amuſement, but to enable the poorer citizens to enjoy it without incurring any private expence; and thus, at the coſt of the ſtate, to feaſt and delight their ears and fancy with the combined charms of muſic and poetry. The pleaſure of the eye was peculiarly conſulted and gratified in the architecture of the theatres and other ornamental buildings; for, as Themiſtocles had ſtrengthened, ſo Pericles adorned, his native city; and unleſs we had the concurring teſtimony of antiquity, as well as the immortal remains of the Parthenon, or temple of Minerva, which ſtill excite the admiration of travellers, (ſee the article ARCHITECTURE, vol. ii. p. 74,) it would be difficult to believe that in the ſpace of a few years, there could have been created thoſe ineſtimable wonders of art, thoſe innumerable temples, theatres, ſtatues, altars, baths, gymnaſia, and porticoes, which, in the language of ancient panegyric, rendered Athens the eye and light of Greece.

Pericles was indeed highly blamed for thus richly decking one favourite city; but it would have been fortunate for the Athenians if their wealth had not been employed

employed in more periſhing, as well as more criminal, luxury. The pomp of religious ſolemnities, which were twice as numerous and as coſtly in Athens as in any other city of Greece; the extravagance of public entertainments and banquets, which on ſuch occaſions always followed the ſacrifices; the increaſe of private luxury, which naturally accompanied this profuſion, alike contributed to exhauſt the reſources, without augmenting the glory, of the republic. Dramatic entertainments formed an eſſential part of the ſolemn feſtival conſecrated to Minerva, who had given her peculiar protection to the city of Athens. Jupiter enjoyed his appropriated honours; but more commonly, as is atteſted by Athenian medals, the worſhip of the father of the gods was aſſociated with that of his warlike daughter; and with the myſteries of Ceres, who taught the Athenians the valuable knowledge of agriculture, which they were ſuppoſed to have diffuſed over the ancient world. It would be endleſs to mention the inſtitutions in honour of the crowd of inferior divinities, which rendered the feſtivals at Athens twice more numerous than in any other Grecian city. Nor did the frequency abate the extenſive ſplendour which accompanied them. The ſhops and courts of juſtice were ſhut; the mechanic quitted his tools, the huſbandman ceaſed from his labours, the mourner intermitted his ſorrow. The whole city was diſſolved in feaſting and joy; the intervals of which were filled up by pompous ſhows and proceſſions, by concerts of muſic, by exhibitions of painting; and at ſeveral feſtivals, particularly the Panathenæan, by hearing and judging the nobleſt productions of eloquence and poetry.

It ſeems indeed extraordinary, that the revenues of Athens, notwithſtanding their improvement by Pericles, ſhould have ſufficed for this multitude of expences. But we muſt conſider that the general ſimplicity of manners in private life, formed a ſtriking contraſt with the extravagance of public feſtivals and amuſements. The houſes and tables of the moſt wealthy Athenians were little diſtinguiſhed above thoſe of their pooreſt neighbours. Pericles himſelf, though never ſuſpected of avarice, lived with the exacteſt œconomy; and the ſuperabundance of private wealth, which would have created envy and danger to the owner, if he had employed it for his particular convenience and pleaſure, procured him public honour and eſteem, when expended for the gratification of the multitude; and, in general, diſtinguiſhed obſequies at his death.

To perform the funeral rites was conſidered ſo ſacred, that they who neglected to diſcharge this office, were thought accurſed. They believed that their ſouls could not be admitted into the Elyſian ſhades, till their bodies were depoſited in the earth; and if theſe rites were altogether omitted, that they would be excluded for an hundred years. (*Homer. Odyſſ.* λ. *v.* 66, 72.) Hence, of all the curſes, that was the greateſt, that a perſon might die without the honours of burial: and of all deaths, that by ſhipwreck was deemed the moſt terrible; ſee p. 892. Thus, if they were in danger of being caſt away, it was uſual to faſten the moſt valuable ſtores round their middle, with a direction to thoſe who might find the body, if it ſhould be caſt upon ſhore, to give them human burial, and offering their ſtores as a compenſation for the trouble. In any caſe, it was conſidered not only an act of the greateſt inhumanity to neglect to perform theſe offices, but a crime ſufficient to provoke the vengeance of the infernal gods. He who thus offended was deemed profane and polluted, till he had ſubmitted to the accuſtomed purifications, and appeaſed the incenſed gods. It was not required, in all caſes, that the ſolemnities ſhould be ſtrictly performed; for if a traveller was in unuſual haſte, it was ſufficient to caſt three handfuls of ſoft earth upon the carcaſe, one of which was to be thrown upon the head. If the body of any perſon had been interred in haſte, and it was afterwards found by any of his friends, it was honoured with a ſecond funeral. (*Virg. Æn.* 3. *v.* 62 *and* 67.) It was thought to be a great misfortune, if their bodies had not been prepared for burial by their relations, and interred in the ſepultures of their family. The aſhes of thoſe who died in a foreign country were uſually brought home, and interred in the ſepulchre of their anceſtors. This pious care of the bodies of their dead was extended alſo to ſlaves; and was eſteemed ſo neceſſary, that the candidates for the magiſtracy at Athens were examined, as to the due celebration of the funerals, and proper care of the monuments, of their relations. It was alſo a grievous crime to be gay and cheerful before the uſual time of mourning expired. The perſons of the prieſts who officiated at funerals were highly reſpected, and their goods were regarded with religious veneration. (*Plutarch. Græc. Quæſt.* 21.)

There were ſome crimes, however, which were ſo heinous, as to prevent the perſons guilty of them from all rites of burial. Public or private enemies were deemed unworthy of partaking of this privilege. (*Homer Il. v.*) Thoſe who were conſpirators or traitors to their country, were excluded from the rites of burial; thoſe who refuſed to act in defence of their country in times of extremity; tyrants, who were pronounced enemies to their country; perſons guilty of ſuicide; and perſons guilty of ſacrilege, were threatened with this puniſhment. Perſons, killed by lightning, were buried apart by themſelves, being thought hateful to the gods; or left in the place where they died. Some ſay, they had no interment, but were ſuffered to rot where they fell, which was hedged in to prevent others from contracting pollution from it; as were all places which had been ſtruck with thunder. Thoſe who waſted their patrimony were denied the right of being buried in the ſepulchre of their fathers. The bodies of thoſe who died in debt belonged to their creditors, and were refuſed burial, till ſatisfaction was made. Some criminals who ſuffered capital puniſhment were deprived of burial; thoſe who died upon the croſs or were impaled, were allowed frequently to be devoured by birds or beaſts of prey. If the carcaſe was ſpared by the beaſts, it commonly remained upon the croſs till it was putrified. In ſome places it was uſual to inter the bodies of infants who had no teeth, without conſuming them to aſhes. If thoſe who had incurred public hatred had obtained the rites of burial, it was uſual to leap upon their tombs, and to caſt ſtones at them, in token of their abhorrence. They frequently dragged ſacrilegious perſons from their graves, after they had been decently interred. Traitors, who had been buried, were again taken from their tombs; and the bones of tyrants were ſeldom ſuffered to reſt in the grave. (*Plutarch. Dione. Euripid. Med.* 1378.)

Yet, amidſt all theſe attentions to perſons deceaſed, and amid this refinement in taſte and ſplendour, the character and condition of the Grecian women preſent the moſt ſtriking contraſt of any to be met with in hiſtory. If we knew not the conſideration in which the fair ſex were anciently held in Greece, and the advantages which they enjoyed at Sparta, after the laws of Lycurgus had revived the inſtitutions of the heroic ages, we ſhould be apt to ſuſpect that the ungenerous treatment of the feebler ſex, which afterwards ſo univerſally prevailed, had been derived from the Egyptian and Aſiatic colonies, which early ſettled in that part of Europe. Excluded from ſocial intercourſe, which nature had fitted them to adorn, the Grecian women were rigorouſly confined to the moſt retired apartments of the family, and employed in the meaneſt offices of domeſtic drudgery. It was thought indecent for them to venture abroad, unleſs to attend a proceſſion, to accompany a funeral, or to aſſiſt at certain other religious ſolemnities. Even on theſe occaſions, their behaviour was attentively watched, and often malignantly interrupted. The moſt innocent freedom was conſtrued into a breach of decorum; and their reputation, once ſullied by the ſlighteſt imprudence, could never afterwards be retrieved.

trieved. If ſuch unreaſonable ſeverities had proceeded from that abſurd jealouſy which ſometimes accompanies a violent love, and of which a certain degree is nearly connected with the delicacy of paſſion between the ſexes, the condition of the Grecian women, though little leſs miſerable, would have been far leſs contemptible. But the Greeks were utter ſtrangers to that refinement of ſentiment, which, in the ages of chivalry, elevated the character of the ſofter ſex almoſt to the rank of divinities. See the article CHIVALRY, vol. iv. p. 506. Married or unmarried, the Grecian females were kept in equal reſtraint; no pains were taken to render them, at any one period of their lives, agreeable members of ſociety; and their education was either entirely neglected, or confined to ſuch humble objects, as, inſtead of elevating and enlarging the mind, tended only to narrow and to debaſe it. Though neither qualified for holding an honourable rank in ſociety, nor permitted to enjoy the company even of their neareſt relations, they were thought capable of acting as ſtewards for their huſbands, and thus relieving men from a multiplicity of little cares, which ſeemed unworthy of their attention, and unſuitable to their dignity. The whole burden of ſuch mercenary cares being impoſed on the women, their firſt inſtructions and treatment were adapted to that lowly rank, beyond which they could never afterwards aſpire. Nothing was allowed to divert their minds from thoſe ſervile occupations in which it was intended that their whole lives ſhould be ſpent; no liberal idea was preſented to their imagination, that might raiſe them above the ignoble arts in which they were ever deſtined to labour; the ſmalleſt familiarity with ſtrangers was deemed a dangerous offence; and any intimacy or connection beyond the walls of their own family, a heinous crime; ſince it might engage them to embezzle the furniture and effects committed to their care and cuſtody. Even the laws of Athens confirmed this miſerable degradation of women, holding the ſecurity of the huſband's property a matter of greater importance than defending the wife's perſon from outrage, and protecting her character from infamy. By ſuch illiberal inſtitutions were the moſt amiable part of the human ſpecies inſulted, among a people in other reſpects the moſt enlightened of all antiquity. They were totally debarred from thoſe refined arts and elegant entertainments, to which their agreeable qualities might have added a new charm. Inſtead of directing the taſte, and enlivening the pleaſures of ſociety, their value was eſtimated, like that of the ignobleſt objects, merely by profit or utility. Their chief virtue was reſerve, and their point of honour œconomy.

This extreme depreſſion of the women levelled the natural inequalities of their temper and diſpoſition; the prude, the coquette, with the various intermediate ſhades of female character, diſappeared; and all the modeſt and virtuous part of the ſex (if virtue and modeſty can ever be the effects of reſtraint) were reduced to humble imitation and inſipid uniformity. But, in the time of Pericles, there was introduced at Athens a bolder claſs of females, who diveſted themſelves of natural modeſty, diſdained the artificial virtues, and avenged the violated privileges of their ſex. Aſia, the mother of voluptuouſneſs, produced this ſeductive brood, whoſe meretricious arts and occupations met with no reſtraint from the laxity of Ionian morals, and were even promoted and encouraged by the corruptions of Pagan ſuperſtition. In moſt of the Greek colonies of Aſia, temples were erected to the *earthly* Venus; where courtezans were not merely tolerated, but honoured as prieſteſſes of that condeſcending divinity. The wealthy and commercial city of Corinth firſt imported this innovation from the Eaſt; and ſuch is the extravagance of the human mind, that after the repulſe of Xerxes, the magiſtrates of that republic aſcribed the ſafety of their country to the powerful interceſſion of the votaries of Venus, whoſe portraits they cauſed to be painted at the public expence, as the Athenians had done thoſe of the heroic companions who gained the battle of Marathon. The fame of all thoſe accompliſhed but frail beauties, though highly celebrated by the poets and hiſtorians of the times, was eclipſed by the ſplendour of Aſpaſia of Miletus, who ſettled at Athens under the adminiſtration of Pericles, and is ſaid to have embarked in the fleet with which that fortunate commander ſubdued the wealthy iſland of Samos. The perſonal character of Aſpaſia gave temporary luſtre to a profeſſion, which, though exalted by the caſual caprices of ſuperſtition, muſt naturally have fallen into contempt, ſince later writers among the Greeks acknowledge, that though ſhe carried on a very diſhonourable commerce in female virtue, yet her wit and eloquence, ſtill more than her beauty, gained her extraordinary conſideration among all ranks in the republic. The ſuſceptible minds of the Athenians were delighted with what their abſurd inſtitutions rendered a novelty, the beholding the native graces of the ſex, embelliſhed by education. Aſpaſia is ſaid to have acquired a powerful aſcendant over Pericles himſelf; ſhe certainly acquired his protection and friendſhip; which is leſs extraordinary than that her converſation and company ſhould have pleaſed the diſcernment of the ſage Socrates. She is accuſed of having excited, from motives of perſonal reſentment, the war of Peloponneſus; yet, calamitous as that long and obſtinate conflict proved to Greece, and particularly to Athens, it may be ſuſpected that Aſpaſia occaſioned ſtill more incurable evils to both. Her example, and ſtill more her inſtructions, formed a ſchool of proſtitution at Athens, by which her dangerous profeſſion was reduced to a ſyſtem. The companions of Aſpaſia ſerved as models for painting and ſtatuary, and as themes for poetry and panegyric. Nor were they merely the objects, but the authors, of many literary works, in which they eſtabliſhed rules for the behaviour of their lovers, particularly at table; and explained, according to Athenæus, the art of gaining the heart, and captivating the affections. The dreſs, behaviour, and artifices, of this claſs of women, became continually more ſeductive and dangerous; and the metropolis of Greece thenceforth remained the chief ſchool of vice and pleaſure, as well as of literature and philoſophy. It has indeed been lamented that the fine arts, and particularly painting, ſhould have been thus proſtituted to the honour of harlots, and the purpoſes of voluptuouſneſs. Licentious pictures too are mentioned by ancient writers as a general ſource of corruption, and conſidered as the firſt ambuſh that beſet the ſafety of youth and innocence. Yet this unhappy effect of the arts was only the vapour that attends the ſun; ſince painting, architecture, and above all, ſtatuary, attained their meridian ſplendour in the age of Pericles; and ſhed peculiar glory on this period of Grecian hiſtory, not only by the powers of genius which they diſplayed, but by the noble and elegant purpoſes to which they were directed.

Of the doubtful and delicate problem, "Whence aroſe theſe pre-eminent attainments of the Greeks?" M. Herder, in his *Philoſophy of Man*, has offered the following ſolution: He regards as preliminary cauſes the acceſſible nature of their country, which occaſioned frequent migrations into it, and which gave riſe to conſtant intercourſe with ſtrangers: the cultivated ſtate of Aſia Minor, whence, at ſucceſſive periods, Greece was peopled: the numerous diſtinct tribes into which the ſeveral iſlands, and the marked features of the main land, occaſioned this people to be divided: the ſcope for emulation, imitation, and improvement, which a ſociety ſo diverſified afforded, a fine ſtructure of frame, the developement of the powers of which was aſſiſted by ſingular felicity of climate; and a paſſionate love of ſenſible beauty in arts and manners, in ſcience, and in political inſtitutions. In their exquiſite organs, faſhioned under a mild ſky, in their enthuſiaſtic attachment to muſic,

muſic, and in the well-directed efforts of various tribes to the ſame object, he attributes the cauſes of the ſuperiority of their beautiful and copious language.—See the article LANGUAGE. The topics of popular faith, the tales of tradition, and the expoſitions of natural appearances delivered by their ſages, blended together and worked up by lively imaginations, he conſiders as the ground-work of their elegant mythology; while their native vivacity diſpoſed them ſo ardently to love muſic, the dance, pantomime, and the drama.

Their arts, he thinks, originated in their religion and their political inſtitutions; the former requiring ſtatues and temples, and the latter demanding monuments and public edifices. Their quarries yielded the Parian marble, and their traffic furniſhed them with ivory and braſs: they imbibed a taſte for luxury from their kindred of Ionia and Magna Græcia; while their mediocrity of means weaned them from oriental magnificence, and diſpoſed them to ſtudy the charms of ſimplicity. In their climate, the light and elegant ſtyle of architecture was alſo the convenient one.—The colliſion of individuals ſo oppoſite in manners and habits, as the refined Athenian and the rude Arcadian, the luxurious Ionian and the ſequeſtered Epirot, the auſtere Spartan and the effeminate Sybarite, could not fail, he conceives, to call forth the active powers of the mind, and to fertilize the invention.

The religion of Greece conſecrated hoſpitality, protection to fugitives, and the inviolability of holy places; it repreſented an awful vengeance as hanging over the head of the murderer, it upheld the ſanctity of oaths, and it conſidered the domeſtic hearth as an altar, and the receſs of the dead as a temple. The oracle of Delphi reproved tyrants, aided the labours of virtuous ſages, favoured beneficial inſtitutions, gave authority to moral principles, hallowed the duties of the citizen, and gave efficacy to that ſingular tribunal of Greece, the council of the Amphictyons.—Manly games rendered youth healthy, robuſt, handſome, and active, while they kindled in them a love of their country, a public ſpirit, and even the deſire of poſthumous fame; and they gave riſe to a diſintereſted and heroic friendſhip, which nothing but death could diſſolve. Like the untutored children of nature, only the gentleſt bands united the different tribes of this people: there were no others than a religion, a language, oracles, games, a council of Amphictyons, a deſcent, the inheritance of ancient fame, and the reputation of early exploits, which belonged to them in common. Their popular governments, though certainly not the beſt for all purpoſes, yet incredibly advanced the human mind, and produced a maſs of population more enlightened than any on which the ſun has ever ſince ſhone. Thus, amid the tranquillity of enterpriſing and rival ſtates, the ſons of Greece rendered conſpicuous their ſuperior ability, by the ſucceſsful proſecution of the rigid ſciences. The period of their independence laſted long enough to allow the human mind to reach the higheſt pitch of excellence, to which culture, under circumſtances the moſt favourable and operating on ſubjects the beſt calculated, is capable of raiſing it.—That this aſſertion is founded in truth, ſeems to be confirmed by our increaſing admiration of the yet remaining though mutilated works of the Greeks, whoſe pre-eminence in the fine arts has hitherto ſtood unrivalled and undiſputed; and it is a fact, however humiliating to modern efforts, that the greater the artiſt of our own times, the more enthuſiaſtic are his encomiums on the taſte and ſuperior ability of the ancient Greeks.

With reſpect to the efficiency of the ſeveral forms of government among the Grecian ſtates, many contrary opinions have at different times prevailed. The two principal conſtitutions, and from which moſt of the ſubordinate ſtates of Greece copied or legiſlated for themſelves, were the ariſtocracy of Sparta, and the democracy of Athens. That of Sparta, though nominally a republic, was in reality a mixed government, conſiſting of two hereditary kings, a ſenate of members elected for life, and five principal magiſtrates called ephori; as already ſtated in our account of the legiſlation of Lycurgus. One of the leſſons forcibly impreſſed by this government was, "*that innovation was a great evil*;" and ſuch was the effect of this principle, and of the judicious balance of the ſtate, that for upwards of four hundred years not a ſingle ſedition is ſaid to have diſturbed its internal tranquillity.

The democratical form of government given to Athens by Solon, has generally been deemed much inferior to that given to Sparta by Lycurgus; yet the fact has been conteſted by different writers. M. Lauliette, in his *Eſſai ſur les Grecques*, publiſhed in 1805, not only attributes the ſuperior talents and genius of the Athenians to their democratical form of government, but alſo their progreſs in the arts, and their invincible courage in arms. "A democratical government, (he obſerves,) is propitious to talents of all kinds; it exalts all the paſſions; it forces men to ſhew themſelves, with all their virtues and their faults, greedy of power, and capable of ſacrificing every thing to independence. Wherever man is found in a ſtate of perfect liberty, he is in the vicinity of the extremes of virtue, and of the extremes of corruption. He then diſplays no mediocrity either of good or evil. In this ſtate, ſo favourable to the developement of his faculties, he fears no reſtraint, he forms the boldeſt projects, and there is no point, however elevated, which he does not wiſh to attain."

In oppoſition to the doctrine of this French hiſtorian, our countryman Dr. Biſſet aſſerts, that the excellent laws which Solon formed for the Athenian democracy, were not the conſtitution which he thought the beſt, but which he thought them moſt diſpoſed to bear. He then proceeds to ſhew, by the fate of Solon's conſtitution, that, where power is not divided and checked, the government muſt ſoon be overturned; and that in democracies the people are not more exempt from the danger of being duped and enſlaved by their own creatures, than abſolute monarchs are of being miſled by their favourites. The ingratitude of the Athenians towards Miltiades, Ariſtides, Themiſtocles, Cymon, and Pericles, and their ſhameful treatment of many of their moſt virtuous citizens, he traces up *to the nature of their government as their genuine ſource*; he aſcribes them to the genius of their conſtitution, and not to any depravity of character in the people themſelves. Nor will he allow that the valour or gallant reſiſtance of the Athenians, to the torrent poured on Greece by Perſia, was the reſult of the natural energy of democratic government: and he illuſtrates his aſſertion by ſhewing that other ſtates, by no means democratic in their conſtitutions, have often diſplayed not leſs energy and not leſs bravery than the Greeks in many of their wars.

"Where men have great intereſts at ſtake, (ſays Dr. Biſſet,) whatever be their form of government, they fight ſtrenuouſly. The government of Scotland was certainly far from democratical, when Sir William Wallace, with his ſmall band, long ſucceſsfully oppoſed the invaders of his country. Theſe were not Aſiatics, relaxed by climate, and enfeebled by luxury, but from a country which has always produced ſoldiers, to whom the world never ſaw ſuperiors: they were Engliſhmen. They were headed not by an oſtentatious eaſtern deſpot, but by one of the braveſt and wiſeſt of Engliſh kings. The efforts of England againſt the Spaniſh Armada, containing infinitely better troops than the Perſian fleet, were not leſs wiſe nor leſs vigorous than thoſe of the Athenians. A general ſpirit prevailed of fitting out ſhips, and going to combat the enemy. Our admirals availed themſelves no leſs of ſuperior ſeamanſhip, and ſuperior knowledge of the ſeas adjoining our coaſts, than did Themiſtocles. In Holland, when

the Dutch government was not democratical, the efforts of William III. and his countrymen, againſt the invading power of Louis XIV. were equally energetic with thoſe of the Athenians; and againſt troops to which the Perſians were as much inferior as their commanders, Mardonius and Xerxes, were to Turenne and Condé. Soldiers have generally fought beſt when attached to their ſuperiors. The German retainer, we are told by Tacitus, exerted himſelf with the moſt uncommon vigour, when fighting under the eye of his chief. Never did the Scotch highlanders, eminent as they have been at all times for their proweſs, fight with more energy, than under the chiefs of their reſpective clans. In fact, European ſoldiers generally fight bravely, whatever be their cauſe. Never did the Athenians exert themſelves more forcibly than the Macedonians when fighting under their king. Never did the efforts of any democracy exceed thoſe of the Spaniards under the prince of Parma, of the Turks under Solyman, of the Ruſſians under Romanzow, of the Auſtrians under prince Eugene, of the Pruſſians under Frederic the Great, and of the Britiſh under all commanders. Thus we ſee the opinion that democracy produces greater military exertions than any other government, is totally unfounded. In reality, the exertions of the Athenians, ſo far from ariſing from their democracy, was owing to a temporary departure from its ſpirit. By the Athenian conſtitution there were ten generals. Conſiſtently with their loved equality, each of theſe commanded in turn. At the battle of Marathon, the command was conferred on Miltiades alone; and here the democracy of inſtitution, in the time of danger, gave way to the ariſtocracy of nature. Ariſtides and Themiſtocles, during the ſecond Perſian war, were really princes: eſpecially the laſt. The Athenians acted according to the will of Themiſtocles, not Themiſtocles according to the will of the Athenians. Themiſtocles led the people from Athens to the ſhips; forced them to remain in the ſtraits of Salamis, and fight; drove Xerxes from Greece; fortified the Pyræus; increaſed the population, riches, and power, of Athens; and finally raiſed his country to the firſt ſtation in Greece. Had the Athenians, inſtead of ranging themſelves round the ſtandard of a leader, following his counſel, and obeying his orders, thought and acted for themſelves; had they in all theſe emergencies continued democratical; they would have become a province of Perſia. Acting for a time as ſubjects to a wiſe prince, they were eminently ſucceſsful; but on returning to their uſual democracy, they ungratefully doomed their benefactor to ruin. Not only wars of rapine and bloodſhed, continues this author, but ambition, injuſtice, and cruelty, are inherent in the very nature of a conſtitution purely democratical." But Dr. Biſſet muſt allow that wars of ambition, conqueſt, and injuſtice, have been begun by governments that were *not* purely democratical, nor purely monarchical; that even mixed governments have ſometimes without provocation, or the ſhadow of right, invaded the territories of other ſtates, depoſed ſovereigns, ſyſtematically purſued plans of aggrandizement, and ſometimes diſgraced wars that were in themſelves juſt, by the moſt ſhocking cruelties: of the former we have the ſtrongeſt evidence in the extent of the Britiſh empire in India; of the latter, in the maſſacre of Glencoe, and the bloody progreſs of the Engliſh army in Scotland after the battle of Culloden; and of both, in the wars of rapine and plunder ſo ſucceſsfully carried on by Bonaparte.

To the democratical form of government is attributed the levity, fickleneſs, and injuſtice, of the Athenians towards Alcibiades, in trying and condemning him unheard. Unfortunately, our own hiſtory, notwithſtanding the mixture of our government, records but too many inſtances of fickleneſs, and of the injuſtice of condemning perſons to death without a hearing. The attainders by act of parliament of queen Ann Boleyne, of Cromwell earl of Eſſex, and of various others, without ſo much as the formality of an appearance at the bar, will ever atteſt the melancholy truth that barefaced injuſtice is not alone confined to democratic ſtates. A perfect democracy, however, is too often diſtinguiſhed by a total diſregard of juſtice in judicial proceedings. "Every day, (ſays Dr. Biſſet,) afforded ſome inſtance of unjuſt ſentence, and unmerited acquittals, in the general aſſembly of Athens. Thoſe real patriots, who dared to ſpeak plain and bold truths, were impriſoned or put to death, while the demagogues, who flattered their vices and folly, though really bribed by their enemies, were held in the higheſt honour. Even private cauſes, in which the populace at large might not be ſuppoſed to be ſo much intereſted, were decided according to the whim of the people, or the popularity of the advocate who undertook the cauſe; and thus eventually was brought on the diſgrace and ruin of the ſtate."

A ſhocking inſtance of the blind fury of a democratical government, is recorded in the annals of Carthage. It was the intention of Alexander, had he lived, to have entirely deſtroyed the commerce of a nation ſo intimately connected with the Tyrians; and the magnitude of the deſign was worthy of the ſon of Philip. A thouſand galleys, on the return of the Macedonian monarch, would have ſailed from Alexandria throughout the Mediterranean; nor would the ſubjugation of Carthage have been deemed complete, until the whole of the adjacent coaſts, both of Africa and Spain, had acknowledged Alexander as their ſovereign. A broad and regular road for the convenience of commerce, was to have extended along the conquered line of coaſt, to Ceuta and Tangier; whilſt the eſtabliſhment of arſenals, havens, and dock-yards, at proper intervals, would have diſplayed the naval ſupremacy of Macedonia. Theſe deſigns of Alexander were in part ſuſpected by the Carthaginians, who accordingly employed the addreſs of Hamilcar to avert the impending ſtorm: but the report of their ambaſſador ſerved only to confirm their apprehenſions. On his arrival in Egypt, Hamilcar beheld with aſtoniſhment the riſing metropolis of eaſtern commerce: the alarm was quickly conveyed to Carthage; and the trembling meſſenger, who bore this unwelcome intelligence, was ſacrificed to the puſillanimous agitation of an ungovernable and ferocious democracy.

The regulations, as well as progreſs, made by the Greeks in military and naval tactics, and in the co-operation of their fleets and armies for the purpoſes of attack and defence, are the firſt on record which eminently diſtinguiſh any of the nations of antiquity. Mr. Clarke, in his Progreſs of Maritime Diſcovery, recently publiſhed, has ſhewn that in a Grecian fleet, the principal officers varied but little from the modern liſt; though naval and military duties were too much blended with each other. The *commander of the troops* appears to have preceded the *admiral*; of which rank, the Greeks had uſually from one to three officers in a ſquadron: yet ſuch was the prejudice, or jealouſy, of the times, that when an admiral had once diſcharged the important duties of that illuſtrious ſtation, he was ever afterwards deemed by the Spartans incapable of occupying the ſame rank. His title as commander of a fleet was *dux præfectuſque claſſis*. To the admiral ſucceeded the captain (*navarchus*), and then followed a poſt of great honour and reſponſibility, the pilot (*gubernator*), to whom the charge of the veſſel and the diſcipline of its crew were aſſigned. Under the pilot was appointed a ſort of mate called *proreus*, from his ſtation at the prow; he had the keeping of ſtores for the ſhip's rigging, and was allowed to diſtribute places to the rowers. Commanders of galleys, in addition to the above title of *navarchus*, or captain, were ſtyled *trierarchs*; and, when two were on-board, each commanded for ſix months.

This

This appellation of trierarchs was alſo given to thoſe cities, that in time of war were appointed to fit out galleys. The modern boatſwain is diſcovered in thoſe duties which the *keleuſtes* of the Greeks performed; he paſſed the word of command throughout the veſſel, and alſo aſſiſted in diſtributing the ſhip's allowance of proviſions. The appointments of purſer and ſecretary were always united, as they ſometimes are at preſent; and the ſprightly notes of the drum and fife, by which the labour of the capſtan-bar is at preſent ſo much abated, was a delightful taſk aſſigned to the Grecian *trieraules*, who ſtood before the maſt, and cheered his weary ſhipmates with the exhilarating muſic of the Canaanites:

Againſt the maſt the tuneful Orpheus ſtands,
Plays to the weary'd rowers, and commands
The thought of toil away! *Statius*, v. 343.

Whilſt on-board, the hardſhips which the Grecians endured, muſt have been conſiderable, from the ſmallneſs of their veſſel, and the badneſs of its accommodations. The rowers had only a wooden bench to repoſe on, and even the ſituation of their officers differed but little from the reſt of the crew; ſince it was objected againſt Alcibiades, as a mark of great effeminacy, that he was the firſt Grecian who had ordered his bed to be ſlung, in order to break the motion of the veſſel. The crew was divided into rowers (*remiges*), mariners (*nautæ*), and the ſoldiers, or marines, who were ſtyled *claſſiarii*. The rowers were again ſubdivided into the lower rank called *thalamitæ*, the middle *zugitæ*, and the uppermoſt *thranitæ*. Thucydides adds that the latter were paid the beſt, becauſe they worked a heavier oar. A ſhip's complement rarely exceeded two hundred; the uſual pay of their ſeamen was three oboli a day; and if we add the fourth, that was given by Cyrus at Lyſander's requeſt, it would amount on the whole to nearly ſixpence halfpenny. This however was ſometimes raiſed to a drachma, or about ninepence, though ſome authors make it leſs; as when the Athenians fitted out a fleet againſt Sicily.

In military ordinations, the Grecian armies chiefly were formed of free denizens. At the age of eighteen, the Athenians were appointed to guard the city, with its forts; at twenty they were ſent to foreign wars; and the Spartans, at thirty. At threeſcore, they were allowed to retire. At Athens, no one, above forty years of age, unleſs in a time of danger, was obliged to ſerve in war. The keepers of the revenue, and thoſe who danced at the feſtival of Bacchus, were exempted; ſlaves were alſo excluded from ſerving; and all who ſerved were regiſtered. The early Grecians were appointed by lots; the ſoldiers always maintained themſelves; none, but thoſe exempted by law, were allowed to abſent themſelves from ſervice, upon pain of loſing the rights of citizens, and of excluſion from the public temples. If they made their eſcape, they were branded with marks in their hands called σιγματα, to diſtinguiſh them from ſlaves who were marked on their foreheads. The Carians were the firſt who ſerved for pay; hence the terms καρικοι, and καριμοιροι, are uſed proverbially for cowards. *Heſychius.*

The Grecian armies were compoſed of different ſorts of ſoldiers. Their main body conſiſted of foot-men; the reſt were carried on chariots, horſes, or elephants. The foot-ſoldiers were at firſt of three ſorts; 1. Οπλιται, who bore heavy armour, and engaged with broad ſhields and long ſpears. 2. Ψιλοι, light-armed men, who fought with arrows and darts, or ſtones and ſlings; they were inferior to the heavy-armed ſoldiers. When they had ſhot their arrows, they retreated behind the ſhield of the heavy-armed ſoldiers. 3. Πελταϛαι, were armed with ſhields and ſpears, but of leſs ſize than thoſe of the οπλιται. The horſemen were not at firſt numerous, being thoſe only who could maintain themſelves; and who afterwards provided ſubſtitutes to ſerve for them. Their manœuvres in the field of battle were regulated with ſcientific preciſion; and their modes of forming for attack and defence were founded upon the moſt perfect principles of human ſagacity.

Thus in arms, as well as in arts, the Greeks excelled all their contemporaries; and it afforded matter of aſtoniſhment to the Romans, on their firſt appearance in Greece, to find a people ſo far before them in all the attainments of political and civilized life. With them the brilliant epoch of the polite arts, was alſo that of the belles-lettres. The poets and the orators of Greece co-operated with her painters, ſculptors, and ſtatuaries, in bringing to perfection the higheſt attainments and productions of human excellence; while her philoſophers and legiſlators regulated the commonwealth; and her heroes bled in its defence. During this period of Grecian glory, all that was great in man, all that contributed to exalt his powers, and to kindle every ſpark of talent, was cheriſhed by the moſt happy combination of events,—by a combination which very rarely occurs in the hiſtory of the world. Yet ſuper-eminent as was once the meridian glory of the Grecian people, their declination was proportionally rapid. Deſtitute of immediate and important objects to rouſe their activity, the example of their anceſtors ſoon ceaſed to animate and inſpire them. The rewards and incentives to merit being withdrawn, men no longer aſpired at excellence. The ſpirit of patriotiſm vaniſhed; the fire of genius was extinguiſhed; exertion periſhed with hope; and Greece, from the age of Alexander, is deſtitute of any tranſactions highly memorable either in arts or in arms.

PRESENT STATE OF MODERN GREECE.

This country, which has conferred ſo much honour on humanity, is now ſcarcely viſible among nations; and the luminary, which once enlightened her, ſeems to have ſet for ever. Rome has been more fortunate; ſhe has riſen from her ruins, and has obtained a ſecond exiſtence almoſt as brilliant as the firſt. She does not indeed preſent in modern times the majeſtic and ſtriking ſpectacle of a free and conquering people, nor a ſenate formidable to her citizens and to the world: but the genius of her ſovereigns long procured for her a domination not leſs extenſive than that which ſhe formerly enjoyed. The pomp of the Vatican, and the temple of the apoſtle of Chriſtianity, have in ſome degree eclipſed the majeſty of the Pantheon and the palace of the Cæſars. Italy has ſeen *chefs-d'œuvre* ariſe on the remains of thoſe of antiquity, and her harmonious lyres have revived the aſhes of Horace and of Virgil: but Greece has never recovered the happy privilege of enlightening and charming her people; and barbarians now trample over and diſgrace that claſſic ground. The ſectaries of Iſlamiſm, incapable of the efforts of creative genius, have almoſt effaced the very traces of the glory of Athens; brutiſh and miſerable ſlaves, without thought, and in ſtupid ignorance, walk over the auguſt theatres on which Sophocles and Euripides diſputed the tragic palm—on which Æſchines and Demoſthenes ſhared the triumphs of eloquence, and Plato and Ariſtotle aſſumed the glory of enlightening mankind.

The iſles have endured the ſame fate in which the continent has been involved; the ſame yoke is impoſed on Rhodes, ſo celebrated both for her maſter-pieces of art and for the induſtry of her inhabitants; on the iſland of Crete, in which poetry has placed the cradle of Jupiter; and, in ſhort, on the whole Archipelago, in which the illuſions of fable conſpired with the charms of nature to create a region of enchantment. What happy revolution, what exertion of European policy, will reſtore this country to its priſtine glory; and there rekindle, after the lapſe of twenty centuries, the torch of the arts? Modern Greece having been thus unfortunately ſubjected to the Turkiſh yoke ever ſince the fifteenth

fifteenth century, is now generally diſtinguiſhed by the appellation of Turkey in Europe, of which it forms the moſt ſouthern part. Romelia contains Thrace, Pæonia, Macedonia, and all the northern part of ancient Greece; while the Morea compriſes the whole of the ancient Peloponneſus. On the weſt of Romelia is ſituated Albania, which includes the kingdom of Epirus, Chaonia, and part of Illyricum. Crete, which ſo long proſpered under the laws of Minos, is now Candia. The whole of theſe territories, with the iſlands of the Archipelago, are alike under the dominion of the grand ſeignior; for particulars of all which, ſee under their reſpective names in this Encyclopædia. Magna Græcia, which became part of the kingdom of Naples, is the modern Campania; in which were the celebrated cities of Herculaneum and Pompeii; both of which were overwhelmed with lava in an eruption of Mount Veſuvius, in the year of Chriſt 79; and after the lapſe of ſixteen hundred years, they were again diſcovered, at the beginning of the eighteenth century.—See thoſe articles.

Of the preſent degraded and humiliating condition of the modern Greeks, we have but too many affecting inſtances, as ſet forth in the recent details of judicious and reſpectable travellers. M. Sonnini, who traverſed Egypt and Greece by order of Louis XVI. furniſhes us with the following intereſting remarks: "If, ſays he, from the compariſon of the phyſical ſtate of the two countries, we paſs to that of the men who inhabit them, we ſhall find no reſemblance but in the deſpotiſm by which they were both enſlaved. The Copt, or native of Egypt, whoſe character partakes of the dryneſs and rudeneſs of the climate, is ſhort and heavy; his head is big, but empty; his face is broad and flat; his complexion is ſallow and dark; and his countenance is mean. His diſpoſition is gloomy and melancholy; his treachery is the more dangerous, as it is, in a manner, more concentered: having no taſte for the arts, no flight of curioſity leads him to inſtruction; ſedentary, becauſe he has no vivacity in his mind, he ſeeks not to be acquainted with what ſurrounds him; lazy and ſlovenly, clowniſh and ignorant, unfeeling and ſuperſtitious, he has no longer any remembrance, nor even any trace remaining, of the greatneſs of his anceſtors. See the article EGYPT.

"What a difference between this nation, entirely degenerated, and that which ſtill inhabits the fallen countries of Greece! Under a pure ſky, in a wholeſome, temperate, atmoſphere, impregnated with the ſweeteſt emanations, on a ſoil which nature decks with flowers, and clothes with the verdure of eternal ſpring, or which may be enriched with crops of every ſort, or with delicious fruits, we muſt expect, among the men, to meet only with amenity of manners and ſweetneſs of diſpoſition. I am ſpeaking of the men whoſe generations there ſucceed each other without interruption; for the ignorant and untractable uſurper may, by his ſtupid ferocity, pollute the moſt happy climate, the moſt ſmiling country; and ages are required for their influence to temper, in a perceptible manner, the rudeneſs of his inclinations. The man of theſe charming parts of Greece is of a handſome ſtature; he carries his head high, his body erect; he is dignified in his carriage, eaſy in his manners, and nimble in his gait; his eyes are full of vivacity; his countenance is open; and his addreſs agreeable and prepoſſeſſing; he is neat and elegant in his clothing; he has a taſte for dreſs, as for every thing that is beautiful; active, induſtrious, and even enterpriſing, he is capable of executing great things; he ſpeaks with eaſe, he expreſſes himſelf with warmth; he is acquainted with the language of the paſſions, and he likewiſe aſtoniſhes by his natural eloquence; he loves the arts, without daring to cultivate them, under the brazen yoke which hangs heavy on his neck; ſkilful and cunning in trade, he does not always conduct himſelf in it with that frankneſs which conſtitutes its principal baſis; and if we ſtill find in modern Greece many of the fine qualities which do honour to the hiſtory of ancient Greece, it cannot be denied that ſuperſtition, the child of ignorance and ſlavery, greatly tarniſhes their luſtre; and we alſo diſcover in their diſpoſition that fickleneſs, that pliability, that want of ſincerity, in ſhort, that artful turn of mind which borders on treachery, and of which even the Greeks of antiquity have been accuſed. Every one is acquainted with that famous line which paints ſo well the character of the Greeks: *Timeo Danaos, et dona ferentes.*

"But this obliquity of character fortunately does not extend, or at leaſt is very much weakened, among the women of the ſame countries. The Greek ladies are, in general, diſtinguiſhed by an elegant ſhape, and a majeſtic carriage. Their features, traced by the hand of beauty, reflect the warm affections of ſenſibility; the ſerenity of their countenance is that of dignity, without having its coldneſs or gravity; they are amiable without pretenſion, decent without ſourneſs, charming without affectation. If, to ſuch brilliant qualities, we add elevation of ideas, warmth of expreſſion, thoſe flights of ſimple and ingenuous eloquence which attract and faſcinate, a truly devoted attachment to perſons beloved, exactneſs and fidelity in their duties, we ſhall have ſome notion of theſe privileged beings, with whom nature, in her munificence, has embelliſhed the earth, and who are ſtill the natives of Greece.—It is however to be lamented, that this amiable and intereſting people ſhould continue under the heavy yoke of the ſtern and proud Muſſulman; their ſlavery, like that of the deſcendants of the ancient Egyptians, is abſolute, and of too long ſtanding."

The iſlands of the Ægean Sea are the next objects of M. Sonnini's reſearch; thoſe numerous groups of lands and rocks, promiſcuouſly ſcattered throughout that ſea as an eternal monument of its depredations on the continent, which were divided by the ancients into Cyclades and Sporades: denominations now no more remembered, as they at preſent are known only under the general deſignation of the Iſlands of the Archipelago; for the ancient names of which ſee the article GEOGRAPHY, p. 378, of this volume; and for the modern names, ſee the article ARCHIPELAGO, vol. ii. p. 63.—As moſt of theſe iſlands, which are remarkable for the beauty and the fertility of their ſoil, celebrated by the writers of antiquity, and famed for having given birth to great men, are ſtill important points of eſtabliſhment, communication, or commerce, they become of the greater intereſt to the inquiſitive reader.—Stampali, he tells us, is one of the moſt fertile of the iſlands, and the inhabitants participate in the mildneſs of the climate and the ſoil; being free from that harſh and rough character ſo viſible in their neighbours, the iſlanders of Calamo and Lero, which are hard and rugged countries. In theſe regions, however, ſo favoured by nature, and ſo diſgraced by the form of government to which their unhappy lot has doomed them, the gifts of ſuperior fertility ſerve only as a ſcourge, and a rocky barrenneſs would be a deſirable boon: ſince the natural and legitimate ſource of riches becomes that of frequent extortions. The more ſmiling and beautiful is the country, the more it invites the attention and the viſits of their cruel exactors, who take from the inhabitants all encouragement to induſtry, and entirely ſuppreſs agriculture; while theſe ſenſeleſs deſpots, who ruin themſelves by ruining their territory, avoid the ruder climates, becauſe they are afraid of men who live on mountains, the uſual aſylum of poverty, courage, and independence. But the iſland of Delos, formerly ſo opulent, (ſays M. Sonnini,) and where were celebrated with ſo much pomp religious ceremonies, in preſence of an immenſe concourſe who repaired thither from all points of the eaſt, is now no longer any thing but a deſert, aban-

doned to filthy animals, and covered with ruins and rubbiſh. Pirates and robbers are almoſt the only men who land there; they go thither to ſhare the fruit of their plunder, or concert new ſchemes of rapine, ſeated on fragments of altars where incenſe and perfumes burnt in honour of the god of day. The ruins of Delos, the impoſing remains of the moſt beautiful edifices of which ancient Greece was proud, are now no longer what they were at the periods when modern travellers viſited and deſcribed them. They themſelves have their ruins, and they owe their freſh degradation to the profane barbariſm of people who come thither to take materials for building their houſes, or to wretched Turkiſh ſculptors, who carry off every year precious pieces, in order to make of them thoſe little pillars ſurmounted by a turban, which the Mahometans erect over the graves of the dead.

In the Travels of M. Stephanopoli through Greece in 1798, it is ſtated, "that if a Greek appears in a rich habit, the loweſt Turk will enviouſly take out his knife, and cut it in pieces. Throughout Romelia, a Greek male child is no ſooner born, than the firſt Turk who hears of it ſends his handkerchief to the father, and from that moment the child is his ſlave; if the father refuſes the handkerchief, the Turk ſoon finds out a method of ruining both father and child. A Turk, however low, conſiders every Greek whom he meets as being at his command, and orders him as he pleaſes. A Greek iſlander was lately meaſuring out corn from his boat; a Turk on the pier ordered him to fetch fire to light his pipe; the Greek ſtopped to fill his ſack, which wanted very little of being full; and the Turk, becauſe he did not obey him inſtantly, ſhot him dead.

"Stravachi, a Greek, while a ſort of intendant to the beys of Wallachia and Tranſylvania, accumulated a large fortune. Repeated vexations, which his wealth had brought on him, induced him to preſent himſelf before the grand ſeignior, whom he thus addreſſed:—"Pleaſe your highneſs, I am worth twelve millions of piaſtres; I have no child; thou ſhalt be my heir; guarantee my fortune to me for my life." The ſultan, pleaſed with the offer, laid his hand on the other's ſhoulder, and ſaid, "Enjoy thy fortune in ſafety." For ſome years he was unmoleſted; but, at laſt, they thought that he lived too long; they accuſed him to the ſultan of intending to eſcape, with his fortune, to Ruſſia; they obtained a decree of death againſt him; and he was inſtantly taken and hung."

The ſtatements of theſe foreign writers are fully confirmed by our own countryman, Mr. Eton, who was many years reſident in Turkey. He remarks that the captain paſha, or grand admiral of the Archipelago, goes annually with a fleet to collect the tribute: it is then that the poor Greeks feel the weight of the iron ſceptre that governs them, and all the inſults and oppreſſion of the vile ſatraps of the tyrant. When a ſhip of the fleet arrives in a port, all the people who can, fly to the mountains or into the country, others ſhut themſelves up in their houſes, without daring to ſtir out. All who are on the roads are plundered by the ſoldiers and ſailors of the ſhips, and if they are not cut or maimed, they eſteem themſelves happy: even in the ſtreets it is the ſame. Thus the poor Greeks pay another contribution to the fleet, which is heavier, to thoſe on whom it unhappily falls, than that to the ſultan.

If a woman, or a girl, or even a boy, is met by them in any place not immediately under the eye of their officers, or where they might be expoſed to reſiſtance, they are inſtantly made victims to their brutality. In ſmall towns and villages, this ſometimes happens in the ſtreets. The officers cannot always, and often will not, reſtrain them, except where the crime is too public, and complaint might be made to the porte. The captains and officers raiſe contributions for themſelves on the principal inhabitants under various pretences. The Greeks are generally prevented from complaining, out of fear that the next ſhip which comes will take revenge. When the Turkiſh ſhips of war are met at ſea, they are little better than pirates to the Greeks and Raguſans.

The inſenſibility of theſe barbarians is at the ſame time aſtoniſhing: living amid the effulgence of genius, they have not caught one ſingle ſpark; they gaze with unfeeling ſtupidity on the wonder and boaſt of art, on their glorious monuments, on their temples, and conclude they were built by genii, and then deſtroy them, to burn the marble for lime to make ſtucco for their houſes, whence the fine arts are baniſhed; where ignorance, tyranny, ſuperſtition, and groſs ſenſuality, dwell; and lay waſte the country round, imbruing their hands in the blood of the helpleſs, by murdering, without remorſe, thoſe they have conquered. Thus the fineſt countries in the world are almoſt become deſerts; part inhabited by ſavage beaſts, and part by more ſavage men; the poor aborigines ſkulking in hiding places like the timid hare, (which epithet the Turks give them in deriſion,) while thoſe beaſts of prey in human ſhape roam abroad. Every object moral and phyſical, the fair face of ancient Greece, and the intellectual energies of the inhabitants, have alike been blaſted and defiled by Mahommedan tyranny. As an inſtance of thoſe changes which the country has undergone, we need only conſider the iſland of Cyprus, now an almoſt uninhabited deſert, which was, not only in ancient times, but when it was taken by the Turks from the Venetians, populous and exceedingly rich. The number and excellency of its productions were wonderful. At preſent only a little cotton, ſome ſilk and wine, and a few drugs, are its produce; but of no great amount. Even the ſalt-works, which were ſo great a branch of revenue and commerce to the Venetians, have produced nothing ſince the Turks have been poſſeſſed of the iſland.—See the article CYPRUS, vol. v. p. 545.

Of the defects of the Grecian character, ſome are doubtleſs owing to their ancient corruptions; but moſt of them take their riſe in the humiliating ſtate of depreſſion in which they are held by the Turks. This degradation and ſervility of their ſituation has operated for centuries, and has conſequently produced an accumulated effect on the mind; but were this weight taken off, the ſuperior vigour of the ſoul would have wide room for expanſion; and though it cannot be expected that they would at once riſe to the proud animation of their former heroes, they would doubtleſs diſplay energies of mind, which the iron hand of deſpotiſm has long kept dormant and inert. It is rather aſtoniſhing that they have retained ſo much energy of character, and are not more abaſed; for like noble courſers they champ the bit, and ſpurn indignantly the yoke; when once freed from theſe, they would doubtleſs re-enter the courſe of glory. When alſo we view the modern Greeks in their more comprehenſive character as a nation, their ſuperiority over the Turks in knowledge is ſurpriſingly great; they poſſeſs an enlarged degree of genius and invention, and are of a lively imagination; both men and women ſpeak much, and with natural volubility and boldneſs; numbers of them ſpeak Italian, but all have an activity and ſprightlineſs which ſtrongly contraſts with the ſenſeleſs gravity of the Turks; an European finds himſelf as it were at home with them, and amongſt creatures of his own ſpecies; whilſt with Mohammedans there is a diſtance, a non-aſſimilation, a total difference of ideas; and the more he knows of their language, the more he perceives it; on the contrary, the more intimately he knows the Greeks, the more ſimilar does he find them in habits and manners to other Europeans: their bad reputation is more owing to the ſlander of their enemies, than to any great degree of demerit. In general, they are an agreeable and a ſerviceable people, but they are much given to levity, are im-

moderately ambitious, and fond of honourable diſtinctions; but this very ambition, now a weakneſs, when they have nobler objects to purſue will lead them to greatneſs.

From the account given by Tott, (vol. i. p. 118,) of the diſturbances excited by the patriarch Kirilo, it would appear that the Greeks have not yet entirely abandoned that ſpirit of ſuperſtition and bigotry, which was, perhaps, the main cauſe of their former downfall. It muſt be obſerved, however, that theſe diſputes are not ſo much foſtered among themſelves, as they are owing to the efforts of the Latin church, which was the caſe in the inſtance alluded to, where the foundation of the conteſt was a bull of the pope, directed againſt the Greek church. See the eccleſiaſtical diſcipline of theſe churches under their reſpective heads. The Greeks bear the Turkiſh yoke with greater impatience than other Chriſtians, and poſſeſs a ſpirit of enterpriſe which, however ridiculed by ſome authors, often prompts them to noble atchievements. Their ancient empire is ſtill freſh in their memory; it is the ſubject of their popular ſongs, and they ſpeak of it in common converſation as a recent event. And that they poſſeſs a firm and manly courage, notwithſtanding the inſinuations of their calumniators, has been too often teſtified to be in the leaſt doubtful; the inſtances which they not long ſince diſplayed in the Ruſſian ſervice, have been truly ſtriking. The moſt obſervable difference in the Grecian character, is between thoſe of Conſtantinople and their countrymen of the iſlands. The merchants and lower orders of the Conſtantinopolitan Greeks have indeed no very marked character; they are much the ſame as the trading Chriſtians in all parts of the empire; that is to ſay, as crafty and fraudulent as the Jews, but leſs ſo than the Armenians, who are the moſt ſubtle of all uſurers.—See the article ARMENIA, vol. ii. p. 194.

But in the ſuburb of Conſtantinople called the *Fenàr* or *Fenàl*, there lives a race of Greeks who call themſelves nobles, being the deſcendants of certain opulent Grecian families, and from among whom are generally appointed the drogomans of the porte, and the waywodes of Wallachia and Moldavia. They have long kept theſe places among them, as they are moſtly allied together, and, for this purpoſe, keep up a conſtant connection with the officers of the porte. They are all people of good education, and are polite; but haughty, vain, and ambitious, conſidering the contempt they are treated with by the Turks. While they are drogomans of the porte, they are obliged to behave with great caution and prudence, but when they become waywodes, they are in nothing different from Turkiſh paſhas in tyranny; nor is it to be wondered at, when men are obliged to look up not only to tyrants, but to the very ſervants of tyrants, for honour and promotion; to flatter their ignorance and ſtupidity, their foibles and their vices, and to tremble for their lives at their frowns, that cunning takes the place of wiſdom, vice of virtue, and treachery of fortitude. In ſuch a ſituation the mind muſt loſe its vigour, the heart its generoſity: the abaſement of man by ſuch cauſes was never more ſtrongly exemplified than in the inſtance of the Greeks of the Fenàl; they do not weep over the ruins which they cannot reſtore, nor glow with emulation to rear others of equal magnificence. For no ſooner is a waywode appointed, than he ſets out in great ſtate for his government, attended by a crowd of relations and dependents, for all of whom, as well as for his own ſplendor, he muſt provide, by oppreſſing the unhappy ſubjects of his government. Meanwhile his countrymen at Conſtantinople are engaged in continual plots for his removal, and it becomes neceſſary for him to accumulate a large ſum to bribe the miniſters and others on his return, and to avert the perſecution which continues for years afterwards to hang over him.

The Greeks of Macedonia, Thrace, &c. are robuſt, courageous, and ſomewhat ferocious; thoſe of Athens and Attica are ſtill remarkably witty and ingenious; all the iſlanders are lively and gay, fond of ſinging and dancing to an exceſs, affable, hoſpitable, and good-natured; in ſhort, they are the beſt; thoſe of the Morea are much given to piracy; but it is not to be wondered at, conſidering the cruel treatment they have met with, and the ſtruggles they are continually making againſt the Turks. Albania, Epirus, and in general the mountaineers, are a very warlike, brave, people, but very ſavage, and make little ſcruple of killing and robbing travellers; a Turk cannot venture into their country alone; there is no one in it but would make a merit of ſhooting him, ſo deeply is their hatred to their oppreſſors rooted. The Greeks of Zante and Cephalonia, ſubject to the Ruſſians, are notorious for ſtabbing with knives. In ſome of the iſlands, the people are not handſome. In Mitylene, the women are remarkable for very large breaſts. In Tinos, the women are almoſt all beauties; and there the true antique Grecian contour is to be found. In general, the people of the iſlands have grand and noble features. From different faces you may put together, in walking through a market-place, the heads of Apollo and of the fineſt ancient ſtatues.

It is impoſſible for any perſon to form a judgment of the conduct of the porte towards theſe provinces, by any analogy from the political operations of other European nations. Amongſt us, the unſucceſsful revolt of a whole province would indeed give birth to ſome additional rigour, and to ſome ſtriking example of puniſhment; but the ferocious Turk propoſes nothing ſhort of extermination, in order to free himſelf from the fear of future defection. It was thus that, when the inhabitants of the Morea, who, inſtigated by the deſire of liberty, had taken up arms in favour of Ruſſia, returned under their yoke, a deliberate propoſal was made in the divan to ſlaughter them all in cold blood, innocent and guilty, of whatever age or ſex. Nor was this the firſt time that the maſſacre of the whole Greek nation had been ſeriouſly debated: it was, however, in the preſent inſtance, ſucceſsfully oppoſed by Gazi-Haſſan, both on motives of humanity and policy. The chief argument which he uſed, and which alone carried conviction to his hearers, was: *if we kill all the Greeks, we ſhall loſe all the capitation they pay.* Even without ſuch a provocation, ſultan Muſtafa, predeceſſor and brother of Abdulhamid, on his acceſſion to the throne, propoſed to cut off *all the Chriſtians in the empire*, and was with difficulty diſſuaded from it. Yet ſuch is the people with whom ſome certain Chriſtian nations, jealous and envious of each other, are emulous to form an alliance of brotherly amity and mutual good faith!

After the Greeks were conquered by the Turks, they were never admitted to the rights of citizens or ſubjects, unleſs they abjured their religion and their country; they became ſlaves, and as, according to their law, the Turks have a right at all times to put to death their priſoners, the conquered and their poſterity for ever are obliged annually to *redeem their heads*, by paying the price ſet on them. It is death for a conquered Greek to marry a Turkiſh woman, or even to cohabit with a common proſtitute of that nation. The teſtimony of a Greek is not valid in a court of judicature, when confronted with that of a Turk. They are diſtinguiſhed by a different dreſs; it is death to wear the ſame apparel as a Turk; even their houſes are painted of a different colour; in fine, they are in the ſame ſituation they were the day they were conquered, totally diſtinct as a nation, and ſtill groaning under the iron tyranny of the barbarous uſurpers of their country.—See Eton's Political State of Greece, p. 346–359.

To theſe remarks we ſhall add the valuable information derived to us from Mr. Dallaway, in his recent Excurſions to the Iſlands of the Archipelago.

"Although

"Although the renowned names of Comneni and Paleologi no longer exiſt, they are yet claimed by conſanguinity; and ſeveral of thoſe families, who are now the principal of the Greeks, can boaſt, with a certain degree of preciſion, a lineal deſcent from, or agnation to, them. The fertile provinces of Moldavia and Wallachia are now, or were lately, held by the chiefs of two powerful Grecian families of the Fenàl, Callimachi and Moroozi. The former was drogoman to the porte, that is, *terdji-man*, which ſignifies interpreter; and appointed in 1795; the latter, having officiated in that capacity at the peace of Seſtovia, concluded in 1792 between the Turks and Imperialiſts, was rewarded for his ſingular ability, in the following year. He diſcovered in his government more patriotiſm than his predeceſſors, many of whom have been ſacrificed to their treachery or avarice; and his people, inured to tyranny, experience unuſual clemency. As uſeful novelties, he has eſtabliſhed a preſs, a manufactory of cloth, and a regular poſt through his territory. His father was hoſpodar of Moldavia, and his education has been in courts, where he acquired that *fineſſe* and political acuteneſs, to which he owed his advancement, and by which he has gained more popularity than almoſt any other of the great families amongſt the Greeks, who occaſionally ſhare theſe emoluments. Conſidering that the whole character and importance of the fallen Greek nation is concentered in a few individuals, and their immediate relatives, the conteſts of implacable jealouſy, conducted by infinite intrigue, continually diſtract them; and the animoſity between the houſes of Montagu and Capulet is renewed in the Fenàl.

"Of the Ipſilandi family, the preſent chief has been twice prince of Moldavia, and once of Wallachia. He was taken priſoner by the Auſtrians, in the war with the Turks; was liberated at the peace, and then baniſhed to the iſland of Rhodes, from whence he has been ſince recalled. His ſon is the moſt accompliſhed and amiable of the modern Greek nobility. Verſed not only in oriental learning, he has acquired a critical knowledge of the claſſics, and European languages. Should he enjoy future advancement, he will probably exhibit a rare character amongſt his degenerate countrymen,—that of a ſcholar, and a promoter of ſcience and literature.

"To ſeveral princes of the houſe of Mavro Kordato, that name is truly appropriate. When hoſpodar of Moldavia, the preſent repreſentative patroniſed ſeveral literati, by whom a dictionary of *Romeïka*, or modern Greek, French, and Italian, was compoſed, in three volumes, 4to. A grammar is prefixed, which is the beſt attempt to reduce that language to ſyſtem, and to analyze its formation. Several of the moſt approved of the Italian and French comedies and novels have been tranſlated under his auſpices, and printed either at Venice or Vienna. Excepting ſmall religious tracts, the modern Greeks poſſeſſed no books in their preſent vernacular language, till this plan was adopted a few years ſince, which has circulated literature, confined as the ſubjects are, throughout the Turkiſh empire, ſo extenſively as to form an article of commerce. As to much original compoſition, it will be ſought for in vain. Amongſt the higher rank of Greeks, ſome of more liberal education or elegant turn of mind apply themſelves to poetry: theſe pieces are in manuſcript, and communicated only to a few; for as yet no collection of them has been publiſhed.

"To each of theſe diſtinguiſhed houſes, many ſubordinate families, who conſtitute the Greek gentry, are attached by intereſt or conſanguinity. During the zenith of power, the firſt object, both of the prince and his dependants, is to amaſs wealth, not always by the moſt juſtifiable meaſures. With that conſolation, they remove from their ſhadow of royalty to luxurious retirement, or more ſplendid habits of domeſtic life in the Fenàl, or on the delightful ſhores of the Boſphorus. Permitted to enjoy no revenue from the cultivation of lands, they place out their money with religious or mercantile communities, at an annual intereſt advancing from ſix to twelve per cent. With ſuch an income, according to the degree of acquired wealth, they maintain the dignity of their ſeveral ranks. When the original fund is exhauſted by gradual waſte, or ſudden calamity, their ſituation is embittered by many conſiderations; and perhaps by none is the ceaſeleſs conflict between poverty and pride more ſeverely felt. Should the ſucceſſion to the principalities be removed, and probably for a long period, from their particular patron, they are induced to accept of employments under the Turkiſh government, allured by the opportunity of growing rich, with a moral certainty that in proportion as they indulge their avarice, their lives are hazarded. Theſe obſervations apply to the Greeks, whoſe family pretenſions or ill-directed pride prevent their entering into commercial engagements. The acuteneſs and induſtry which ſome of that nation ſhew in conducting the traffic of the country (for trade on an ample or liberal ſcale neither their own genius nor other circumſtances will allow) are frequently ſucceſsful. In competition with Armenians or Jews, they exhibit ſuperior addreſs, but owing to many cauſes, which do not neceſſarily reſult from each other, the Turks treat them with leſs confidence in mercantile tranſactions.

"The capitation varies in three degrees, from four to thirteen piaſtres a-year, nor are the nobility liable to any other perſonal tax. From this ſtatement it might be at firſt ſuppoſed, that no conquered ſubjects contribute ſo little to the exigencies of the ſtate as the Greeks; but individuals frequently ſuffer greatly in their property, without redreſs. A Turk will ſometimes prefer an unjuſt demand as a debt, for the payment of which he ſues the Greek before the cadi, adduces the teſtimony of hired witneſſes, and obtains a deciſion in his own favour, excepting that the defendant has ſecured the judge by a bribe, bearing a proportion to the ſum in diſpute. In either caſe the extortion is great; and they call ſuch a tranſaction, which is perpetually happening, an *avanìa*. Yet degraded as the modern Greeks are in the political ſcale of Europe, no people are more apparently anxious with reſpect to pending tranſactions. Credulous in the extreme, or ingenious in inventing circumſtances, the current news engroſſes every converſation, and the gazette, publiſhed in Greek at Vienna, their grand oracle, is read or repeated with the greateſt avidity."

Between the Romeïka, or modern Greek language, and the ancient, a ſimilar analogy may be found as between the Latin and the pure Italian. When Conſtantine eſtabliſhed his new capital, ſo many Roman citizens followed him, that the Greek language adopted many Latiniſms; and, once corrupted, the more readily admitted the idiom and words of the French and Venetian invaders, at the commencement of the thirteenth century. The eſtabliſhment of the Ottoman empire extended the change, by the adoption of ſo many Turkiſh phraſes and words; and the Romeïka, or vernacular dialect, as it now prevails, thus became univerſally eſtabliſhed. Not that one mode of expreſſion only is in uſe. The inhabitants of the Morea and the coaſts of the Adriatic, partake much of the Venetian; the iſlanders of the Archipelago and the Smyrniotes mix Venetian with Turkiſh. The Greeks of the Fenàl ſpeak almoſt claſſically, whilſt thoſe of the oppoſite town of Pera have the moſt vulgar pronunciation. The leading cauſe of this deviation from the ancient Greek, has been the great uſe of contractions, and the blending by that means ſeveral words into one.

At what era the modern Greek pronunciation was adopted, it would be difficult to determine with any degree of preciſion. The more learned of the inhabi-

tants

tants of the Fenàl ſtrongly contend, that however their language has been debaſed by the alloy of others, the pronunciation of the remoteſt times is continued to them, pure and without variation. This queſtion, ſo much agitated at the revival of literature, is ſtill left doubtful. Certain it is, that the modern Greek, pronounced as the ancient in England, would be as unintelligible to them as the Italian at Rome or the French at Paris, if we ſpoke or read them exactly as they are ſpelled, giving to the letters and ſyllables the ſame power as to thoſe in our own language. The Romeïka reſembles in its conſtruction the Italian and French, and rejects the tranſpoſition of the ancient Greek or Latin. It retains the articles and inflection of caſes, but has neither duals nor aoriſts. The tenſes are formed by the verbs ſubſtantive. In this language all their tranſactions are conducted.

The criminal and civil law amongſt the modern Greeks, are directed by the preſcriptions of the Juſtinian code, under the ſuperior authority of that of Iſlamiſm. This exception only can occur, that thoſe who chooſe to aſſent ſolely to the juriſdiction of the eccleſiaſtical law, refer their matters of diſpute to their own parochial prieſts, and in caſes of higher importance to the patriarch of Conſtantinople. If they ſhould be diſſatisfied with theſe awards, they reſort finally to ſome competent court of Turkiſh judicature, the decree of which is deemed final. In ſuch a caſe, if an appeal has been made by perſons without intereſt, or on occaſions without importance, the patriarch has influence ſufficient with the porte to induce them to reverſe in his favour the acts even of their own tribunal. He can then proceed againſt the parties, inflict eccleſiaſtical penalties, or corporal puniſhments, conducting the affair with delicacy as to the matter and perſon, ſo as not to drive any one of his ſubjects in deſpair to become a proſelyte to the Mohammedan faith. The majority of queſtions agitated reſpecting property are ſettled by arbitration, or by the fiat of the patriarch. Thoſe which ariſe between the intemperate or diſreputable part of the Greek nation, are uſually concluded in the Turkiſh courts of judicature. Every deciſion turns upon the authority of the Juſtinian code, the only legal book with which the beſt informed are converſant; and tradition or uſage determines the reſt.

Amongſt the modern Greeks, as there is neither hereditary dignity nor feodal ſucceſſion recogniſed by their conquerors, the right of primogeniture has a partial prevalence. In the iſland of Tinos, one of the moſt conſiderable in the Archipelago, in which no Turk reſides, the following local cuſtoms reſpecting property are religiouſly obſerved. A man may bequeath his lands by will, in default of which the relict and children make an equal partition. An opulent perſon poſſeſſing an eſtate, and wiſhing to buy the next to him, muſt have the conſent of the other neighbour, who is entitled to purchaſe half of it; which right, if the neighbour be poor, is ceded for a certain pecuniary compenſation.

The right of female inheritance in Mitylene, as well as the ſingular cuſtom at a village in that iſland, of furniſhing voluntarily every ſtranger with a temporary wife, choſen from the youngeſt and moſt beautiful women, both aſſerted by M. Guys, have ſcarcely a foundation in fact, and certainly not in modern practice. But adoption, ſo common with the ancients, is not unfrequent in many of the iſlands. It is even ſanctioned by a preſcribed ceremony of the Greek church. The perſon to be adopted is preſented at the altar by his own parents and the adopter, and, after the ſervice appointed for that purpoſe is read, the adopted throws himſelf at the feet of his new father, who, placing his right foot on his neck, declares him to be his ſon in future. Until he has attained to fifteen years, the adopted is obliged to bear the name of the adopter, when, ſhould he prefer it, he is at liberty to reſume his own. If the child be very young, the whole ceremony conſiſts in the adopter's wife throwing her mantle over it, who then makes her avowal. In moſt of the iſlands are fraternities and adoptions of both ſexes, called, "the brotherhood of the holy zone," which, adminiſtering occaſions of familiar intercourſe, have frequently led to circumſtances which the clergy have found neceſſary to prevent.

The veneration with which we ſurvey Greece as the nurſe of ſcience and of every liberal art, increaſes the regret that the ſame region ſhould now be overſpread by barbariſm and ſuperſtition, and that ignorance ſhould have uſurped the favoured abode of philoſophy and elegance. Such a contraſt has been the gradual effect of many revolving ages; and perhaps it would not be diſtant from truth if we placed the firſt ſtriking era of degeneracy at the period of the Roman conqueſt. The eſtabliſhment of the Chriſtian religion under Conſtantine was inauſpicious to the fine arts, few of which were at firſt employed in the decoration of churches, and ſome of them were ſeverely interdicted. Nor was philoſophy advanced, whilſt the reaſoning faculties of the ableſt minds were engroſſed by abſtruſe and myſtical queſtions, and the pride of ſcholaſtic learning ſpurned at the ſimple pretenſions of moral and mild doctrines, the firſt object of which is to meliorate the heart.

The decline and fall of the arts of Greece may be attributed to various cauſes. When removed to Rome, had the dogmas of the catholic religion been as adverſe to them as the Greek, the ſame neglect or ſubverſion would have conſequently happened; and it is from a compariſon of their preſent ſtate, under the influence of religious opinion, that the true cauſe will be found to reſult. The iconoclaſts in the eighth century deſtroyed with indiſcriminating rage not only the remaining ſtatues of claſſic antiquity, but thoſe of ruder workmanſhip, which were then found in eccleſiaſtical ſtructures. Excluded and conſidered as unholy, when the work was thus deſpiſed, no encouragement was given to the artiſt. In the weſtern diviſion of the Chriſtian church, the crowded niches ſufficiently evince in what veneration ſtatuary was held. Even in the rude centuries of Chriſtianity the art of intaglio and ſculpture were partially known and applied, whilſt the coins of the eaſtern emperors are ſcarcely equal in merit to thoſe of our Saxon or Norman kings.

If any exception can be made, it is in favour of the art of moſaic, which was invented and ſervilely imitated by the Greeks in ages diſtant from each other, and which in its ſecond ſtate gained an eventual perfection at Rome. The ſole merit of theſe laſt performances conſiſted in the compoſition of the materials and their extreme durability. To the deſigns, confined chiefly to portraits with diſproportioned outline and diſtorted features, no praiſe can be given; and it is ſcarcely credible, that artiſts who were the ſucceſſors of thoſe who invented all that is exquiſite in elegance and correctneſs, ſhould have ſo groſsly deviated from the firſt principles of taſte. In architecture, ſince the eſtabliſhment of the Turks, the modern Greeks have had few opportunities of ſhewing either their perfection or inability. Prohibited from erecting ſtructures for the celebration of their worſhip, or palaces for the diſplay of their wealth, they have been employed only in building moſques by ſucceſſive ſultans, in a ſtyle, if not peculiar, retaining much more of the Saracenic and grotefque, than any analogy to the rules of the antique.

When the arts of Greece in their progreſs had formed a mutual dependance on each other, and ſculpture lent grace to utility and added ſpirit to ornament, external embelliſhment, ſymmetry of component members, and the general effect of an elevation, reſulting as much from an elementary knowledge of the mechanical as the taſteful diſpoſition of the lighter parts, gave certain proof

proof of the abilities of the architect. We cannot ſuppoſe, from any analogy with other remains of the proficiency in the arts to which the ancients had attained, that the grand idea of durability was ever made ſecondary to a happy deſign or a more beautiful elevation produced independently of a ſolid foundation. Before ornament they conſidered uſe; and thoſe who enjoyed celebrity in their profeſſion, could not obtain it from ſuperior taſte, whilſt their works evinced any ignorance of geometrical elements. With that mixture of regret and ſatisfaction with which we can at preſent ſurvey the Grecian architecture, wonderful it is that any remains ſhould have been preſerved to modern days by the excellence only of their primary conſtruction, nor otherwiſe could the power have been continued to us of inſpecting what from its perfect conformation has ever reſiſted the rage of barbarians, and would have ſcarcely yielded to gradual decay.

Painting may be conſidered as loſt to Greece. In moſt of their churches are portraits of the Panageia of Madonna, and of the equeſtrians St. George and Demetrius, which are neatly pencilled upon a ground of gold in a hard ſtyle, like the ancient illuminated miſſals. Of perſpective, hiſtory, or landſcape, they have not even the remoteſt idea.

When muſic was expelled from public worſhip, and held to be profane in ſociety, it ſoon became ſilent, and conſequently forgotten. The droniſh chaunt, unaſſiſted by inſtrumental muſic, has high antiquity only to recommend it; for the dulleſt ears would be diſguſted by ſuch a grating monotony. What airs are now in popular uſe are borrowed from the Venetian mariners, and, ſimple or rude as they may be, are too complicated for the imitation of the uneducated modern Greeks, who can never learn the ſecond part of any tune. This obſervation refers only to the vulgar; thoſe of education admire and perform Italian muſic. Hence it will be ſeen that upon the ſanction of the religion and munificence of a country, the arts muſt depend. The love of ſcience may prevail in the minds of individuals, even when it is proſcribed by the laws; but the arts live and flouriſh only under the foſtering influence of avowed and munificent patronage. In Italy, with all theſe circumſtances long in their favour, whilſt architecture, painting, ſculpture, and muſic, were hallowed by their appropriation to the popular religion, we can immediately trace their revival and gradual perfection; and in Greece their rapid decline may be attributed to the contrary cauſe, as ſingularly efficient; for debaſed as the modern Greeks are, under the oppreſſive government of the Turks, no one who has been converſant with them can ſuppoſe that, had the political character and fortune of their nation been more propitious in modern days, nature ſhould oppoſe any prevention to their maintaining and improving their original excellence. Paſt and preſent obſervation and experience proclaim the contrary fact.

India and Egypt, for many preceding ages, had cultivated the arts; but theſe countries were only the cradle of knowledge; when tranſmitted to the genial climate of Greece, foſtered by her political freedom, and animated by her vivacity and enterpriſe, it quickly attained the ſublimeſt heights, and inveſted the human character with a dignity before unknown. By what gradations their ancient ſimplicity, temperance, modeſty, and good faith, ſunk away, and how the decay of their virtues involved the ruin of their genius, the preceding hiſtory will ſhew: let the philanthropiſt, peruſing the inſtructive leſſon, weep over the fall of human greatneſs; or rather let him collect from the fatal example, new incitements to energy and perſeverance in the cauſe of private and of public virtue.—See Mitford's and Gillies's Hiſtories of Greece; Stewart and Revett's Athens; Harwood's Antiquities; Dallaway's Conſtantinople, &c. &c.

GREE'DILY, *adv.* Eagerly; ravenouſly; voraciouſly; with keen appetite or deſire.—*Greedily* ſhe engorg'd without reſtraint. *Milton.*

Ev'n deadly plants, and herbs of pois'nous juice
Wild hunger ſeeks; and to prolong our breath,
We *greedily* devour our certain death. *Dryden.*

With avidity of ſpirit.—Unto his reſkew ran, and *greedily* him ſpedd. *Spenſer.*

GREE'DINESS, *ſ.* Ravenouſneſs; voracity; hunger; eagerneſs of appetite or deſire.—Fox in ſtealth, wolf in *greedineſs*. *Shakeſpeare.*

I with the fame *greedineſs* did ſeek,
As water when I thirſt, to ſwallow Greek. *Denham.*

GREE'DY, *adj.* [Ꝿnædiȝ, Sax. *graadig*, Dan. *gretig*, Dutch.] Ravenous; voracious; hungry.—As a lion that is *greedy* of his prey. *Pſ.* xvii. 12.—Be not unſatiable in any dainty thing, nor too *greedy* upon meats. *Eccleſ.* xxxvii. 29.—Eager; vehemently deſirous. *It is now commonly taken in an ill ſenſe.*—The ways of every one that is *greedy* of gain. *Prov.*

Greedy to know, as is the mind of man,
Their cauſe of death, ſwift to the fire ſhe ran. *Fairfax.*

Stern look'd the fiend, as fruſtrate of his will,
Not half ſuffic'd, and *greedy* yet to kill. *Dryden.*

GREEK, *adj.* Belonging to Greece, pertaining to the cuſtom or language of the Grecians.—Technical words mean ſuch particular words as relate to any art or ſcience, from the *Greek* word τεχνη. *Cheſterfield.*

GREEK, *ſ.* [from the *adj.*] A native of Greece; the language of the ancient Grecians.—Did Cicero ſay any thing? Ay, he ſpoke *Greek*. *Shakeſpeare.*—When thou taught'ſt Cambridge, and king Edward, *Greek*. *Milton.*

GREEK BIBLE. See BIBLE, vol. iii. p. 11.

GREEK CHURCH, or EASTERN CHURCH, ſo called in contradiſtinction to the Romiſh or LATIN CHURCH, which ſee. This laſt is likewiſe diſtinguiſhed by the epithet of *Weſtern Church*, as having been under the uncontrolable ſupremacy of the popes, in the weſtern empire. The diſcipline of the Greek church is under the direction of four of their higheſt dignitaries, who are denominated "*Patriarchs*;" and theſe hold a diſtinct juriſdiction, appended to their titles, over Conſtantinople, Alexandria, Antioch, and Jeruſalem, with their reſpective dependencies. The patriarch of Conſtantinople is nominated by the twelve biſhops who reſide the neareſt to that capital; and this patriarch has the privilege of nominating the other three; but the choice or fiat is in the grand ſignior, who in truth barters theſe dignities to the higheſt bidder. The biſhops are always choſen from among the monks, whoſe order, being more wealthy than the ſecular clergy, can better afford to pay for promotion. Theſe monks are under obligations ſimilar to thoſe of the mendicants in the church of Rome: but, by their rules, they are not allowed to ſay maſs: they are however leſs idle and uſeleſs than the Romiſh friars; for they cultivate their own grounds, and work at ſome handicraft buſineſs. The firſt order in the Greek church is that of reader, or anagnoſtis; the next, that of pſaltis or chanter, from which there is an immediate tranſition to thoſe of ſubdeacon and deacon: the candidate for this order muſt marry, and is directed to chuſe *a chaſte and beautiful virgin*; for the Greek canons obſerve that he who, as a miniſter of the altar, muſt hold communion with angels, muſt not profane his perſon by a commerce with vice and uglineſs. With reſpect to theſe qualities, however, he is not allowed to depend ſolely on his own judgment, but is obliged to appear before the biſhop with his miſtreſs, and with great humility to aſk him, whether he thinks her chaſte, beautiful, and a virgin? If the prelate approve his choice, he ſmiles, kiſſes her

cheek, and gives her his bleſſing: but if he be not pleaſed with her, he ſays to the candidate, '*Return to the Holy Ghoſt and pray that he would enlighten thee.*'—See Abbé Mariti's Travels, 1791.

As the ſeeds of enmity and diſcord are but too often and too fatally ſowed between Chriſtians of different countries and perſuaſions, ſo it very early and unfortunately happened between the ſpiritual governors of Rome and Conſtantinople, who appear mutually to have ſet on foot a vindictive and intolerant ſpirit of animoſity and perſecution, which eventually gave to the receſſion of the eaſtern church the denomination of the *Greek ſchiſm*. But the ſeparation of the eaſtern or Greek church from that of Rome, and the animoſities which ſubſiſted between them for ſo many ages, are not to be aſcribed to their early difference in opinion concerning the obſervation of certain feſtivals, nor even to the more important ſubjects of diſpute which gave riſe to the Arian hereſy. They are rather to be referred to that period when Conſtantine removed the ſeat of empire from Rome to Byzantium, and, by augmenting the dignity of the latter ſee, rendered it formidable to the authority of the Roman pontiff. In the ſecond general council, the biſhop of Conſtantinople was allowed to rank next in order to the pope of Rome, and by the twenty-eighth canon of the ſynod of Chalcedon, he was permitted to enjoy an equal rank. No ſmall reſiſtance was made to theſe encroachments on the ſuperior dignity of the ſucceſſor of St. Peter; but the emperors of the eaſt were ſtrenuous to aſſert the privileges of the new city, and by the preponderance of their authority confirmed all its pretenſions. The flame of reſentment, though ſtifled for a time, broke out with increaſed fury in the eighth century. A new cauſe of offence was given by Leo, the Iſaurian, in his zeal againſt images, of which the Roman pontiff did not fail to take advantage. On this occaſion, however, pope Gregory carried his perſecution of the Iconoclaſts too far; for the emperor, as well to reſtrain his power as to puniſh his arrogance, ſeized his poſſeſſions in Calabria, Sicily, Illyricum, and Greece, and transferred them to the juriſdiction of the biſhop of Conſtantinople. From that period we may conſider this unfortunate ſchiſm as fixed and incurable; for notwithſtanding the church of Rome was accuſed of various errors and irregularities, both by Photius and Michael Cerularius, it is certain that theſe were not the principal cauſe of diſſenſion. Hence the two attempts made by Michael Paleologus to allay the fervour of contention were vain, and the union propoſed by the council of Florence was of ſhort duration. The mutual ſacrifices required were unpalatable both to the Roman and the Conſtantinopolitan prelate; ſo that each remains to this day the centre of a different ſyſtem.

Conſidering the ſtate of the Greek clergy, and the want of curioſity which ſeems to have prevailed in moſt parts of Europe reſpecting that church, a genuine account of its doctrine and articles of faith is hardly to be expected. In conſequence, however, of a controverſy between Meſſrs. de Port Royal and John Claude, the celebrated proteſtant miniſter of Charenton, the religious tenets of the Greeks were ſcrupulouſly examined, by which we are enabled to aſſert that the doctrines of the Greek church differ but very little from thoſe of Rome, at leaſt that they are much more reconcileable to the faith of the latter, than that of the Lutheran or reformed churches. That diſcuſſion will authoriſe the aſſertion, rather than the numerous certificates, which were eaſily obtained, by each party, in favour of their own cauſe, from eccleſiaſtics ſcarcely leſs corrupt than indigent and unenlightened.

The doctrine of the trinity, and the articles of the Nicene and Athanaſian creeds, are received by the Greeks, in common with other Chriſtians. In one particular, indeed, they differ; they believe that the Holy Spirit proceeds from the Father only, and not from the Father and the Son; and in defence of this opinion they appeal to the eccleſiaſtical hiſtory, the acts of councils, the writings of the fathers, ancient manuſcripts, and eſpecially to a copy of the creed of Conſtantinople, engraven on two tables of ſilver, and hung up in the church of St. Peter at Rome, by order of Leo III. In the number of its ſacraments, the invocation of ſaints, the belief of the real preſence, the practice of auricular confeſſion, and in admitting maſſes and ſervices for the dead, the Greek church is perfectly conſonant to that of Rome. It is aſſerted that the doctrine of ſupererogation and its conſequent indulgences and diſpenſations are not adopted by the Greeks. But notwithſtanding this and other leſs important peculiarities, it is evident from the moſt authentic documents, that the creeds of Rome and Conſtantinople are not materially different. In vain are we reminded of the congregation de Propagandâ, or told that many of the Greeks have ſtudied in Italian ſeminaries, and of courſe little credit ſhould be given to theſe, being ſuch as were called Latinophrones, or perſons attached to the church of Rome. The fact is, that of thoſe who were not educated in Italy, few are able to give any rational account of their faith. If we diſtruſt ſuch men as Beſſarion, Mogilas, Leo Allatius, &c. we ought not to be leſs ſuſpicious of thoſe ignorant kaloyeri and prieſts who were never abſent from their own country. By the preaching and apoſtolical labours of jeſuit miſſionaries, many Greeks, ſpeaking collectively of all in the Ottoman empire, have been converted to the church of Rome. But theſe proſelytes were originally made by the Genoeſe or Venetians, to whom the Morea and the iſlands of the Archipelago were ſubject, and have continued from hereditary opinion.

It ſeems to be the general notion of writers on this ſubject, that no tenet, excepting the dread of excommunication, operates more powerfully in reſtraining the Greeks within the pale of their own church, and preventing their apoſtacy to the religion of the Romaniſts or Turks, than a rigorous obſervation of rites and ceremonies. By their eccleſiaſtical ordinances they are required to attend the ſervice of the church on the Lord's day, and on all faſts and feſtivals, not only ſuch as are uſual, but ſuch as are particularly appointed. The feſtivals of the Greek church are ſcarcely leſs numerous than thoſe of the Latin. They annually obſerve four principal faſts, viz. for forty days previous to Chriſtmas; for the ſame ſpace of time before Eaſter; from the week after Pentecoſt to the feaſt of St. Peter and Paul; and from the firſt to the fifteenth of Auguſt, this laſt being the day of Koimeſis, or Aſſumption of the bleſſed Virgin.

To give a minute detail of the rites and ceremonies of the Greek church would be a taſk of no ſmall labour and extent. The reader whoſe curioſity is intereſted in ſuch a reſearch, may conſult any of the liturgical authors mentioned by Fabricius, or our own countrymen Covell and King. Yet ſome remarkable peculiarities of their ritual claim more particular attention. They adminiſter the ſacrament of the Lord's ſupper to infants newly born; and in the place of confirmation they ſubſtitute the chriſm, or ſacred unction, being a part or appendage of the baptiſmal ceremony. Marriage is by them called the matrimonial coronation, from the crowns or garlands with which the parties are decorated, and which they ſolemnly diſſolve on the eighth day following. The ſacrament of the holy oil, or euchelaion, is not confined, as the extreme unction in the Romiſh church, to the ſick and dying, but is given to devout perſons upon the ſlighteſt malady, if required. The levipedium obſerved on Holy Thurſday, in imitation of our Saviour's humility, differs little from that ceremony as performed by the pope. On this occaſion Jeſus Chriſt is perſonified by the patriarch, and the twelve apoſtles by as many kaloyeri, when a ludicrous conteſt

ariſes who ſhall be the repreſentative of Judas; becauſe the name attaches for life.

Dr. King, in his "Rites and Ceremonies of the Greek Church," judiciouſly remarks, that by liturgy, the office of the euchariſt only was deſcribed; nor has it at preſent a different meaning in the Greek church, the four liturgies of which are thoſe of St. James, St. Baſil, St. Chryſoſtom, and thoſe of the pre-ſanctified myſteries. The firſt of theſe is aſſerted to be ſpurious by Smith, and therefore obſolete. The liturgies of St. Baſil and St. Chryſoſtom are eſſentially the ſame; but the former being the longer, is uſed only on certain days, while the latter is conſidered as the ordinary communion ſervice. That of the pre-ſanctified is appropriated for Wedneſdays and Fridays in Lent, or the great faſt. By ſome it is aſcribed to Gregory Dialogus, who lived in the ſixth century; but Smith attributes it to Germanus, patriarch of Conſtantinople, two centuries later.

The ſervice of the Greek church, like that of Rome at preſent, and that of all other churches before the reformation, is principally choral. Their canons and antiphones are hymns or portions of ſcripture ſet to muſic, firſt recited by the miniſter, and then chanted by the choir, but without muſical inſtruments, which are not admitted in accompaniment. The ectinèa correſponds with our litany, but is never ſo called by the Greeks. They have ſeveral in every ſervice. In conſequence of a great variety of theſe and other forms, their books of offices are numerous and bulky.

The Menæon contains the hymns and ſervices for every feſtival, as it occurs in the calendar, and is divided into twelve volumes folio, each volume comprifing the ſervice of a month. The Octoechos, is ſo called from eight tones or voices, which are fixed to particular hymns, and which ſerve as a rule for ſinging the reſt. It is divided into two volumes folio.

The Synnaxar, or biographical hiſtory of the ſaints, comprehends four volumes folio, of which an appropriate portion is read on every ſaint's day. To theſe muſt be added the pſalter and hours, the common ſervice, the four goſpels, the two triodes, the book of prayer, the ritual, and the regulation, wherein are contained directions how they are to be uſed.

Of the Menologion, it is ſufficient to remark that it nearly reſembles idolatry; they admit pictures into their churches, not merely as ornamental, but as indiſpenſable in the ceremonials of their religion. They are uſually attached to the ſkreen which ſecretes the chancel, and from thence receives the name of iconoſtas. In the arguments advanced by Greek theologiſts in defence of this preference of painting to ſculpture, there appears to be little ſolidity. They conſider themſelves as ſecure under the authority of St. John Damaſcenus.

The ſacerdotal habits are no leſs various, ſplendid, and coſtly, than thoſe of the Romiſh church. The biſhops and archimandrites wear mitres and other epiſcopal decorations during the performance of divine ſervice. The epitrachelion correſponds in ſome meaſure to the ſcarf worn by our clergy, as the phelonion does to the gown or ſurplice, excepting that the latter is made of rich ſilk or velvet, embroidered with gold or ſilver. In the emblematical and myſtical properties attributed to clerical veſtments, the Greek church rivals the barbariſm of the monkiſh ages.

In regard to diſcipline and government, the reſemblance of the Greek to other epiſcopalian churches, and particularly to that of Rome, may be eaſily conjectured. The ſame diviſion of the clergy into regular and ſecular, the ſame ſpiritual juriſdiction of biſhops and their officials, the ſame diſtinction of ranks and offices, is obſervable in both. Some points there are in which the diſcipline of the Greeks, who eſteem their own church the moſt ancient and orthodox, is particularly deſerving of notice. All orders of the Greek clergy inferior to biſhops, are permitted to marry. The married prieſts wear a fillet of white muſlin round their bonnet of black felt, and long beards univerſally, and are never promoted to a higher dignity than that of proto-papas of the church in which they ſerve. Celibacy, and the aſſumption of monaſtic habits, are indiſpenſably requiſite in thoſe who are candidates for the mitre.

In the Greek church, the regular clergy are generally men of a certain education, whereas the ſeculars are of the meaner ſort, and illiterate in the extreme. In that of Rome the reverſe will be found. The Greek monks, or caloyeri, follow only the rule of St. Baſil; their reſidence is on mount Athos, in Chios, and the Princes' Iſlands. Few convents of females are now exiſting; but in both ſexes the degrees of aſcetic proficiency is marked by peculiar habits. Their ſeminaries of education are eſtabliſhed at Mount Athos, and at the monaſtery of the Apocalypſe in the iſland of Pathmos.

Beſides the power of nominating the patriarchs of Alexandria, Antioch, and Jeruſalem, and all epiſcopal dignitaries, the patriarch of Conſtantinople enjoys a moſt extenſive juriſdiction, compriſing the churches of Anatolia, Greece, Wallachia, Moldavia, and the iſlands of the Archipelago; and for the adminiſtration of eccleſiaſtical affairs, a ſynod, convened monthly, is compoſed of the heads of the church reſident in Conſtantinople. In this aſſembly the patriarch of Conſtantinople preſides, with thoſe of Antioch and Jeruſalem, and twelve archbiſhops. Seniority ought to take the lead in theſe councils, but is too often overborn by ſuperior talents or habits of intrigue, and a majority is commanded by that prelate whoſe influence promiſes moſt to thoſe who ſupport him. But ſo ſlender and uncertain are the revenues of the patriarchs of Jeruſalem and Antioch, that they are obliged to reſide at Conſtantinople, and to depend in a great meaſure on the bounty of their ſuperior, who of courſe commands their ſuffrages.

Throughout the whole eccleſiaſtical ſtate, from the prelate or deſpotes to the parochial papâs, a material defalcation of their original income has occurred. The biſhoprics are univerſally charged with the payment, of the intereſt at leaſt, of large ſums, accumulated for ages, in conſequence of avaniàs levied on the patriarchate, to which each dioceſe is bound to contribute its quota. By ſuch burthens the revenues are ſo diminiſhed as to leave to the moſt opulent biſhop little more than three hundred pounds a year. The ſecurity given in theſe eccleſiaſtical bonds is deemed the moſt ample, and the rich Greeks truſt their money on them, at a lower rate of intereſt, in preference to commercial companies. The biſhops depend entirely upon a certain tax, levied upon each houſe within their diſtricts inhabited by Greeks.

The doctrine of the Eaſtern or Greek church, prevails at this day over a greater extent of country than that of any other church in the Chriſtian world. It is profeſſed through the moſt conſiderable part of Greece, the Grecian iſles, Wallachia, Moldavia, Egypt, Nubia, Lybia, Arabia, Meſopotamia, Syria, Cilicia, and Paleſtine; all which are comprehended within the juriſdiction of the patriarchs of Conſtantinople, Alexandria, Antioch, and Jeruſalem; to theſe, if we add the whole of the Ruſſian empire in Europe, great part of Siberia in Aſia, Aſtracan, Caſan, Georgia, and White Ruſſia in Poland, it will be evident that the Greek church has a greater extent of territory than the Latin, with all the branches that are ſprung from it.

The Armenian church is alſo a branch of the Greek church, profeſſing the ſame faith, and, till near the middle of the ſixth century, acknowledged the ſame ſubjection to the ſee of Conſtantinople. At that time the hereſy of the Monophyſites, ſpreading far and wide through the regions of Africa and Aſia, comprehended the Armenians among its votaries. It ſeems to be generally

nerally allowed that they differed from other communions of the Monophyſite ſect, and particularly from the Jacobites, in many points of doctrine and worſhip. By Gibbon they are called "the pure diſciples of Eutyches;" he affirms that they believe the manhood of Chriſt to have been of a pure incorruptible nature, and he imputes their converſion to Julian biſhop of Halicarnaſſus. But in theſe aſſertions there appears to be ſomewhat of inconſiſtency; for the hypotheſis of Julian and the Phantaſiaſts was not known, at leaſt did not prevail, among the oriental Chriſtians till more than ſixty years after the council of Chalcedon. On what authority then are we to believe that the phantaſian hereſy was the genuine doctrine of Eutyches? Sir Paul Rycaut, whoſe long reſidence both at Conſtantinople and Smyrna enabled him to acquire information in regard to the religious ſyſtem of the Armenians, gives the following ſtatement of the doctrines of their church. "They allow and accept the articles of faith according to the council of Nice, and are alſo acquainted with the Apoſtles' creed, which they have in uſe. As to the Trinity, they accord with the Greeks, acknowledging three perſons in one divine nature, and that the Holy Ghoſt proceeds only from the Father." He denies that the Armenian church is attached to the Eutychian or Monophyſite hereſy, and produces a tranſlation of its *tavananh* or creed in ſupport of that opinion.

Du Pin would inſinuate that the Armenians were reconciled to the Latin church at the council of Florence; but if we attend to the learned and judicious Moſheim, the ſcheme of comprehenſion projected in that council was completely fruſtrated, not only in regard to the Greek, but all the oriental churches. In the rites and ceremonies of the Armenian church there is ſo great a reſemblance to thoſe of the Greeks, that a particular detail would be ſuperfluous. Their liturgies alſo are either eſſentially the ſame, or are at leaſt aſcribed to the ſame authors.

The faſts obſerved annually in the Armenian church are not only more numerous, but kept with greater rigour and mortification than is uſual in any Chriſtian community. In addition to theſe, they faſt on Wedneſday and Friday throughout the year, except in the weeks before Eaſter and Aſcenſion day, and in that which follows the feaſt of the Epiphany. Their ſeaſons of feſtivity correſpond, in general, with thoſe of other churches, but they commemorate our Lord's nativity on the 6th of January, not on the 25th of December, celebrating in one feſtival his birth, epiphany, and baptiſm.

When the Armenians receded from the Greeks, they made no change in their epiſcopal form of church government: they only claimed the privilege of chooſing their own ſpiritual rulers, but continued to follow the ſame doctrines. The name and office of patriarch was continued; but three, or, according to Rycaut, four, prelates ſhared that dignity. Of theſe, the principal reſides at the monaſtery of Ekmiazin, near Ecrivan, in Perſia; his juriſdiction extends over Armenia Major, and he is ſaid to number among his ſuffragans no leſs than forty-two archbiſhops. His opulent revenues are conſidered only as a fund for his numerous charities; for though elevated to the higheſt rank of eccleſiaſtical preferment, he rejects all the ſplendid inſignia of authority, and in his ordinary dreſs and mode of living he is perfectly on a level with the pooreſt monaſtic.

Next in dignity to the patriarch of Ekmiazin is the catholic, who reſides at Cis, in Cilicia. The abode of the laſt is at Aghtainan, an iſland in the lake of Van. In the Armenian church, as in the Greek, a monaſtery is conſidered as the only proper ſeminary for dignified eccleſiaſtics; for they are required to practiſe abſtemiouſneſs in proportion as they are advanced. Hence, though their prieſts are permitted to marry once only, and uſually provide themſelves with wives whoſe health and youth promiſe long life, their patriarchs and maſtabets (biſhops), like thoſe of the Greek church, muſt remain in a ſtate of ſtrict celibacy.

The monaſtic diſcipline of the Armenians is extremely ſevere. They neither eat fleſh nor drink wine; they frequently continue in prayer from midnight till three o'clock in the afternoon, during which time they are required to read the Pſalter through, beſides many ſpiritual exerciſes. The orders or regulations by which they are governed, are thoſe of St. Gregory, St. Baſil, and St. Dominic. The laſt was evidently introduced by the Romiſh miſſionaries, who firſt gained a footing in Armenia about the commencement of the fourteenth century. But the abſtinence and mortification of conventual eccleſiaſtics is ſurpaſſed by the *gickniahorê*, or hermits, who devote their lives entirely to contemplation, dwelling on the ſummits of rocks. At the beginning of the eighteenth century, the preaching of the Jeſuit miſſionaries at Pera was ſo ſucceſsful in the converſion of the Armenian citizens of conſequence, that their biſhops applied to the Porte to procure their ſuppreſſion, or at leaſt to reſtrain them. When Ephraim the Armenian was telling the viſier of theſe encroachments of the catholics; "And what (ſaid he) are catholics but infidels? if the hog be white, red, or black, it is nevertheleſs a hog; we will not interfere."

Since the cloſe of the ſixteenth century, the Ruſſian church, ſomewhat ſimilar to the Armenian, has claimed a juriſdiction independent of the ſee of Conſtantinople. Nevertheleſs, appeals have been ſince made to that ſee in caſes of extraordinary importance. From the ſucceſs of the Ruſſian arms in their two former wars with the Turks, ſhould the Ottoman power be eventually ſubdued, it ſeems not improbable that the religion of the Greeks may once more be triumphantly eſtabliſhed on the ſhores of the Boſporus, that the creſcent may no longer profane the domes of Chriſtian churches, and that the patriarch of Conſtantinople may be reſtored to the dignity, though not to the power and influence, which he enjoyed at the moſt flouriſhing periods of the lower empire.—See Dallaway's Conſtantinople, 4to. p. 371–386.

GREEK FIRE, a ſingularly deſtructive combuſtible matter, frequently uſed in the ancient artillery, and ſaid to have been the invention of the architect Callinicus, in the reign of the emperor Conſtantine Pogonatus. For inſtances of its deſtructive operation, and method of firing, ſee the article ARTILLERY, vol. ii. p. 232.

GREEK ORDERS, in architecture, are the Doric, Ionic, and Corinthian; in contradiſtinction to the two Latin orders, the Tuſcan and Compoſite. See the article ARCHITECTURE, vol. ii. p. 68.

GREEK ROSE, *ſ.* in botany; the flower campion. See LYCHNIS:

Thy beauty, campion, very much may claim;
But of *Greek roſe* how didſt thou gain thy name? *Tate.*

GREEK VALE'RIAN, *ſ.* In botany. See POLEMONIUM.

GREEK'ISH, *adj.* Belonging to the Greeks, pertaining to the cuſtom or language of the Greeks. 2 *Mac.*

GREEK'LING, *ſ.* [A ſarcaſtical diminutive of *Greek.*] An inferior Greek writer.—Which of the *Greeklings* durſt ever give precepts to Demoſthenes? *B. Jonſon.*

☞ The Portraits of the GOTHIC and GRECIAN CHIEFS, given in this Volume, having been obtained from GEMS in the invaluable Collection of Mr. TASSIE, Leiceſter-Square, may be relied upon as AUTHENTIC.

The ADDITIONAL ENGRAVINGS now given, for the purpoſe of more fully elucidating various important Subjects in the earlier part of the Work, are to be placed by themſelves, until the NINTH VOLUME is completed; when full and ample DIRECTIONS will be given, together with the TITLE-PAGES, FRONTISPIECES, DEDICATIONS, &c. &c. for binding up the whole of the firſt Nine Volumes in an uniform and finiſhed State. This was intended to have been done at the preſent Time; but the labour in deſigning and executing the FRONTISPIECES, and the Claim of the ARTIST to place them in the ROYAL EXHIBITION, rendered it impoſſible for the EDITORS to fulfil the Promiſe made at the Completion of the SEVENTH VOLUME.

J. ADLARD, Printer,
Duke-ſtreet, Smithfield.
